TO CORRESPONDENTS

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

ity of signed articles, meetings costs of course.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the author.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for loss of drawings or photographs, or for alterations, comments, or for models or samples, sent to or left at this office, unless he has specially asked for them.

Drawings and photographs submitted for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Drawings and photographs, if not accepted, may be returned to the author, if he so desires, or to create or lend a drawing for publication, is given, subject to the approval of the article or drawing, when the author is asked to return it. If the author is not satisfied with the result, he may return it, if it is unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they are accepted or not.

. and 24 g.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100*l.* unless in some exceptional cases and for special reasons.]

CONCERNING BRUGES.

THE recent article in a contemporary* illustrating an artist's dwelling in Bruges is suggestive considerations wider than its immediate subject. Attractive as are private reserves, their charm, as author justly remarks, is for the illeged few, while it is in any case lined to a narrow area. Such vivid instances, however, naturally one on to a larger and more contentious question; none other, in fact, than that of the artistic fortunes and real conservation of a city which— Venice, like Nuremberg—holds a special place in the international world of art and architecture, and is familiar particular to English-speaking votaries. Is a question which in this day of age must awaken our most watchful rest.

Upon extending one's survey to the town large in its various aspects, one is by a strange conflict of conditions, left at last in a state of mind ugly tinged with dismay. Not Bruges has grown careless of her

history and her charms—far from it, as will presently appear; but she affords in the twentieth century the unusual spectacle of a city bent, on the one hand, on renewing her medieval youth, and, on the other, upon bringing herself into line with the latest commercialism. She is busied, in fact, in making the best of both worlds, the old and the new. The attempt is obviously hazardous: it irresistibly calls to mind the warning phrase *Ceci tuera cela*—where modern and medieval dispute the field. Not, again, that her chief memorials of the past can ever be seriously endangered, but that that rarer and more elusive thing, her old-world atmosphere, the relative integrity of age yet remaining to her, may be suffered—half unconsciously perhaps—to evaporate.

A recent writer of a descriptive volume has been pleased, following a popular tradition, to entitle the same "Bruges la Morte." Were she indeed so in certain modernist aspects, it need surely give no ground for real regret. For it seems hardly fanciful to suggest that cities and countries, even as individuals, have

a mission marked out for them by their character, circumstances, and traditions, a part to play in the world, a moral ideal to exhibit, with which even their material well-being is in a measure bound up. The vocation of Bruges would seem to be plainly declared by her past, and by its bequests through her to the present: to be the trustee of history and tradition, the witness to ancient art and ancient religion, the exemplar of modes of life and habits of thought which more modern communities cannot teach us—is not this a sufficient rôle, and are not such things, and nothing else, the lure that draws within her gates even yet the stranger from every strand?

Enough, however, of generalities; let us give specific proofs that regrets and anxieties are not groundless, at the same time allowing due weight to the more gratifying evidences which may meet us. Within the city the inroads of modernism are, so far, least noticeable. The street railway, indeed—an outrage unknown in industrial England—is an evil already of long standing, and now, it would seem, the electric tramway is to ply in

* See the *Connoisseur* for June.

thoroughfares which, up to the present, have scarcely peopled an omnibus. The widening, too, of the Rue Breidel at the heart of the town, the development of the plate-glass front in the larger streets, the stealthy removal of homely gables from the lesser ones and the like, are innovations serious enough. But it is on the fringe and in the approaches of the city—points that determine so largely its character, and give the traveller his first and last impressions—that the main mischief has been done. The prospect from the Minnewater Bridge is justly famed; yet even here one must be careful to look the one way, for on turning about one is confronted with extensive and unsightly ironworks built on the very brink of the canal, where till lately all was green and peaceful. At the other end of the city one cannot view the venerable gables of the Poterie without being *assommé* (the French word is apt) by a towering factory that dwarfs and vulgarises all its surroundings. The most widespread havoc, however, occurs on the neighbouring boundary of the town to the north, and is connected with the ship-canal scheme which would model Bruges on Manchester. Here a whole length of leafy rampart and curving moat have been remorselessly levelled and filled in and laid bare. Thereby the old *Porte d'Ostende* has been left half dry and wholly unscaled. It would be excellent work for the unemployed—if such there be in Bruges—

to restore the ravished waterway. Meantime the site thus treated—*terra deserta et inria et inaquosa*—has been thrown into the new suburb rapidly springing up all about it, and those who deplore this wholesale transformation must get what comfort they can from the sounding and romantic titles fitted to its leading thoroughfares—*Boulevard Marie-de-Bourgogne*, *Toison-d'or*, and the rest. Mention of the ramparts reminds one that of a score and more of windmills that once studded their grassy mounds, but a single one was left. A companion mill overturned some time since by a storm has never been re-erected; the site waits, and the old fabric is understood to be available—another chance for the restorer. It must be allowed that the steel telephone towers which now—they were the latest acquisition—challenge the eye from point to point through the town make poor proxies for these relics of a day when even mechanism was picturesque! What may follow in the wake of the diversion of the railway system now pending and in progress one cannot pretend to foresee; one can only deplore the attempt at monumentalism already apparent in this connexion; from the æsthetic point of view the only thing to do with a railway is to keep it as quiet and inconspicuous as possible.

Now to glance briefly at the other side of the medal. Let it be acknowledged, fully and gratefully, that in the majority of new and renovated buildings

local traditions of style have of late been followed, and with much success. The development illustrated by the "House of the Visitation" has been widespread. All praise is due to this remarkable revival of civil and domestic architecture embracing in some cases the accessories and crafts. Many new and excellent frontages both great and small, of agreeable design and tonality, are due to the movement; while many old ones have been restored to warmth and colour by the simple removal of whitewash. There is no doubt a tendency to over-elaborate and over-vary, especially in public buildings, which too often lack balance and repose displayed in the mediæval models, where symmetry was never lost sight of. This tendency nowhere more evident than in the great official block on the Grand' Place—pile due to an architect of ability now deceased, and at present receiving an interesting addition from another hand. In this case the splendid simplicity of the ancient *Waterhalle*, which formerly stood upon the site, might well have lent inspiration to the late designer.

One cannot speak of vanished monuments without recalling another danger. No town of antiquity is better documented than Bruges. Numberless plans and views from the XVth century onwards show us, though necessarily on a small scale, not only buildings now respectably ancient, but even the predecessors of these. Hence a temptation to "restore" and reconstruct wholesale on data really insufficient, and to supplement them at need by conjecture. It would matter less were existing authentic work left untouched in the process. But, alas, this is not so! Certain alterations, indeed, have been excellently conceived—for instance, the restoration of the "Academy" building to its original proportions. On the other hand we have in the west front of Notre-Dame a brand-new design, stiff and severe, to which the old façade, with its charming angle-turrets, has been ruthlessly sacrificed. That modernism should attain mediævalism is not surprising; but that antiquity should perish at the hands of its avowed admirers and imitators is grievous indeed. From the twofold danger thus confronting her, may Bruges—the Bruges of Memline and Van Eyck and David, of Blondel, of Caxton, and many memorable names and traditions—be in the hereafter preserved.

Those who dwell on the spot, to whose change comes piecemeal, are naturally less alive to it than those who revisit the city at intervals of time. But the many of the above considerations are realised by men of knowledge and standing within her own borders is explained in the pages of the recent monumental work of the archæologist and historian, Canon Duclos: "*Bruges Histoire et Souvenirs*." One welcomes the opportunity of offering from without some slight support to their position.

West Doorway, Notre-Dame, Bruges.

(From *L'Emulation*.)

RESEARCH HOSPITAL, CAMBRIDGE.

A research hospital is being erected in Cambridge for the Committee for the Study of Special Diseases, at a cost of some 2,000. The plans, prepared by Mr. Herbert V. Maguire, provide accommodation for twenty patients in a building which will also serve as a private residence.

NOTES.

Hygiene of the Eye.

At a luncheon given recently by one of the leading electrical companies to representatives of the Press Leon Gastier, referring to what has been done as regards electric lighting, what they sought to do, made use of a phrase which should find its place among those that throng, under modern conditions, round the architect of to-day. "Hygiene of the Eye" bespeaks an attitude of mind forced upon us by the very considerable perils which beset our most delicate organ to an increasing degree. It is still assumed in an entirely critical and undiscriminating way that the maximum of light in any circumstances is the object of human desire, and the condition of human welfare. The majority of modern dwellings on city sites are overlit even in the daytime, and at night the chilly glare of incandescent burners and the hard brilliance of the filament lamp in our public places, in the streets, in the taverns, and even in the parlours of our homes, wring from the eye the recuperative restfulness which is intended by Nature to supply the brilliant and whiter light to an even more intolerable degree is still the desire of the manufacturers, and one which we must suppose, though it is doubtful really, to be the desire of the public. The necessary consideration of the hygiene of the eye has been discovered, however, in scientific ways at persons of taste and sensibility have always known. In our modern apartment houses light from electric lamps is rendered as innocuous as may be by the use of sheathing and shades of softly coloured silk, and candles are extensively used. The student has learned to turn to his oil lamp. We would not be surprised if a fair-minded consideration of illumination from the point of view of the scientist were to arrive at the conclusion that a light of this character is the ultimate desideratum.

London Water Supply. THE annual reports of the Water Board and of Dr. Houston, their Water Examiner, form a highly satisfactory reading. Without going to a far country for supplies or undertaking any specially heroic measures for the same purpose, London has an abundant quantity of pure and wholesome water, derived from a polluted and long-suffering river. The population of more than seven millions was supplied last year with 31.57 gallons per head daily, representing the aggregate volume of 82,170 million gallons for the period ending March 31. Dr. Houston's report confirms the conclusions previously stated as to the purifying effects of storage on a large scale. So effective is this process that it is practically impossible to detect the germs of water-borne disease in raw water which has been stored for a comparatively short time. As Dr. Houston says: "Storage is Nature's method of purification without the addition of any purifying agent to the water." Beyond this safeguard, now generally applied, thanks to the magnificent reservoirs of the Water Board, we have the further purification effected in sand filters, where 98 or 99 per cent. of the remaining

organisms are removed. Comparing their abundant supply of pure water with the inadequate and somewhat questionable supplies available in Paris, Londoners have every reason for gratitude to the Metropolitan Water Board and to the old companies by whom were laid the foundations of the present incomparable system.

New Method of "Building." THERE come—from the United States, of course—photographs of the erection of a church in four slabs. On the foundation wall and on piles inside the boundaries of the site a series of steel jacks is laid down. These jacks consist of a supporting carriage, a pivoted walking beam, and a collapsible screw driven by a worm gear and worm. A platform is laid on the jacks, and on this platform the design of the façade is laid out; all door-frames and window-openings are set in this position, and the concrete is packed round them. The whole wall is cast at once, allowed to dry, and slowly raised till it is perpendicular. The quoins are finished, the roof applied, and a "church," or anything else you will so long as it be formed of plane surfaces, is the result. This is undoubtedly practicable, and a legitimate

extension of the collapsible summer-house, itself derived from the packing-case, all being logical and simple methods of enclosing cubic space. However, be the design as perfectly proportioned and harmonious as it may, let no one imagine that architecture is involved.

Strikes and Electric Lighting. THE strike of workmen at the Liverpool power station draws attention to the need of amending

the Conspiracy and Protection of Property Act, 1875, to bring it into line with modern requirements. Sect. 4 of that Act contains special provisions relating to employees of a municipal authority or of any company or contractor upon which is imposed by Act of Parliament the duty of supplying any city, borough, town, or place with gas or water who wilfully or maliciously break contracts of service knowing or having reasonable cause to believe that the probable consequences of such breach will be to deprive the inhabitants wholly or to a great extent of their supply of gas or water. Electric light has in many towns and districts superseded gas, and the reasoning which made special provisions desirable in regard to employees employed in supplying gas under statutory powers applies

West Front, Notre-Dame, Bruges.
(From *L'Emulation*.)

with equal force to employees engaged in supplying electric light under similar conditions, yet we are not aware of any statute which extends the provisions of sect. 4 of the Conspiracy and Protection of Property Act to workmen engaged in the supply of this modern necessity of life—electric light. Possibly the section could usefully be extended to other statutory undertakings as well where public interests are concerned.

A Lesson of the Strike.

WHILE congratulating ourselves upon the cessation of the railway strike it is impossible to escape one disquieting reflection. Mr. Lloyd George's scheme of 1907, which was generously acclaimed by all parties, and accepted by both masters and men, should have rendered this national strike impossible. Unfortunately, it seems to have shared the fate of many an international treaty. The last chapter in the history of such an instrument too often records its destruction at the hands of one of the signatories who had become dissatisfied with its working. It would appear that in these industrial conflicts the most perfect scheme of settlement—should it fail to turn out as advantageous in its effect as had been anticipated when it was drawn up—cannot be relied on for a lasting peace. Signed agreements may be ignored or repudiated, and an ancient warning slightly paraphrased aptly applies to this modern situation—"Put not your trust in treaties nor in any scheme of man's." Our readers will notice that they are touched most closely by the closing paragraph of the Instructions to the Special Commission of Inquiry which has been formed—"The Government have promised the railway companies legislation providing that an increase in the cost of labour due to the improvement of conditions for the staff would be a valid justification for a reasonable

general increase of charges within the legal maxima, if challenged." Reading between the lines the manufacturer and trader will be prepared to find a share of the burden laid upon their shoulders—as usual.

THE STORY OF THE BRIDGE.

By WALTER SHAW SPARROW.

III.—MEDIÆVAL.

TO ENCOURAGE the making or the upkeep of bridges was counted as an act of piety in mediæval days, "a blessed besines," a charitable duty, essential to the safety of pilgrims and wayfarers; so bishops and abbots, to bring this matter home to lay minds, granted remissions of penance to those (and they were many) who forgot that the King's highways had to be kept in order by every landlord who owned property in their neighbourhood. This, in theory, was part of the *trinoda necessitas*, but landlords often shifted the obligation from themselves to their tenants, who kept their conscience quiet by having no dislike for a bad memory. Then the law became busy, trying to fix blame on the right persons; and as the law, then as now, halted for many "refreshers"—greedy thing!—the church, more active by far, gave practical help, granting "forty days indulgence to all who would draw from the treasure that God had given them valuable and charitable aid towards the building and repair" of some poor bridge or other. But there was no fun in this; the fun began when justice, having come to a definite decision, told the bailiff or the sheriff to be aggressive in right directions. If landlords or their tenants declined to pay what they owed to the bridge, then some of their property was seized—a horse, a cow, a flock of geese, something saleable, in fact; as in the case of Hamo de Morston, of Old Shoreham, in Sussex, who in the eleventh year of Edward II. made a great outcry because a bailiff, good Simon Porter, had not only taken a horse from him but sold it for the benefit of the venerable timber bridge. Hamo appealed against this act, but without success. A little historic immortality he did gain, but nothing useful to himself.

And I am glad—very. It was men of his

type who in the Middle Ages disfigured the architectural history that bridges ought to have handed on unharmed from generation to generation. They were not so bad as the industrial spirit which during the last century has played havoc everywhere, destroying ancient bridges as if they were evil things; but whether the Hamo de Morston belongs to this age or to another, he is always a pretentious fool. Think of the interest which Old London Bridge would excite to-day if it had been kept as a great historic monument. When Samuel Scott painted it in 1745 it was still a romantic street, with houses and shops; and at the time of its final destruction, in the year 1831, when New London Bridge was opened to circulation (after costing 1,458,311*l.*, by the way), its value as a show-place was a legacy from the long ago which ought to have been delivered down, properly renewed, to our shillings and sixpences. But modern trade has ravaging ambitions, and criticism has no more effect upon it than bullets have on a target. We must consider ourselves fortunate that although in England there is not even one old bridge equal in importance to many on the Continent, yet we do find good examples of mediæval bridge-building, particularly in districts where there has been but little increase of traffic. We possess bridges with defensive towers and bridges with chapels, as I shall show in my next paper; and some good specimens exist of bridges with triangular recesses built out from the parapet and forming a part of the piers. These were designed not only as shelter-places for wayfarers, but also because they lessened the cost of bridge-building, inasmuch as they gave width and convenience to a narrow roadway, so that their value in this work is very similar to that which bay-windows have long had in the planning of rooms.

By way of example I give the famous Llangollen Bridge, with its four unequal arches, and its look of bluff vigour in old age. It comes down to us—a little widened, thirty-three years ago—from John Trevor, Bishop of St. Asaph, who died in 1357, and whose workmen did not care a rap for uniformity of design. What they liked was a secure foundation for each of their piers, and it saved time and expense to sound the river-bed and to build from the flattest places in slippery rock. The widest arch would have

Llangollen Bridge, XIVth Century.

Chinese Bridge.

[Photo. by Mansell, London.]

span of 28 ft., and the two smallest ones could occupy the central position. But the main point, after all, was to do such work as could withstand the fury of a gathering flood. In this one matter the craftsmanship was a complete success. But there is no ambition, no imagination, in the design of Llangollen Bridge. It conquers the dangerous waters, but in a stubborn, dull fashion. It has the look of Hodge in armour, heavy and dogged, dauntless and lumbering. And this applies to many a British bridge having a long history. The one over the Tyne at Dumfries, which was long considered the finest after Old London Bridge, is a damaged exception, dating from the XIIIth century. Formerly it had thirteen arches—an unlucky number, perhaps, for only seven are now in use. There used to be a high aspiration in the design, a certain triumph over difficulties and perils, and for the remains of this quality we have reason to be grateful.

Old England used to speak with delight about a certain beauty described as "faerie," a certain grace that aspired with an air of heroic life, as if it came into the common world from that enchanted time when King Arthur ruled. It is just this faerie magic that old English bridges lack. They are good pedestrian bridges, often enough, but the great poetry of Gothic art, its easy triumph and upward flight, is absent as a rule. Here and there we come upon a half-exception, to the ever-famous Tyne Bridge, Northumberland, which has changed but little since Lord Surrey threw his army across it to reach Flodden Field, turning the flank of the Scotch hosts.

It is a graceful piece of architecture, alert

and wideawake; it has one strong arch, with a touch of the XIIIth century in its semi-circular span, which measures 90 ft. 7 in. from abutment to abutment. The parapet from its centre shelves downwards at each side, its greatest height from the waters of the Tyne being 46 ft. 2 in. I note, too, that the arch is groined and ribbed, quite a common trait in mediæval bridge-building, above all, in Poitou and in England. Viollet-le-Duc mentions this kind of arch, and says that the groins, separated from the bed of the road by a space filled with loose flagging, were *posés en rainure dans les piles en conservant une parfaite élasticité*. All rain-water that found its way through the road passed with ease between the joints of the flagging, without leaving a deposit of saltpetre on the haunches of the arch; and, as the work was lighter than in other arches, there was less pressure on the piers. Moreover, this system of arch-building, which dates from the end of the XIIth century, or from the beginning of the XIIIth, was more economical than any other, employing one-third less of keyed materials. The spandrels above these groined arches were of ashlar, and it was easy to repair them without interrupting traffic.

Another distinguishing characteristic of mediæval bridges is what the French call the *dos d'âne*, the shelving parapet and roadway on either side from a point just above the keystone of the central arch. It is often supposed that this trait is European, yet it is found also in Chinese bridges, which are very graceful at their best, pure and strong in design, and having fine arches in which the semicircle is prolonged without forming a true horseshoe. I have chosen a

Chinese bridge as an illustration, and set it side by side with two Spanish examples, the Puente de San Juan de las Abadesas at Gerona, and the Puente Mayor over the Miño at Orense, Galicia, which, to my mind, is the most stately of all shelving bridges. The Moors left in Spain a peculiar grace of style which native architects often united to their own qualities, a haughty distinction and a lofty ambition. Consider the immense nave in the Gerona Cathedral, a glorious pointed vault measuring not less than 73 ft. from side to side, almost double the width of Westminster nave. It belongs to the XVth century, yet in the magic of its youthful hope it proves that its architect, Guillemo Boffi, was a child of the XIIIth. And the great central arch of the Gerona bridge has in it some of the soaring courage that transcends all expectation in the cathedral nave.

This bridge, with its look of battered antiquity, is certainly very fine, but less majestic than the masterpiece at Orense, a stone bridge of the XIIIth century, with seven elastic arches, all alertly dignified, and with a total length of more than 1,300 ft. The great central arch is 156 ft. wide between the piers, and its keystone is 135 ft. above the river-bed. "The Miño rises rapidly and to a great height," says Walter Wood, in "A Corner of Spain"; "and it was with the object of safeguarding the bridge against the sudden inundations that the arch was made so high."

True: and this brings us to the origin of those bridges that shelf down at each side from a point in the centre of their parapets and footways. Two useful purposes were served by making the central arch wider

The Puente Mayor over the Miño, Orense.

[Photo. by Lacoste, Madrid.]

and higher than the others, since there was greater space for navigation as well as for waters in flood; but when a bridge had only one arch its up-and-down roadway was usually inconvenient, because the incline was not long and gradual, but short and steep. Take the Pont-y-Prydd, near Cardiff, built in the XVIIIth century, and having a pathway so abrupt in its slope that laths of wood used to be stretched across it as a foothold for horses. In frosty weather a shelving bridge was often a breakneck place; and there is evidence that architects at an early date told each other that their departure from the Roman tradition of level bridges was undignified. It was a tradition not without exceptions, since the *dos d'âne* was used at times by Roman bridge-builders; but a level causeway was more typical of Roman craftsmanship, and it influenced medieval architects and engineers. Among my illustrations is a good example, *Le Pont des Consuls* over the Tarn at Montauban.

Here is a noble monument of the XIVth century, and its history brings before us a good many of the hindrances to bridge-building that held sway over craftsmen in the Middle Ages. Whenever a bridge would connect the lands of rival lords or of jealous provinces or counties, its construction was resented and opposed; when built, determined efforts were often made by one party to hold it against the other; and sometimes a great fortress was put up at each end, commanding the entry. Though the village of Montauban was founded in 1144, by Alphonse Jourdain, Comte de Toulouse, and though the founder ordered that a bridge should be made at once and kept in proper repair for the inhabitants, yet nothing was done for many generations. Sometimes poverty was pleaded as an excuse, and sometimes the Albigeois wars; delays breed excuses invariably. But at last, in 1264, the good men of Montauban became active, and in 1291 they bought the island of Castillons or of Pisotte to serve as a foundation for some of the piers; but even then their efforts would have given way but for Philippe le Bel, who asserted his authority as King, appointing two consuls as overseers, and commanding that a tax was to be levied on all visitors to Montauban as a means of raising funds for the bridge-building. Three strong towers were to be built on the bridge, one at each end, the other in the middle; and these towers were to be guarded for the King by Royal troops. These commands were given in 1304, when Mathieu de Verdun and Etienne de Ferrières were consuls. Yet nothing much was done. The bridge seemed to creep into existence, for it was not finished till 1335. Still, the design was boldly good and the craftsmanship was excellent.

It is a bridge entirely of brick, 250 m. 50 cm. in length. The bricks are excellent in quality, and measure 5 centimetres in thickness, 40 centimetres in length, and 28 centimetres in width. The roadway is perfectly level, and its height above the level of the Tarn is 18 metres. There are seven pointed arches, having an average span, or chord, of 22 metres; and the six great piers with beaked buttresses are 8 m. 55 cm. in thickness, and note how they are pierced with high arched bays to facilitate the passage of water during floods. The defensive towers have gone, but the strongest ones of all was built at the end facing the town. It was square in shape, and its summit was a platform with crenelles and machicolations. The other end tower was a weaker version of this one, while the central defence, built over the middle buttress on the side looking down the river, was triangular, and there was room enough in it for a chapel. A flight of winding steps went down to a postern pierced through the buttress at the water's level; and at the other side of the pier, just below the arched bay, hung a sort of see-saw that carried an iron cage in which blasphemers were put to be ducked in the river.

FORTY-SECOND ANNUAL EXCURSION: TOURNAINE.

IN 1905, the last occasion on which the A.A. Excursion visited France, the headquarters were at Lisieux, and by the selection of old Tournai as the district for this year's excursion a very different objective was ensured. Around Lisieux the country is rich in brick and half-timber cottages and small manors, while Tournai shows an unequalled series of medieval and Early Renaissance stone châteaux and mansions. The district is one rich not only in architectural remains, but in historical associations, and has an added interest for Englishmen as having formed part of the dominions of our Angevin kings, whose hearts, indeed, were generally here, where with plot and counter-plot they sought to secure and extend

their French dominions. The country to this day an enduring testimony to character of the feudal system, under which the great territorial nobles waged continuous war with one another, combining and combining with bewildering changefulness the great game. In a later epoch most of the feudal castles became hunting boxes, the nobles remained. Up to the time of Francis I., under whom the Court of Burgundy migrated to Paris (where under later kings it finally settled), Tournai had been the centre of political France, if a centre it could be said to have. The Court for centuries moved to and fro among the pleasant châteaux in the valley of the Loire.

Between Blois and Saumur, a distance of about eighty miles, the Loire receives from the south four tributaries, the Cosson, the Cher, the Indre, and the Vienne, and the country so watered was covered until the end of the XVIIth century with a multitude of châteaux, not only the frowning towers of feudalism, but the more gracious elegant abodes raised by the nobles of later days. The wars of religion and of the Fronde accounted for some of them, the great Revolution destroyed more, but still a great number remain, a tribute to their excellent solidity and to the enduring qualities of the fine building stone with which they were constructed.

Whether consciously or not, the Honorary Secretaries in arranging the excursion laid down a programme almost exactly similar to that of John Evelyn, who visited the Loire Valley in 1644. He also stayed for a few days at Blois, passing on from thence to Tournai, "where," he says, "we were design'd for the rest of the time I had resolv'd to stay in France, the sojournment being so agreeable. His method of progression, however, though less expeditious, was the more picturesque for "he took boats on the Loire," where, in later days took train or motor to reach the various châteaux on the banks of the river and its tributaries.

The party arrived at Blois on the morning of Saturday, August 12, having travelled all night. This arrangement, though much to be preferred owing to the great heat, necessarily prevented a very active spirit on the first day, and the time was spent in leisurely exploration of the town. Beside the chateau it contains much interesting work. The fine abbey church of St. Nicholas attracted, perhaps, most attention. Built by the Benedictines between 1135 and 1210, it has all the refreshing freedom of early pointed work, before planning and design had fallen too much into orthodox lines, and it suffered little from restoration. The choir transept, and easternmost bay of the nave are the earliest work, and show very beautiful Byzantine carving and other curious Romanesque details. Very interesting is the plan of the east end. The choir is two bays long beyond the central tower, with double aisles on either side, the outermost forming the chapels opening out of the transept. The apse is divided in seven narrow bays by cylindrical shafts carrying pointed arches, and from the ambulatory which encircles the choir, three chapels, the central one of which has been rebuilt and lengthened late in the XIIIth century. It is now two bays long with a polygonal apse and large geometrical windows. Previous to this extension the external effect of the clustering chapels would have been better seen, the apses of the long transeptal chapels and those of the chevet coming into relation with one another. The low central tower contains an interesting lantern in the form of a ribbed dome springing from a circular arcade on pendentives, which may be derivatives from Fontevault. The nave, slightly later in date, with plate tracery in the clearstory, is of five bays, the westernmost, between the twin towers, having a low-vaulted gallery, inserted in the XVIIIth century, carrying the organ. All the church is stone vaulted. The western front is striking and well seen from a little distance. Its twin towers are aggressively unequal in spacing, but recover their effect in relation in their belfry stages, each consisting there of an open double arch on each face without louvres. All three towers are surmounted by slated spires of not very convincing form. The western portals have been severely damaged, but are fortunately unrestored. The cathedral of St. Louis, fine

on the stonework. The columns round the drum of the fantastic central lantern display entasis in a particularly obnoxious form, and there are numerous other lapses in detail. The château is, nevertheless, a building on no account to be missed, and well repaid the trouble of visiting under rather trying conditions.

A long drive in a south-easterly direction from Blois is ordinarily the means of reaching the Château du Moulin, but owing to the tropical weather no coach would undertake the task. The train had therefore to be taken as far as Romorantin, and the château reached from thence by road. The house is a beautiful and complete specimen of very early Renaissance manor, built in 1480 by Pierre du Moulin. The design is said to be due to Jacques de Persigny, and includes a number of the inevitable round towers with their extinguisher roofs and an encircling moat with drawbridge. The construction, like most of the latest medieval domestic work, is of brick and stone. The house is approached on the north side through a gateway tower flanked by lofty turrets pierced only with oilets. The wing westward of the entrance is incomplete, but that to the eastward, uniting the gatehouse to a circular corner tower, shows the intended form. The house proper stands entirely within the square formed by the curtain wall, and is a lofty structure, consisting of two rooms on each floor, with a staircase tower to the east and a circular-ended turret opposite on the west face. A tiny oratory, containing in its traceried windows some beautiful old glass, opens northward from the hall on the ground floor. The house has been restored in recent times, but has not greatly suffered. It now contains some very beautiful old furniture. The return to Blois was made from Mur de Sologne, where a brief stay was afforded to examine the rather curious little church with fantastic slated spire and simple octagonal apse of good proportion.

Second Day—Tuesday.

A short railway journey, followed by a walk of about a mile, brought the excursionists to the entrance lodge of the Château de Chaumont, at which it was intended that the working day should be spent. In the troublous times of the Middle Ages Chaumont was an outpost of the Counts of Blois against their formidable enemies the Counts of Anjou and Touraine. Previously to the present building, which is a semi-fortified château built by Charles, brother of the Cardinal d'Amboise, about 1475, two feudal castles successively had been razed to the ground in the interminable wars of the rival nobles. The new château was originally a complete quadrangle, but the fourth side, towards the river, which was in existence in 1681, was pulled down by M. de Vaugien, a Parisian magistrate, to whom the domain belonged in 1739. By so doing he opened up the view over the Loire Valley, with (in the foreground) a "sweete island, deliciously shaded with tall trees," which the author of "Sylvia" noted when passing "Charmont, a proud castle on the left hand" (of the Loire), in the course of his foreign tour. The building stands high above the river on a precipitous slope, and is approached somewhat curiously from the high ground behind by a gatehouse and drawbridge placed obliquely so as to enter at the angle of the courtyard. Flanking the gateway are two round towers with conical roofs, known respectively as the Tour du Roi and de Diane. At the north-west angle the tower of Amboise is largely of the earlier building, while at the north-east is yet another round tower. On the right of the entrance is a carved panel containing the shield of arms of Charles d'Amboise, and on the left those of his brother the Cardinal. Encircling the building is a curious frieze of emblems said to represent volcanoes as a rebuts of the place's name, alternating with a monogram of Charles and Catherine de Chauvigny. A fine polygonal tower facing the courtyard to the right of the entrance contains the escalier d'honneur, a spacious spiral stairway, flamboyant in all but its minor details. Mounting this stair and passing through the guardroom, the council hall is next reached. Here the attention is arrested by a remarkable floor of faïence, said to be from Palermo; interesting but not wholly satisfactory. In 1569 Catherine de Medici bought Chaumont, which she held until the death of Henry II, when she compelled Diane

de Poitiers to render up Chenonceaux in exchange. Chaumont somehow escaped the troubles of the Revolution, and contains a splendid collection of old furniture and tapestries, much of it original; Catherine's chamber in particular has very fine tapestries. Opening from this room is the chapel with gallery and shallow apsidal recesses converting it to a Greek cross plan. Adjoining is also the chamber said to be that of Ruggieri, Catherine's astrologer and poisoner, whose cabalistic signs are seen repeatedly about the castle. In his room is a fireplace with back lined with Delft tiles, which is the most pleasing detail seen in the building. Diane de Poitiers did not favour Chaumont, preferring her château of Anet, but her room is also shown, with a tile floor bearing her badge of interlaced crescents. The property is now owned by the Princess de Broglie, who jealously guards it.

Leaving Chaumont earlier than had been intended, owing to permission to sketch being withheld, the train was taken from Orléans to Tours, the headquarters for the remainder of the excursion. Always a place of considerable importance since Roman times, when as Caesarodunum and afterwards Urbs Turonum it became the capital of a province, it is now a thriving city of some 70,000 inhabitants, and contains many fine buildings, modern as well as ancient. The railway terminus and the Hôtel de Ville, by Laloux, are among

the most notable of the modern buildings, and both gain full effect from their setting, which is one of the things that "they manage better in France." There are other instances in the town of attention to town planning in the sense which it is so hard to get our English local authorities to recognise. The approach to the Pont de Tours by the fine open Place du Musé, with broad tree-shaded quays extending on either side, is one such. The many interesting ancient buildings of the city were necessarily given but scanty attention, owing to the demands of the programme of outside visits, which left but little time. The Cathedral of St. Gatien perhaps received most notice. This is the third church which has stood upon the site. Tours, it must be remembered, was the cradle of Gaulish Christianity. St. Gatien to whom the cathedral is dedicated, was a missionary, but the second bishop, St. Sidonius, began the first cathedral, in which his successor, St. Martin, ministered. This was dedicated to St. Maurice, and when burnt in 561 was rebuilt by Gregory, to be again burnt in 1166. The present building was begun in 1170, and by 1260 the greater part had been finished and rededicated to St. Gatien. The western bays of the nave with the west front are of the XVth century, the towers having been begun in 1426. They are of unequal height in every stage, and terminate in Renaissance double cupolas completed in 1500 and about 1550.

The Château, Chenonceaux.

respectively, 220 ft. and 226 ft. above the pavement. The flamboyant bays of the nave have some marvellous tracery embodying the fleur-de-lis, both in the glazed triforium and in the clerestory, and the stained glass in the church is very fine, though apparently much restored. How fine it could be is shown by the lower lights of the north transept rose, which as a sumptuous but not garish piece of colour is wellnigh perfect. Though the proportions and organic completeness of the structure are admirable, it is hard for English eyes to be wholly satisfied with the articulation of parts, the clustered piers, their capitals, and the arches they support appearing to lack that relevance characteristic of the best English work. Among minor details is a fine organ of the early Renaissance, occupying the end of the south transept. The lovely tomb of the children of Charles VIII., carved by Jean Juck, is very charming. Adjoining the north transept of the cathedral is the cloister of the Palette with its beautiful little stair turret. The Church of St. Julien, near the Rue Nationale, is a fine edifice of the XIIIth century, with a western tower of the Xth century, which does not rise so high as the ridge of the later church. The plan is remarkable, having a square east end with large eight-light window quite in the English manner, though this is the only English feature, the short choir of three bays, narrow transepts not rising to the ridge, and triple vault shafts which are corbelled above the capitals of circular columns in the choir, and stand upon the capital of a single shaft in the compound piers of the nave, being all thoroughly French. It is only in recent years that this church has been restored to its original purpose; it is not long since it served as stables to a hotel. Of the great XIVth-century Church of St. Martin only two gigantic towers remain, separated by a street which was formed when the rest of the building was demolished in 1802. The Tour Charlemagne adjoined the north transept of the church and the Tour de l'Horloge formed part of the west front. Very few members found time to discover the Churches of St. Saturnin or St. Symphorien, and the former Church of St. François de Paule (now an American Kinetograph theatre) was inaccessible; the latter is a bold but rather coarse example of late Renaissance design. The house of Tristan l'Hermitte, the Hôtels Gouin and de Beaune, and several other notable buildings were not seen, but several members visited the former Hôtel du Consulat (now Palais du Commerce), attributed to J. H. Mansart. This building has an interesting courtyard, which derives a pleasing and individual character from the quadrant curved angles of the side facing the entrance. It is an excellent example of simple and restrained design. The street fronts of the more modern parts of Tours afford an admirable proof of the sufficiency of simple methods of design in the production of satisfactory town architecture. Most of the buildings are of two stories above the ground floor, with dormers above the main cornice. Quite usually the only ornament is in the wrought-iron balconies, most of which are very good, but all the details are well judged, and the total effect very sober and dignified.

Third Day—Wednesday.

The site of the Château de Chenonceaux appears to have been occupied in early times by a Roman villa. Later a feudal castle stood upon it and possessed, as an appanage a watermill. The Marques family, to whom it belonged, sided with the English in the wars of the early XVth century, and as a reward Jean Marques's fortifications were razed by Du Guesclin. His successors, in their efforts to rebuild, got deeply involved in debt, and their property passed to Thomas Bohier, a rich financier, who, with his wife, Catherine Briconnet (daughter of Cardinal Briconnet), at once proceeded to demolish all existing buildings save the round tower, still standing detached beside the main entrance, and to rebuild in the newer fashion. The new work was complete in 1517, except the bridge across the Cher, which was added by De l'Orme for Diane de Poitiers about 1566. The château came into the possession of the mistress of Henry II. after it had become a royal domain under Francis I., consequent on the usual fate of Royal financiers. On Henry's death in 1559 Catherine de Medici ousted Diane. Evelyn visited the castle in 1644, and wrongly ascribed the whole building to Catherine, who only added or completed the stories over De l'Orme's bridge spanning the Cher. This bridge gallery was intended to form the connecting link

between Bohier's house and another block of similar mass proposed to be erected on the eastern bank of the Cher, but, like so many ambitious schemes, it remained incomplete. The main block of the château shows the usual hybrid details of its time, and in so far as its qualities approximate to the mediæval is successful, but rather in spite of than by the aid of its Renaissance detail. The plan is of the simplest, and its charm seems due solely to the manner in which the structure is thrust forward into the very bed of the river, utilising the foundations of the old mill. A curiously vaulted corridor cuts the building in two, two rooms to the right and two to the left filling out the rectangle of the plan, which has the usual circular tourelles at the angles. The left-hand rooms communicate with two octagonal ended projections, one of which contains the chapel, with some good contemporary glass. The long gallery of Philibert de l'Orme, about 200 ft. by 20 ft., is a characteristic example of that master's ingenious detail and technical knowledge of construction. North-west of the château are fine sunk gardens, looking somewhat parched in the severe drought. After spending about three hours at Chenonceaux, the party proceeded by road to Amboise, the long drive through undulating country being very pleasant.

Of the once splendid Castle of Amboise only the outer walls, with two round towers, the small chapel of St. Hubert, and two proportionately insignificant, though still considerable, blocks of buildings are now standing, the greater part having been destroyed shortly after the Revolution. For knowledge of its perfect condition we are compelled to rely on Du Cerceau's drawing, which shows a strange medley of Gothic and Renaissance elements. Charles VIII. planted here, in 1495, the first colony of Italian artists and craftsmen, from whose fusion with the native school, reinforced by the subsequent introduction at Fontainebleau of a fresh hand by Francis I., the characteristic French early Renaissance sprang into being. In the centre of the castle inclosure stood the mediæval collegiate church of Notre Dame, in which Leonardo da Vinci is said to have been buried, but this, in common with other buildings, has vanished. Louis XII. and Francis I. continued the works commenced by Charles, but later kings added little, and in the condition in which it was left by them it remained until the Revolution. Since the destruction which it then underwent the portions remaining have been restored at intervals, the chapel of St. Hubert having been first repaired under Louis Philippe. The buildings have lost interest in the process, but their historic associations (mostly of a sanguinary nature), and one or two beautiful and unspoiled details, still render them attractive. Perhaps the most beautiful thing remaining is the inclined vaulting supporting the sloping way in the Tour des Minimes, which, as Evelyn remarked, "is large enough and sufficiently commodious to receive a coach and land it on the very towers, as they told us had been done." The gallery overlooking the river, from which Francis II. and his bride, Mary Queen of Scots, watched the massacre of some 1,200 Huguenot conspirators in 1560, is shown, but the whole of the river front has been almost rebuilt, and is very different in appearance either from Du Cerceau's drawing or the fine plate in Petit's "Châteaux de la Loire Valley." Beside the castle there are in Amboise a XVIth-century Hôtel de Ville, the two churches of St. Florentin and St. Denis, and an old city gate (La Porte de l'Horloge), but time permitted no more than a hurried inspection in passing.

[To be concluded next week.]

GENERAL NEWS.

Notable Houses in London.

A tablet will be affixed upon the front of No. 12, Seymour-street, Portman-square, W., to commemorate the residence there of Michael Balfe.

Departmental Committee: Royal College of Art.

The Committee, to whose report we adverted in our last week's number (pp. 160-1), consisted of Mr. E. K. Chambers (Chairman), Principal Assistant Secretary, Technological Branch of the Board of Education; Sir George J. Frampton, R.A.; Mr. Halsey Ricardo, F.R.I.B.A.; Sir Charles Holroyd, Director of the National Gallery;

Sir Kenneth S. Anderson; Professor Fredk. Brown; Mr. W. Burton, F.C.S.; Mr. Douglas Cockerell, and Mr. Frank Warner.

King Edward VII. Memorials, Marienbad and Homburg.

The memorial which the British visitors have erected in the British Church at Marienbad consists of a tablet of giallo antico marble bearing a wreath of the rose, thistle, and shamrock, in high relief, over which is a bronze medallion of the late Sovereign sculptured by Mr. Stirling Lee. The design of the memorial is by Professor Lechaby; the carving was executed by Messrs. Farmer & Brindley. The marble tablet and bronze relief portrait that have just been placed in the British Church at Homburg were sculptured by Professor Gerth.

Scheme for East London College and People's Palace, Mile End.

The Charity Commissioners have framed a scheme for the future regulation of the People's Palace, an outcome of the original Beaumont Trust, of 1840. The Commissioners set up a body of fifteen governors for administering the charity and endowments of the East London College; they ordain that the Drapers' Company, who are represented upon the Council, shall pay 7,000l. per annum to the governing body, with the option of commuting that subsidy for a capital sum of 30,000l. to be applied—if University education is then being carried on there—to the future maintenance of the College as the Board of Education may by scheme direct.

Sir Redvers Buller Memorial, Winchester Cathedral.

The memorial erected to Sir Redvers Buller by the King's Royal Rifle Corps, his comrades of both services, and other friends, will be unveiled in the north transept, Winchester Cathedral, on October 28. The recumbent effigy, in bronze, upon a bed of green and black marble, is by Mr. Bertram McKennal, A.R.A.

Whiteley Homes Trust.

The trustees under the will of the late Mr. William Whiteley have decided to purchase from Lord Iveagh about 220 acres of land near Walton and St. George's Hill, Surrey, for the establishment of the Homes, with church, sanatorium, and administrative buildings. The land includes a portion of the Burgh Hill estate, is well wooded, and has a soil of deep sand and gravel.

Dyserth Castle, Flintshire.

In their second report, which has just been issued, the Royal Commissioners upon the ancient and historical monuments and constructions in Wales direct attention to the injury which is being inflicted, through quarrying operations, upon the remains of Dyserth Castle. The ruins stand upon a steep rock, which the owner has leased to the Castle Limestone Quarry Company, of Mostyn. Dyserth Castle, near Rhyl, an ancient British stronghold, was refortified by Henry III. in 1241, and dismantled afterwards by Llewellyn.

Antiquities of Asia Minor.

In view of the present condition of affairs in regard to the antiquities of Asia Minor, referred to in our issue of August 11 (p. 165), we are gratified to receive the information that a memorial to the Ottoman Government will shortly be despatched requesting that steps shall be taken for the protection of these monuments of past ages.

The text of the memorial is as follows:—

"To His Highness the Grand Vizier and Council of Ministers, Sublime Porte Your Highness and Your Excellencies. Without in any way presuming to interfere with the prerogative of Government, we very earnestly beg to appeal to your Highness and the Council of Ministers for the issue, by His Imperial Majesty the Sultan, of an Irade, commanding that measures shall be taken throughout the Ottoman Empire for the protection and preservation of the ancient walls, buildings, temples, fortresses, and other archaeological remains, which are universally recognised as being of the greatest possible value and interest to the artist and architect no less than to the scholar and the historian."

We feel sure that the Government of the Sultan cordially desires to take all possible steps for the adequate safeguarding of these precious monuments of antiquity, and that the Government will not misunderstand our motive in making this appeal. It is because we know the irre-

parable injury done by carelessness to the priceless memorials of the earlier decades of the last eight centuries that we hasten to petition for the effective protection of the works of past ages which, if destroyed, can never be replaced."

Those desiring to support this memorial should send their names to Mr. Arthur Phillips, 9, Northumberland-avenue, Putney, S.W.

Barnard Castle Sewerage.

The Barnard Castle Urban District Council have instructed Mr. Harry W. Taylor, A.M.Inst.C.E. (of Messrs. Taylor & Wallin), of Newcastle-upon-Tyne and Birmingham, to report upon the proposed improvement and extension of the existing sewers in the town, including various road improvements, etc.

BUNGALOW AT RADIPOLE, NEAR WEYMOUTH.

This bungalow, for Mr. Charles Raxworthy, R.N., is to be erected on the top of the hill at Radipole, on the west side of the Dorchester-road, and the site commands one of the finest views in the South of England, looking over Weymouth to Portland and the roadstead. The materials will be tiles for the roof, and red brick and rough-cast for the walls.

The architect is Mr. Vernon Hodge.

COMPETITION NEWS.

Stockport Police Courts.

Professor Reilly, the assessor appointed in the recent limited competition for police-station and courts at Stockport has now made his award, which is as follows:—

Selected design, No. 17.—Messrs. J. Theo. Halliday & Claude Paterson, of Manchester and Stockport.

First Premium (100*l.*), No. 11.—Messrs. Appleyard & Quiggin, of Liverpool.

Second Premium (50*l.*)—Messrs. Stoll & Sons, of Manchester and Stockport.

The following are the terms of the assessor's award:

"I have carefully considered the eighteen designs submitted by selected architects in answer to your invitation to compete for a scheme of police-courts and other police accommodation on a site in Wellington-street.

I have pleasure in congratulating you on the excellent results of your invitation. A large number of very capable designs have been sent in which, together with the complexity of the problem, has made the task of assessing no easy matter. I have, however, no hesitation in placing first the design numbered 17. I am of the opinion that, with due care, this design can be erected for the money available. I award the first premium of 100*l.* to the design numbered 11, and the second premium of 50*l.* to the design numbered 12."

The cost of the proposed buildings is 25,000*l.* The designs have been on view in the town hall during the present week.

Technical Institute, Cardiff.

Questions relating to this competition must be sent to the Director of Education, City Hall, Cardiff, before September 15, and the last day for receiving designs is November 30. Mr. J. S. Gibson, F.R.I.B.A., is the assessor. The cost of the buildings, including heating and ventilation, electric light wiring, gas and water supplies, is not to exceed 36,000*l.* Fittings or equipment and boundary walls or railings are not to be included in the estimates. The author of the design placed first will be employed as architect to carry out the work unless in the opinion of the Committee, after consultation with the assessor, there is some valid objection to his employment. The author of the design placed second will be paid a premium of 125*l.*, and there will be third and fourth premiums of 75*l.* and 50*l.* respectively.

East Sussex Hospital, Hastings.

The assessor in this competition, open to all architects in the United Kingdom, will be Mr. Edwin T. Hall, F.R.I.B.A. The maximum cost of the building is placed at 35,000*l.*, and designs must be sent in by November 30. Any questions should be submitted by September 15. The author of the design placed first will receive 125*l.*, and sums of 75*l.* and 50*l.* will be awarded to the architects of the two next best schemes.

Designs for Government Palace and for Town Improvements, Uruguay.

With reference to the notice on pp. 612-3 of the *Board of Trade Journal* of June 22 relative to a scheme for town improvements and a new Government palace at Montevideo, H.M. Minister at that place now

reports that competitive designs are invited by the "Ministerio de Obras Públicas," Montevideo, up to January 30 and 29, 1912, respectively, for the Government Palace and town improvements. Prizes of 10,000 and 4,000 pesos (about 2,125*l.* and 850*l.*) are offered for the best plans for the Government Palace and prizes of 5,000, 3,000, and 2,000 pesos (about 1,060*l.*, 640*l.*, and 425*l.*) in respect of the town improvement plans. A statement of the conditions of the competition (in Spanish) may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 75, Basinghall-street, London, E.C.

BOOKS.

The Corrosion of Iron and Steel. By J. NEWTON FRENCH, Ph.D., D.Sc., F.C.S. (London: Longmans, Green, & Co. 1911. Pp. 300. 6s. net.)

WITHIN recent years much attention has been directed to the effect of the numerous factors connected with the corrosion of iron and steel, and since wrought-iron has been almost entirely superseded by mild steel, the smaller resistance of that material to corrosive influences has been made the subject of careful investigation. The object of the author in writing this work was the collection and presentation in convenient form of all reliable material bearing on the corrosion of iron and steel in order that makers and users alike may have a record of what is already known of the subject, and the directions in which further research is desirable. The task of collecting data scattered through some hundreds of papers and articles has obviously involved much labour, and the result is one which we are sure will be widely appreciated.

Of the five theories of corrosion advanced from time to time, only two, the acid and electrolytic theories, are considered, as the others have already been proved inadequate. The author shows that the most recent experimental results are entirely in favour of the acid theory, and while rejecting the electrolytic theory he points out that the electrolytic theory of ionisation—or the ionic theory as he prefers to call it—is not to be excluded. The effects of various substances and agencies in promoting and retarding corrosion are fully discussed, and the work concludes with a chapter on the relative rate of corrosion of iron and steel. Perhaps some of our

readers may be interested to know that the author is contemplating the issue of a companion volume dealing with the protection of the same metals, this being a subject of great practical interest to architects and engineers alike. The present volume, however, is one of which we cannot speak too highly.

Calculation of Columns. By THEODORE NIELSEN. (London: E. & F. N. Spon, Ltd. 1911. Pp. 36.)

This treatise appears to have been written chiefly with the object of expounding the results of the investigations made by Professor Ostenfeld, of Copenhagen, and to show how these may be applied to the calculation of steel and other columns. As our readers are aware, there are already numerous column theories and formulae, most architects and engineers having their own favourite variety in general use. The methods given in this book are certainly simple; they can be readily used for columns under various working conditions, and, so far as we have examined them, they appear to be safe and reliable. Some interesting diagrams at the end show the relative agreement of the author's and other formulae with groups of test results, the last of the series furnishing a comparison of generally-used formulae. While of decided interest as a study of column design, the practical convenience of the book is somewhat diminished by the adoption of metric units throughout.

A Glossary of Building Construction. By CHAS. H. GREGORY. (London: J. Haslam & Co. 3s. 6d. net. Pp. 136; 22 illustrations.)

This is a short glossary of terms used in building work arranged on a somewhat novel principle, the trades being considered independently, and the more important terms arranged alphabetically under each heading and briefly explained.

The author describes the book as a short introduction to the science of building construction, but it will probably be found more useful as a commentary on the existing textbooks than as a self-contained primer of construction. The information given appears to have been carefully considered, and is set out in a clear and straightforward way, many of the definitions being explained by drawings, which, by the way, might have been greatly reduced in size to permit the inclusion of a larger number of terms. In the sections on calculations and the design of small buildings we are inclined to think that the author has trespassed beyond his sphere; these are subjects of a much more advanced character than the rest of the book, while the information given on design is too meagre to be of any really practical value.

Building Superintendence. By EDWARD NICHOLS. (Chicago: American School of Correspondence. London Agents: Crosby Lockwood & Son. 6s. net. Pp. 200; 260 illustrations.)

The building methods of the United States differ in so many respects from our own that we question whether this new book on supervision, although containing many useful hints, will be found of any great value to the British architect or clerk of works, and some of the points made, might prove misleading to students. Nevertheless, the book is vigorous in tone, and suggests a degree of method in supervision which would prevent many oversights and delays.

Modern Brickmaking. By ALFRED B. SEARLE. (London: Scott, Greenwood, & Son. 12s. 6d. net. Pp. 430; 260 illustrations.)

It frequently happens that able writers on technical subjects cannot speak with the authority of long practical experience, while those who have the practical knowledge have not the power of expressing it in books. We are grateful to Mr. Searle for giving us the benefit of his wide experience in this brick industry in a well-written and interesting volume. *Modern Brickmaking* will be of great service to those directly interested in the trade, and the engineer and architect will gain much by a perusal of its pages. Although no one book on so large a subject could be called exhaustive, the author has contrived to give a great deal of valuable information on each branch of the industry;

the descriptions of the many types of machines used in each process, accompanied by hints as to their relative merits for differing conditions, will save manufacturers from many a mistake in laying down new plants, and the chapters on kilns and firing will prove not less valuable. The book is admirably illustrated by drawings and photographs.

Sewerage Systems: Their Design and Construction. By HENRY S. WATSON. (London: Crosby Lockwood & Son. 10s. 6d. net. Pp. 300; 148 illustrations and diagrams.)

The simultaneous publication of two works on the town sewerage problem which do not materially overlap in subject matter is an indication of the great amount of attention which is being paid to this vitally-important question. Mr. Kershaw's book noticed above deals principally with the disposal of the sewage after it has reached the works; *Sewerage Systems* reviews the methods of conveyance, and, without presuming to be a complete treatise, is fairly comprehensive in its sphere, intelligible to lay readers or students, and well arranged. The subject is treated in five sections—the general design, the preparation of a scheme, the process of construction, maintenance, and legal considerations, with an outline specification, draft regulations, and various forms of notice in appendix form.

Modern Methods of Sewage Purification. By G. BERRILL KERSHAW. (London: Charles Griffin & Co. Ltd. 21s. net. Pp. 356; 36 plates, 12 text illustrations.)

This is a welcome addition to the already large library of books dealing with a problem which is every year demanding more attention and presenting greater difficulties. Mr. Kershaw brings to the work an exceptionally wide experience, and has consolidated a large stock of information in a very readable form. There are chapters on all the more important aspects of a very wide subject, and the various systems of treatment and their adaptability to particular conditions are discussed in considerable detail. The disposal of sludge, the land treatment of sewage, the construction of contact beds, the many considerations affecting the success of percolating filters, and so on, are all dealt with from an eminently practical standpoint, and to all who are interested in the management of sewage works the chapters on these and other subjects should be of great interest and assistance.

How to Manage a Suction Gas Producer. By W. A. FOCKEY. (London: Percival Marshall & Co. Pp. 90. 1s. net.)

WRITTEN as a practical handbook for engineers and attendants, this little book gives very explicit directions for the management of suction gas-producing plant. Every part of the apparatus is described and illustrated by sectional drawings. The matter is arranged under convenient headings and sub-headings to facilitate reference, and we have confidence in recommending the guide to those who have the care of suction gas plant, or who wish to make themselves familiar with its construction and arrangement.

A Treatise upon the Law of Light, including an Exposition of the Law Relating to the Nature, Acquisition, Preservation, and Extinction of the Easement or Right to Light and the Remedies Afforded for the Protection of Window Lights. By R. G. NICHOLSON COOMBE, M.A., LL.M., Barrister-at-Law. (London: Butterworth & Co. 1911.)

The author of this new work on the law of light in his Preface almost apologises for dealing with a subject relating to an easement, seeing the excellence of the existing text-books dealing with easements in general, but he explains that the law of light has always stood, as it were, apart, and that the application of the Prescription Act, 1832, has added to its isolation. As far as we can see, no apology is required for the text-book that he has produced on this branch of the law, which seems written with care and very lucidly expressed. As the author observes, the effects of the decision of the House of Lords in *Colls v. Home and Colonial Stores*, although that case was decided some seven years ago, are so far-reaching that it is possible that even yet they are not fully

appreciated, and for this reason, if for no other, it appears that the opportunity is very favourable for the production of an exhaustive text-book like that now before us.

The author throughout his treatise has adopted two expressions which we agree in thinking both accurate and convenient. The accessory right to light he terms "light easement," and an obstruction which amounts to an actionable interference with the light he terms "light nuisance," the latter term no doubt being suggested by the findings in *Colls's* case.

The volume is presented to the reader in a very attractive form; the type is clear and so varied as to readily mark the sub-division of the paragraphs and to attract the attention, and there are side-notes and footnotes, the titles of the cases referred to in the text being printed in the latter. There are tables of statutes and cases, the table of cases containing also references to the reports in which the cases are to be found. There is also a copious index, but in one instance we have found it defective, as it is difficult to find the reference to an extraordinary or special user of light, although this subject is dealt with fully in the text in Chapter II., sect. 4. The whole work appears to us to be an unusually clear, interesting, and exhaustive exposition of a very complicated branch of the law.

Public Health Law: Being a Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other Officers and Members of Local Authorities. By SIDNEY G. TURNER, Barrister-at-Law, Associate Member of the Institution of Civil Engineers, Graduate of the Institution of Municipal and County Engineers, etc. (London: St. Bride's Press, Ltd. 1911. Pp. 216. 10s. 6d. net.)

ON his title page the author has particularised the class of readers which he desires to reach, but as the title of the book itself is somewhat general we may say that it is divided into twenty chapters, each dealing with a special subject, such as drains and sewers, sewers and sewage disposal, rivers' pollution, nuisances, new streets, housing, etc. There is also a chapter on highways, although the author points out that this, amongst one or two other subjects, is not strictly included under public health. The volume does not deal with the law peculiar to the Metropolis, except in so far as cases decided under Metropolitan Acts have any bearing on the subjects dealt with. There is a table of statutes, a table of cases, with full references to the reports, and an index. The text is clearly expressed and presented in an attractive form, and, so far as we have been able to see, the law is stated with accuracy. In so small a volume it is a pity that the addenda and corrigenda should have to run to nearly two pages, and in this table correction is made more irksome by a departure from the numerical order of the reference to the pages.

The Holidays: Where to Stay and What to See. (London: Walter Hill, Southampton-row, W.C. Price 1s.)

THIS is the sixteenth edition of a work which consists of a collection of lists of seaside, farmhouse, and country lodgings, hotels, and boarding-houses, etc., in the districts served by the Midland, London and North-Western, Great Northern, Great Eastern, Great Western, and Great Central Railway Companies, together with information for tourists, and holiday-makers. It is a useful work for all who may be considering the question of where to stay for the holidays, and it contains, besides much information of use to tourists and others, some good photographic illustrations and maps.

The London Citizen's Year-Book, 1911-12. (London: G. Allen & Co., Ltd. 6d. and 1s. net. Crown 6v.)

THIS is a handy and useful little work, containing particulars of London's local authorities, expenditure, and other information on London questions. The aim of the book is to describe the work of London government, its machinery, cost and problems of local administration and taxation, and all references to the pages of the year-book which we have made justify us in stating that the aim has been amply fulfilled.

EDITORIAL SUMMARY.

"Concerning Bruges" is the title of our leading article, which is illustrated.

Notes (p. 209) include: "Strikes and Electric Lighting"; "A Lesson of the Strike"; "New Method of 'Building'"; "Hygiene of the Eye."

The third illustrated article of our series on "The Story of the Bridge" is given on p. 210. Other illustrations in connexion with the article are given in one of our plates.

The annual excursion of the Architectural Association has been held this year in France, in the district of old Touraine. An illustrated description of the excursion is commenced this week, p. 212.

Book notices (p. 216) include: "Sewerage Systems"; "Sewage Purification"; "Brick-making"; "Building Construction"; "Building Superintendence"; "Corrosion of Iron and Steel"; "Calculation of Columns"; "The Law of Light"; "Public Health Law," etc.

Some notices of the August Magazines appear on this page.

The Monthly Review of Engineering (p. 219) contains: "The Pennsylvania Railway Station" (with illustrations); "Buildings for Explosives Works"; "Some Studies of Welds" (illustrated); and Notes.

The Building Trade Section (p. 224) includes: "Stucco"; "Legal Questions about Extras"; "Government Contracts"; "Projected New Buildings in the Provinces"; "General Building News," etc.

"Quantity Surveyors in South Africa" is the title of an article on p. 227.

Some notes on a new metal filament lamp are given on p. 229.

In Law Reports (p. 232) the case of "Contractors' Action against Building Owner" is continued.

MAGAZINES AND REVIEWS.

The *Art Journal*, with number of pages increased and with price reduced to 1s., seems to be giving more attention than before to non-pictorial subjects, a policy which should extend its influence. Part 2 of an article on Holkham, in a series on "Interiors of English Mansions," includes some well-selected details and a fine view of the Great Hall, remarkable for its lofty magnificence and its fluted columns enriched with variegated alabaster. William Kent's original design for the front of Holkham is an illustration of great interest. The statuary in this famous mansion is described; it forms an integral part of the scheme for decoration, the sculpture gallery particularly being planned for the reception of the works collected by Thomas Coke, first Earl of Leicester. The "Kent" furniture at Devonshire House is the subject of another article, and altogether this number is a tribute to the versatility of the architect, painter, decorator, garden designer, and general artistic referee who flourished under the wing of Lord Burlington. That Kent was too miscellaneous to be continually inspired must be the thought of all those who study his work. Of his talent, however, there can be no doubt. The lacquer screen, reproduced in colours, is a gorgeous piece of Oriental design, and among other illustrations may be mentioned pictures by Sir James Guthrie, P.R.S.A. An article by Sir Claude Phillips on "Rubens or Van Dyck?" refers to the stately "Portrait of a Genoa Nobleman" in the Dulwich Gallery.

The *Burlington Magazine*, in its editorial on the Edward VII. Memorial, criticises the decision of the Committee to place the monument at the Piccadilly end of the Broad Walk, and reminds us that "the only excuse for destroying the chief feature of the Green Park was that by so doing a vista was obtained of the Victoria Memorial from

Piccadilly. The proposal to place the King Edward Memorial in this walk destroys the vista and the excuse for the walk itself." The method of selecting the sculptor is very severely condemned. "We have already expressed our opinion that the arbitrary selection of an artist by a committee of gentlemen, who, however distinguished in other capacities, have no special qualifications for such a duty, will be an injurious blow to the interest and welfare of British art. We maintain that, in spite of the Royal Academy and other stumbling-blocks to progress, there exists in this country a sufficient number of artists who are fitted and entitled to show their mettle, and compete in the case of any national commission for a work of art. We have also stated that the choice of Mr. Bertram Mackennal, A.R.A., might prove justifiable, even in a national competition. We are compelled to modify this statement in view of the fact that in those commissions which have already been showered upon him by the Government—the new coinage, the Coronation medals, and the new postage-stamps—Mr. Mackennal has not shown any qualities as an artist which would justify him for exclusive selection as an exponent of XXth-century British art." An illustrated article on "Hispano-Arabic Art" at Medina Az-zahra refers to recent excavations. Comparisons are made between various forms of ornamentation, and the specimens are interesting in relation to early Mohammedan art.

The *Studio* gives first place in its pages to a well-illustrated article on the recent work of Mr. J. W. Waterhouse, R.A. The illustrations of Old Danish carved furniture of the XVIIth century and later periods show the earlier work to be akin to our Jacobean, while in later examples the more vernacular style reasserts itself. Some notes on the water-garden will interest the amateur, and the work, Jaromir Stretti-Zamponi, of which illustrations are given, displays a strong sympathy with the architectural subjects selected, mainly from the picturesque city of Prague. The remarkable ability displayed in the work of Mr. E. L. Laurensen is also worthy of careful attention. Altogether this issue reaches a very high standard.

The *Connoisseur* contains a very interesting article, with numerous illustrations, on German faience stoves, some of those given being of striking merit as architectural compositions. We regret that we cannot congratulate this magazine on the numerous coloured plates it publishes, one in particular, black medallions on a red background, being particularly glaring and unsatisfactory.

Books on Gothic and Renaissance Architecture published during the last few years are dealt with in the *Quarterly Review*. Mr. W. G. Waters, in his article, does not note any special facts to be disproved, though he thinks Professor Blomfield is mistaken in his view that when Wren went to Paris in 1653 the Louvre was being built by Bernini—"the plan accepted was that of Charles Perrault." The concluding paragraph is pessimistic:—

"In old times, when the triumphs of the builders' art were raised, men desired beautiful houses for habitation and stately banes for prayer; but in this age of rush and luxury they yearn chiefly after hotels and restaurants of Sardanapalian splendour, and motors, still more elaborate, to whirl them from one scene of revelry to another. It is upon work of this sort that the ingenuity of the constructor of to-day is chiefly engaged, and if the results of his labour fail to rival those of the master builders of the XIVth century in artistic merit, it will not be because he has spent less money upon them."

The *Century* includes part of an illustrated article on "Motoring in Algeria and Tunis." Biskra impressed the author, and so did the ruins of Timgad, a city which, in his mind, "stands to-day as the most interesting, the most touching and fascinating place in North Africa. Founded in the year 100 in the reign of the Emperor Trajan, Timgad lies now a ruined dream city. The theatre is set against a small hill, and over 3,000 people could be seated at the play. At the extreme end of two intersecting avenues stands Trajan's Arch."

In the *Revue Générale*, M. Arnold Goffin deals with the influences now governing the direction of decorative art. M. Goffin's wide knowledge of the history of decorative

painting renders his views on the more modern developments worthy of especial attention, and he deals with his subject in a broad and sympathetic spirit.

ILLUSTRATIONS.

Pennsylvania Railway Station, New York.

THESE illustrations of an important work by Messrs. McKim, Newell, & White are given in connexion with the first article in our Monthly Engineering Review this week (see next page).

"The Story of the Bridge."

THESE illustrations of Medieval bridges are given in connexion with our third article on "The Story of the Bridge," p. 212.

FIFTY YEARS AGO.

From the *Builder* of August 24, 1861.

The First Trades Union Directory.

CERTAIN short documents, bearing upon the present disputes between the building operatives and their employers, have recently appeared in some of the journals as emanating from the Trades Council. And now, what is this London Trades Council? It is a body that had its germination from those meetings of the various trades delegates of the metropolis which took place at Shaftesbury Hall during the greater part of the builders' strike of 1859. The parties who had there for so long assembled merged themselves, at the time when the strife was ended, into a provisional council or committee, on whom the joint duty was to devolve of furnishing a code of rules whereby any such council was to be guided in future; and also to prepare and have printed as correct and full a list of such trades as were united among themselves—their places of meeting and the names of their secretaries—as was possible; and which at length has been accomplished under the title of "The United Kingdom's First Annual Trades Union Directory." Its publisher is Mr. Thomas Jones, of Great Chapel-street, Soho; and whose name also appears among the seven attached to an address on the 104th page, these parties making their statement at this concluding part of the work, in lieu of the usual preface matter to be found at the commencement of books. It is the "first" thing of the sort which has been consigned to the long-living operations of the printer's skill. From the index we gather that there are 405 cities and towns in which are to be found those now widely-spread and thickly-clustered confederacies of workmen with workmen, of which we have lately heard so much and are likely to hear more.

CORRESPONDENCE.

Parks and Public Conveniences.

SIR,—When a town park is made (as that proposed at Shadwell, for instance) it usually happens that some small part of it is reserved for a building for tools, stables, or public sanitary convenience. As every square foot withdrawn from verdure is to be deprecated, I suggest that the constructive people among your readers could easily design and construct an erection of ordinary brick arches (or iron and cement perhaps) which would supply the needed business space, covered, lighted, and ventilated, but of such a nature that outwardly it might form a picturesque little hill or "cockery," covered with shrubs, evergreens, and creepers. Inwardly useful and outwardly a beautiful feature of the park. It might even have an elevated walk or terrace, where seats give a view over the park. Where the land is flat this feature is specially desirable.

When I see the many clever things done by builders a matter of this kind does not seem to offer any difficulty. But I have never seen it tried. Why not? Many public conveniences might be better thus, less below ground and more attractive above. Surely this method is not more costly?

"THE STORY OF THE BRIDGE."— III.

MONTHLY REVIEW · of · ENGINEERING.

Pennsylvania Railway Station, New York: Main Waiting-Room.

Messrs. McKim, Mead, & White, Architects, New York.

THE PENNSYLVANIA RAILWAY STATION, NEW YORK.

FOR many years past the only railway system directly connected with New York City has been the New York Central Railroad and allied lines.

The Pennsylvania Railroad Company have lately completed a comprehensive project, including the construction of tunnels under the Hudson River and the city of New York, a gigantic underground station in the middle of the city, and tunnels under the East River. A view of the station building shown in one of our plates.

By the execution of these and auxiliary works a direct route has been opened up between the New England States and the West by way of New York City, the new railway station being not only an immense convenience, but also a notable architectural addition to the mercantile capital of the United States.

The most impressive feature of the scheme

is the station in New York, situated between Thirty-First and Thirty-Third streets, and extending lengthwise from Seventh to Tenth avenue, as shown in Fig. 2; the railway lines, about 40 ft. below street level, comprise twenty-one tracks serving eleven platforms. The area devoted to traffic requirements covers some 28 acres, and includes storage space for nearly 400 passenger carriages.

The site of the works was formerly occupied by five large blocks of buildings, its clearance involving the demolition of 500 houses. The work of excavation to the average depth of 50 ft. below street level involved the blasting of about 3,000,000 cubic yds. of rock. Afterwards it was necessary to build retaining walls to the collective length of 7,800 ft., to divert sewers, gas and water mains, and other conduits, and to execute numerous incidental but important works

inseparable from the excavation of so huge a pit in the heart of a great city. As the level of the rails is from 7 ft. to 10 ft. below high-water mark in New York Harbour an elaborate drainage system had to be established over the entire area of the station.

Reference to the plan (see next page) will show that two important streets—Eighth and Ninth avenues—pass over the underground station, these and parts of other streets and avenues being carried on bridges, the total length of which is 4,400 ft., and the corresponding street area 8 acres.

In order to ensure suitable architectural treatment Mr. William R. Mead, of the firm of Messrs. McKim, Mead, & White, was associated with the Board of Engineers appointed by the railway company.

Considered from the structural standpoint, the station building above street level is virtually a monumental bridge over the

Pennsylvania Railway Station, New York: Block Plan of Sub-station.

underground lines with entrances from the streets on all four sides. In the latter respect the building is far more accessible than any structure of the same class in the world.

In dealing with the exterior, the architects aimed at the realisation of two main features—to impart to the building the character of a monumental entrance and gateway to a great metropolis and to make the exterior suggestive of the purpose which the building was intended to serve.

The reader may judge for himself the happy way in which these ideas have been embodied by reference to the exterior view (see plate), which was taken near the intersection of Seventh-avenue and Thirty-Third-street.

The main dimensions of the building are—Length, 784 ft.; width, 430 ft.; average height above street level, 69 ft.; maximum height above street level, 153 ft.

The structural design is that of a steel skeleton building with masonry curtain walls supported by a series of 650 columns extending down to solid rock, the maximum load on any one column being 1,658 tons. The façades, however, are fine examples of classic architecture, bringing to mind the temples of ancient Rome, and yet conveying a distinct impression of the modern purpose served by the building. The exterior is finished in pink Milford granite, an effective structural stone with soft shades which are particularly pleasing to the eye.

An entrance in the middle of the Seventh-avenue façade leads to the main waiting-room by way of an arcade 225 ft. long by 45 ft. wide, with shops on either side and refreshment-rooms near the end.

The main waiting-room, situated on the first floor below street level, is a hall of magnificent dimension, as may be gathered from the photographic view on page 219. The hall measures 227 ft. long by 103 ft. wide by 150 ft. high above floor level. Its proportions may be realised from the statement that the New York City Hall could be placed between its walls, leaving 10 ft. clear space above the flagstaff of that building. The design and general treatment of the interior was suggested by the great halls and basilicas of Rome, where some of the finest examples of large covered areas are to be found. In this hall are situated the ticket offices, parcels-rooms, telegraph and telephone offices, all conveniently arranged to facilitate operations and to save the time of passengers.

At first it was intended to use Italian marble for the columns and wall surfaces, but, owing to the heavy cost of imported stone, a variety of artificial stone, known as "Travertine," was finally adopted for the bulk of the work, the remainder consisting of natural marble. Travertine is composed of white Portland cement with crushed feldspar as aggregate, and is cast in plaster moulds.

It is stated that the cost of the waiting hall was about 250,000*l.*, including all details of the decoration. Adjoining the main hall are waiting-rooms, 100 ft. long by 58 ft. wide for men and women, and at the same floor level is the luggage-room, occupying an area corresponding to that covered by the arcade and refreshment-rooms above. Luggage is received and despatched through a special subway and

conveyed to and from the underground station by motor trucks and lifts. Spacious carriage courts and cab-stands are provided on this floor of the building.

Another large hall, described as the "Concourse," 340 ft. long by 210 ft. wide, is connected with the main waiting-hall by a spacious passage, and provides space for the circulation of passengers bound for the departure platforms. In addition to the entrance mentioned the concourse is accessible from the streets by stairways. This hall is covered by arched roofs of steel and glass, as illustrated in our plate, and from it lead numerous stairways to the platforms. The design of the roof is somewhat similar to that of the new railway-stations at Frankfurt and Dresden.

On the floor below is a second concourse intended for passengers arriving by trains, and connected with the platforms by two stairways and one lift for each platform, while ample provision is made for egress to the streets by means of stairways and sloping passages.

Independent accommodation is provided for the traffic of the Long Island Railroad, the side of the station along Thirty-Third-street being devoted to this purpose, with ample spaces for the circulation of passengers, and separate entrances and exits from and to the street.

The steel framework of the building represents the total weight of 27,000 tons, the quantity of granite used for structural and ornamental purposes is 550,000 cubic ft., in addition to nearly 1,000,000 cubic ft. of concrete and 15 million bricks.

In an article such as the present it would be impossible to enter into structural details of this great building, which, in addition to its admirable design from the standpoint of public convenience and efficient railway management, is an architectural monument of which New York may well be proud. We are indebted to Messrs. McKim, Mead, & White for the photographs reproduced as illustrations.

BUILDINGS FOR EXPLOSIVES WORKS.

THE arrangement of the manufacture and storage buildings in works for explosives calls for the services of those who have had special experience in the preventing of accidents therein, and who also are aware of the nature

of the various present-day explosive substances. The late Oscar Guttmann, F.I.C., possessed such qualifications, and one of the last things he did, before his lamented death in August last, was to place on record the results of many years' observation of the requirements in question. Resident for many years in England, his experience was very extensive, at home and on the Continent, and it was whilst he was acting as a juror at the Brussels Exhibition that he met with sudden death in a motor-car collision.

His views were primarily embodied in a paper read before the Society of Chemical Industry in July, 1908, and in a patent, No. 4,094, of February 19, 1909. The gist of his proposals was that the roof of the building was to be constructed with sheets or plates of expanded metal, coiled wirework, etc., arranged above or below it, or both, such covering being capable of resisting the impact of falling bodies or projectiles. The metallic covering to be connected with the earth at intervals so as to protect the building against lightning. As to the mode of transmission of the effect of the explosion, by the air and by the earth, and other important considerations discussed by Mr. Guttmann and other experts regarding explosives, this paper may be consulted with advantage.

The results of his most recent experience were set forth in the *Journal of the Society of Chemical Industry* for August 15, 1910, concluding with the following noteworthy announcement. "In order to establish beyond question my priority as regards this idea, I considered it desirable to take out a patent for it in this country. As already stated in 1908, I deem it, however, to be my duty not only to publish proposals of this kind, which are of the greatest importance for the safety of explosive factories, but also to permit everybody to make use of them, free of all licence fees, which permission I formally give herewith."

In the history of the construction of buildings for the manufacture of explosives, two distinct periods are known. The first, during which gunpowder was made in dwelling-houses or outhouses, and the other, during which it was considered advisable to house explosive workshops in very light wooden structures, so that no heavy blocks of masonry could fly about and endanger houses and persons in the vicinity.

This latter principle is expressed in the Explosives Act of 1875, which was due to the efforts of the late Sir Vivian Majendie, and it was thereupon adopted by many other countries.

To attain this object, in France buildings are made with strong walls on three sides,

Section of Protected Building.

tilt the fourth consists of glass. In Great Britain and Austria and Hungary wooden buildings, originally with light, felt-covered roofs, and later on, chiefly in the case of gazettes, with corrugated iron sides and roofs, were preferred. In Germany the buildings were still of light wooden construction, but the roof is sometimes put on quite loosely, being held by two or four wooden pins only, that in case of an explosion the roof is simply lifted off, and the sides are supposed to remain intact, which never happened, except in black powder houses containing very small charges. In this country mounds need only exist on those sides which are within a specified distance from a building not so protected, and then they need only reach to the eaves of the building. In most other countries, the mounds must be at least 1 yd. higher than the highest point of the roof, and must surround the building on all sides, even the eaves to the building being formed by means of a tunnel.

It is the rule to maintain a definite distance between each building in order to minimise damage. This distance is regulated by the quantity of explosive contained in the building, but for practical purposes varies very little, 50 yds. to 52 yds. being the average for mounded buildings of high explosive works (except cartridge huts).

Mr. O. Guttman's method is to construct the buildings of reinforced concrete made with aggregate of fine river gravel. In order to prevent the roof being penetrated by flying debris, it consists of two layers of armoured concrete with a layer of sand between them. Similarly, armoured concrete is used for the surrounding mounds and for the passages leading through them to the buildings.

In a German powder-factory a trial building in accordance with these particulars was constructed, in order to prevent the transmission of fire from one portion of a packing-room to another, and the experiments made this building were a complete success. This proved that for buildings exposed merely to the risks the above outline of construction was sufficient; but, where there is risk of explosion, Mr. Guttman finally adopted a modified form of roof.

The considerations leading to this modification were that the cohesion of armoured concrete might be so great that pieces of appreciable weight might be thrown about, and that the possibility of sand becoming admixed with explosive material in the event of an explosion is not desirable. Accordingly, in planning 1908 and 1909 new buildings for a German factory, Mr. Guttman discussed the subject with Privy Councillor Mente, of the Prussian Ministry of Commerce.

The walls only of the buildings were to be ordinary concrete with river gravel aggregate, this being sufficient to protect them from flying pieces of debris and from the shock due to an explosion some distance away. The roof, on the other hand, in place of armoured concrete, was to be made of light, strong, wooden principals covered over with expanded metal, wire netting, or similar

material. This network was to be provided both on the outer and inner sides of the main rafters, and since protection against lightning was thereby afforded at the same time, the network was connected at intervals to a metal conductor going all round the building and earthed in the usual way.

To test its efficacy as a protection against flying debris, two wooden rafters were covered over on both sides with expanded metal. The meshes were 20 mm. = 0.8 in by 50 mm. = 2 in., while the section of the metal was 3 mm. wide by 5 mm. high. A block of lead weighing 80 lb. was then dropped on to the centre of the expanded metal covering from a height of nearly 70 ft.

The rafters fully withstood the blow and only one mesh of the expanded metal was broken, the effect of the blow having been equally distributed over the whole surface, which had acted like a spring mattress.

A roof of this kind requires to be rendered rainproof by means of a galvanised or tarred sheet-iron cover and electrical connexion made between all metal parts and the wire netting. In the case of buildings where there are no heavy pieces of machinery or long lengths of shafting, the outer covering of netting was deemed sufficient as a security against lightning. The cost of a double layer is, however, of small moment if its provision offers security against inductive effects.

A building thus results which partakes of the nature of a Faraday cage, and which, while very cheap in the first cost, is proof both against lightning and against flying debris and at the same time machinery, shafting, etc., may be firmly fixed therein.

The floor of such buildings has been built by Mr. Guttman over a pit in the ground, and Mr. S. Soddy has observed that earth shocks may be minimised by a similar method.

In the accompanying illustration, which represents Mr. Guttman's design, the floor is carried above the ground a sufficient height to provide openings in the wall bases, thereby allowing air to pass freely.

In this way the layer of air no longer acts to transmit earth tremors to the building (generated by an explosion in the vicinity), but allows the concussion to be dissipated to the outer air. These openings may be spaced so as to facilitate the laying of pipes or other ducts underneath, rather than through the building. They should be provided with detachable wire screens to keep out rubbish, and to give easy access for cleaning, etc.

The roof principals are simply made of boarding, and not rigidly held as to outward movement. The earthen plates and their electrical connexions to the roof network are shown, and also the metallic reinforcement in the surrounding concrete mounds.

SOME STUDIES OF WELDS.

UNDER this title, Messrs. E. F. Law, W. H. Merrett, and W. Pollard Digby read an interesting paper to the Iron and Steel Institute. The meaning of the term weld adopted by the authors is one covering an

actual fusion together of similar or allied metals in addition to mere intimacy of contact. They urge that without such fusion there can be no weld in the real sense, and also insist that in addition to the customary tensile tests of welded joints other comparisons are necessary, such as the nature of the fracture and alterations in the character and composition of the metals due to the drastic thermal treatment, which, though not itself, may cause increased liability to corrosion. The varieties of welds discussed in the paper include electric resistance welds, hot-flame welds with acetylene and water-gas, thermit welds, and steam-pipe flange welds by coke fire and the electric arc. The experiments described are illustrated by seventeen plates reproducing photomicrographic figures, making clear the characteristics of numerous welds examined, each having its own distinctive hall-mark. The paper shows that in every method of welding there is always a more or less clearly defined area of altered molecular construction. Just as quenching and annealing alter steel, so the local heating required for a satisfactory weld leaves its impress on the metal. Electric resistance and acetylene welds seem to be the least prone to oxidation, but good working while the metal is still plastic is of supreme importance where these types are adopted. Electric arc welds are described as most prone to oxidation, and should be employed only for positions where corrosion is not likely to occur; on the other hand, the excellent fusion obtained is a commendable feature of these welds. Flame welds, apart from work such as patching up castings, should receive adequate working while the metal is hot, and of the two methods investigated by the authors it should be noted that water-gas welds may be abnormal through the use of oxidising flames, while acetylene welds certainly require annealing to break down the crystalline structure in the vicinity of the weld. The main difficulties to be overcome in welding are too low a temperature to secure true fusion, and oxidation at the point of welding. Of these, the former is more readily detected than the latter, which is distinctly insidious in its effects, but can be obviated in all methods of welding save that conducted by the electric arc.

ENGINEERING NOTES.

WE have heard a good deal about paper bags lately in connection with culinary practice, but a more recent novelty

is the use of paper-lined bags by a leading firm of cement manufacturers in Sydney, New South Wales. The expedient was due to the objection of dock labourers in the port to handle cement packed in ordinary bags on the ground that the dust emitted causes injury to health, the consequence being that cement in bags cannot be shipped in large quantities. As thousands of bags of cement

are exported monthly to Australian States by the largest manufacturers in Sydney, and the employment of barrels would be inconvenient and costly, the firm have introduced paper-lined bags experimentally. The cost of these is almost prohibitive at present, but it is believed that they can be made very cheaply in large quantities by the aid of machinery.

A Bowstring Concrete Bridge.

The accompanying illustration represents a reinforced concrete bridge of 73 ft. span, recently built in Ohio. The design is one largely adopted in structural steel practice, but is unusual although not unknown in reinforced concrete work. Two reinforced concrete arch ribs carry

Bowstring Concrete Bridge.

the bridge decking by means of suspension members of the same material, and the arch thrust is taken by steel bars passing through the deck slab, leaving only the vertical load to be supported by the abutments. The roadway is 31 ft. wide and a 2 ft. 9½ in. footwalk projects in cantilever on each side. The cost of the work is stated at 1,720L., as compared with 2,200L., the lowest price submitted for a steel bridge of the same type.

Water Outlets for Fire-resisting Buildings.

much injury is caused by the flow of water into floors below that where an outbreak has taken place, lift wells and other openings forming ready means of communication between

Water Outlets for Fire-resisting Buildings.

all the stories. In other cases damage caused by the retention of water on fire-resisting floors where perishable goods stored. There is no difficulty in guarding against both of these contributory causes. All floor openings can be protected by watertight curbs a few inches high, and outlets can be inserted in the exterior walls for the escape of water. We give on this page two drawings of the water outlets provided in a New York silk warehouse for draining away water which will be used in the event of fire. It will be seen that the outer end is closed by an automatically operating door, preventing the ingress of cold air in winter, but which could easily be opened for ventilation purposes in summer if required. The idea is one that will doubtless be welcomed by many architects.

AFTER much discussion of the reconstruction of Quebec Bridge, the preparation of numerous designs by the Board of Engineers and competing firms the contract for the reconstruction of Quebec Bridge has been awarded to the St. Lawrence Bridge Company of Montreal. This company has submitted seven different plans with tenders, also tendered upon six alternative sets of drawings prepared by the Board. Three of the firms submitted sixteen tenders between them making a total of twenty-nine tenders, of which one only could be successful. The large amount of money sunk in the gratuitous preparation of schemes brings into relief an obvious disadvantage of the existing basis of engineering competitions, the aggregate outlay representing no inconsiderable proportion of the cost

Quebec Bridge.
(From the Engineer.)

which is nearly $1\frac{1}{2}$ millions sterling. We reduce a general elevation of the accepted plan, which provides for two railway tracks a footpath 7 ft. wide. The length of the span will be 1,800 ft., the same as that of original span, and the clear headway of ft. will be provided above high-water level. Work is to be completed by December 31, 1911.

A twin tunnel with the length of about 1,400 ft., and comprising two tubes of 20 ft. diameter, is at present nearing completion under the River Elbe, at Hamburg. The works were commenced in 1906, and the total cost will exceed a million sterling. One end of the tunnel is in the suburb of St. Pauli and the other in the city. The highway route between the two places will be reduced by about two and a half miles after the subway has been opened to traffic. Each entrance is approached by way of an imposing building covered with green copper-sheathed dome, and containing lifts for vehicles and pedestrians. Attendance is reduced to a minimum by the application of automatic devices for starting, accelerating, retarding speed, and stopping the lifts.

For some time past makers of sheet steel in the United States have been devoting serious attention to the production of steel less liable to corrosion than the material commonly obtainable, and which experience has shown to be far less durable than good wrought iron. One of the firms producing corrosion-resisting steel is the Inland Steel Company, Chicago, by whom "non-corrosive" sheets are supplied suitable for constructing roofs, tanks, culverts, and for all purposes which ordinary iron and steel sheets are used. The metal is stated to be of very high quality and free from the constituents usually responsible for the ready corrosion of ordinary mild steel. The sheets are supplied in annealed, annealed and galvanized, and in plain or corrugated. Architects and engineers in Great Britain would welcome a material of similar quality.

An ingenious method of constructing a reinforced concrete pumping well at Haddonfield, New Jersey, consisted in sinking a cylindrical wall by excavating the earth and lining up the wall as the work progressed until required depth had been reached, when the bottom of the cylinder was closed by a concave floor.

Fig. 1 is a vertical section, and Fig. 2 a half plan of the well, reproduced from an article by W. D. Vowbury in the *Engineering News-Record*. The well is 42 ft. deep, and has the internal diameter of 20 ft., the thickness of the shell varying from 14 in. at the top to 18 in. at the bottom. The concave floor is 16 in. thick, it is being that best calculated to withstand hard pressure.

The shell is reinforced by a network of vertical and horizontal bars; the vertical bars are arranged in two circles, composed of 1-in. and $\frac{1}{2}$ -in. twisted steel, spaced 48 in. apart in the outer circle and 42 in. apart in the inner circle; and the horizontal bars are arranged in form of concentric hoops, spaced apart at radial distances of from 24 in. to 36 in. The bottom of the well is connected with the shell by a form of tenon joint, and reinforced by a double network of $\frac{1}{2}$ -in. bars forming meshes in square.

The shoe at the bottom was built of $\frac{1}{2}$ -in. plates, and to it were anchored the bars of the outer circle of the shell reinforcement. The moulding of the concrete shell moulds were divided consisting of an outer and inner ring,

divided into six segments and connected by bolts, the height of each ring being 5 ft. 6 in.

Before commencing construction a deposit of soft mud was cleared away from the site of the well. The shoe was then assembled and put in place, and over it were suspended the moulds, the reinforcing bars being temporarily fixed in position. Each 5-ft. course of concrete was continuously deposited, and excavation was carried on while the concrete set. By releasing the moulds the ring of concrete sank down to

the bottom of the excavation, when another ring was moulded on the top, and excavation carried down for a further distance. By continuing these alternate processes the shell was finally completed to the required depth. One day and two nights were usually allowed for the concrete to set and, although no waterproofing material was employed, the well proved to be perfectly dry on completion.

The cost of the well is stated at 1,040l., including roof, ladder, and other auxiliaries.

THE BUILDING TRADE.

STUCCO.

THE most durable stucco is obtained when cement is employed, but the trouble lies in the fact that cement sets quickly, much more quickly than lime, and cracks are liable to appear. If, however, just—with the accent on the word just—sufficient of each ingredient is used, and neither too little nor yet too much water is added, a stucco can be produced that is far superior to any other in weathering powers. If an excess of water is employed the plaster will not cling properly to the wall; yet, on the other hand, if too little be used, the cement plaster will dry so quickly that cracks are certain to result. Again, if too much cement is used cracks are liable to appear. Dryness in any form results in cracks, which in some cases are so fine as not to be discernible except by close inspection. These cracks will in time admit moisture, rain tearing sulphur and ammonia, which will in time break down the protective covering, and the stucco will fall away, either by disintegration or peeling.

One essential, therefore, to good work is that the plaster must not lose its dampness too rapidly, and this can be done by keeping the surface wetted or by way of damp cloths hung in front of the wall. It is also necessary to prevent the water in the cement being absorbed by the brickwork on which it rests, and this can be done by previously well wetting the brickwork.

To make a good weather resistant, the stucco must be dense. This can be obtained by mixing the concrete stiff, and yet contain the necessary water to prevent rapid drying, which will allow the plaster to work rapidly. A very thorough mixing will accomplish this. Trowelling the surface should not be done too much for although by this means density is accomplished, the result will only be the trouble of cracks when dry, which is to be avoided. Trowelling brings the water to the surface, and the work is liable to dry too rapidly.

The proportions of the various materials used is debatable. Whether the first or last coat should contain the most cement has to be considered from two points. The first coat, it is argued by some, should be the one containing the greatest percentage of cement, as it has to bind to the wall and support the outer coats. On the other hand, the last coat is the one attacked by the weather, therefore it should have the greater amount of cement is argued by others. Unfortunately, the greater the percentage of cement there is all the more tendency to crack, and unless great care is exercised a high percentage of cement is likely to produce this undesirable result. A medium percentage is therefore the best in the long run. Thus the coats—three are recommended, as two coat work is little more than $\frac{1}{2}$ in. thick—may be composed of one Portland cement to two of clean, sharp sand. This for the first two coats. The finishing coat may be composed of Portland cement, sand, and clean, sharp shingle. As the cement is liable to expand during wetting and contract, whilst drying the precautions previously mentioned should be taken. Lime stucco is preferred by some, because it is not liable to this trouble.

The sand and shingle must be sharp. Many a failure is due to the non-observance of this. Earthy matter or organic substances not only chemically combine with the cement and break down the stucco, but they prevent the cement from mechanically joining with the sand and shingle.

The first coat should be well scored to form a proper juncture with the second. The wall, too, should be properly prepared, well washed, and joints raked out if necessary. If the wall is old and has been exposed to the weather it should be washed down with a weak acid, as, for instance, muriatic acid. This should be done several days before the stucco is applied.

Uneven thicknesses of plastering should be

avoided or cracks will result through uneven drying. Joints should therefore be filled in before the general coat is applied.

Where firing strips are used for the purpose of affixing metal mesh precautions must be taken to prevent danger from them. This arises from the fact that they are liable to split under the influence of wetting and drying at those places where staples have been driven in to fix the metal mesh, and the mesh becoming loose, the stucco and mesh fall down. By attaching the mesh to the wood strips by galvanised-iron wire tied around both this danger is avoided.

A good lap should be given to the mesh joints, or at these places cracks in the stucco will appear. There is a danger in using metal lath where some patent plasters are used, as some of them contain acid, which attacks the metal. It is desirable, therefore, where such are used to give the mesh a coat of limewash or some similar protective coating.

Where lime is used with cement the limit should be 10 lb. of hydrated lime to one bag of cement, and this should only be used for the second coat. The first and last coats should not contain more than 5 lb. per bag of cement; in fact, it were better to use none at all in the finishing coat. Only hydrated lime should be used, and no plasterer's putty. Hydrated lime is lime scientifically prepared, being properly cleansed and screened, and is free from all impurities. A good substitute for sand used by the Americans is asbestos rock and fibre. The fibre performs the binding function of ox-hair in plastering, the stucco being less liable to crack. The use of asbestos fibre along with cement and sand can be recommended. Other aggregates, such as crushed marble, finely-crushed granite, and similar rocks are used where some special finish is desired.

To obtain a rough-cast finish, mix one part hydrated lime with two of Portland cement, mixed dry, and add water until a thick paste is obtained. Put this into a pail, and, keeping it well mixed, take out by means of a paddle or trowel, which, dashed against a stick held in the other hand, splashes the mixture on to the wall, giving the rough-cast finish.

Pebble dashing is composed of clean-washed pebbles mixed with a thick paste of the composition above. This gives a pebbly surface to the work. To obliterate any streaks showing after the finishing coat has been put on, a lime-cement wash can be used, which at the same time will fill in any cracks. To obtain a float finish, the surface is treated with a hand float in the ordinary way for plastering.

"Depefer" is a rough-cast into which pebbles or broken stones are pressed after the last coat has been floated and whilst it is still wet.

If tinting is to be done the colouring matter can be added to the cement-wash just mentioned, but the result is not so lasting as pigments mixed along with the stucco. Free lime in the concrete when moist chemically combines with many of the ordinary colour pigments, and also attacks any organic matter in the plaster. The use of paint, therefore, containing linseed oil should be avoided. The percentage of colouring matter to be added to the plaster depends upon the tint required. This may be a source of danger, because a high percentage of some pigments weakens the plaster. Yellow ochre can be added up to 8 per cent., and gives a bright tan colour. Yellowish brown or buff can be obtained from 5 per cent. yellow ochre and $\frac{2}{3}$ per cent. of permanganate brown. Black shades are obtained by using a small percentage of lampblack or carbon. For red, red oxide or iron are the only colours that can be safely employed. A strong, highly-priced oxide, whereby a small percentage only is necessary, is better than a weaker, cheaper grade. Black iron oxide will give a bluish shade of black. Brown is a colour not readily obtainable except at the expense of the plaster's strength.

Iron oxide can be used; the lime in concrete acts on ferric chloride or ferrous sulphate, giving a reddish-brown colour deposit of ferric hydroxide; but to obtain this 20 to 30 per cent. by weight of colouring matter is required. Green is not colour difficult to obtain. The only green pigment that will stand the lime action is chromium oxide, which is an expensive mineral pigment. The colouring values of the cheaper grades are very low. By mix blue and yellow green can be produced, the trouble is to obtain a good strong tint that will withstand the lime. A good tint is ultramarine blue, but it has a very poor colouring power when mixed with other pigments. It will, however, stand the action of the lime.

The alternative is to use a light-colour plaster, but this means a more expensive stucco. Olive green can be obtained by using yellow ochre and a pigment of bluish tensity, as some of the blacks, but the brown sandy shade of the concrete has yet to overcome before a good green can be obtained. The alternative is painting the surface.

SOME LEGAL QUESTIONS ABOUT EXTRAS:

THE ARCHITECT AS ARBITRATOR

We have received the following communication from a well-known builder:—

"I am thoroughly in agreement with the remarks of Mr. J. E. Yerbury in your issue as to the necessity for a revised form contract. But whatever care may be taken in framing a revised form, I imagine that the legal profession will, until the end of time, persist in acting on the principle that law and justice are not necessarily synonymous. Lifelong experience in the building trade has brought this hard fact home to me on many occasions. More than once the R.I.B. form has been submitted, in my presence, a barrister who had had no previous knowledge of the document, and after perusing he has asked me, with an air of questioning surprise, "And have you really signed this? Why you are entirely in the hands of the architect." Of course, some will say that speaks volumes for the general integrity of the profession that there are comparatively few cases figuring in the courts. On the other hand, it must not be forgotten that, in bygone days, the number of cases where builders consider they have a real grievance, considerations of expense or other equally cogent reasons may determine them to submit what they deem injustice with what gain they may.

I am inclined to agree that the arbitrator should, by preference, be a lawyer, although the idea seemed a startling one at first. It is no slander to say that the architect, arbitrator in his own case, is in an impossible position if an unbiased, impartial decision is the desideratum. It is against human nature.

I have in my mind an architect for whom I have worked for at least a score of years and with whom I have settled up as many jobs, always in a friendly manner, yet me it is only too obvious when he has client difficult to satisfy, or when his plans or specifications chance to be a little faulty—as must happen sometimes to the nearest painstaking architect. In such circumstances he appears a different man altogether and falls back upon his powers under contract in a manner that, although entirely unconscious to himself, is patent to a student of human nature like myself. I very much doubt whether the strong and just architect alluded to by Mr. Yerbury really exists. Certainly, some of the architects of high reputation in the profession fail to reach ideal in these respects. Quite possibly he is I show my own bias. I am quite certain, however, that men at the top of the profession are not disinclined to shield their own reputation behind the broad back of the building. The maintenance clauses, sometimes enforce the remedying of defects over a period of one or, as in one case I know of, two years and the withholding of the retention mon-

a powerful weapons when the architect has mind to do this. Twelve months bring to light many defects, not all of them due to material or faulty workmanship. I have had to replaster ceilings whose cracks were doubtfully owing to ignoring the formulae laid down as to the proportion the depths of joists and beams should bear to their span; make good settlements undoubtedly caused by skipping the foundations in unsatisfactory manner; to renew casements badly designed for the purpose of keeping out wet; and so on. I have unacknowledged but fully-understood myself for neglecting to do so being the loss the architect's favour and opportunities of ordering for his work. My advice was asked short time ago with reference to a case in which the architect deliberately rejected the plans submitted by the builder, and ordered him to obtain tiles from a certain yard. These went wrong, and after two years, the attention money having been withheld, the builder was ordered to strip the roof and tile with other tiles. To my mind, this architect's notion of fairness is embryonic, his idea of justice elemental. Yet he and the others are all of them, like Brutus, "honourable men." One can only echo Burns's cry, "O wad the Powers the gittie gie us, to see ourselves as others see us." There would be rejection, of course, to the substitution of a lawyer for an architect as arbitrator on a ground of lack of technical knowledge, but I imagine, if lawyers were appointed as regular thing, some of them would soon specialise in this particular direction. I do not understand Mr. Yerbury's assertion in relation to extras, that the builder charges as much as he can. How can this be when the contract specially provides that these are to be measured and valued at contract rates? On the contrary, the standing relevance is that it is impossible to carry out the bulk of the extra works without incurring serious loss. An additional door or window ordered, and, notwithstanding the wall is cut from 25 per cent. to 50 per cent. more than the same articles when made in quantities, the surveyor usually insists upon pricing the contract rate for the larger quantities, and prates about the law of average. Times without number I have had to accept 1s. 6d. for an odd window which the shop-books show to have cost 2s., and so with other things: a little bit of garden wall, or a little bit of a pipe, ordered after the bricklayer or the plasterer have left the job, is supposed to be ordered at the same price as the bulk of the work, although men and tackle have to be brought back to the job on purpose to do these little jobs. Extras of this kind are a curse, and ruin many an otherwise profitable job. The ideal contract under the present system is undoubtedly that in which the plans and details, in a complete state, are handed to the contractor upon signing, and no deviations or extras occur. Architects never give consideration to the fact that variations almost inevitably mean delay, delay means disorganisation, disorganisation means loss. Six months in a builder's office as correspondence clerk would bring this home to them as nothing else could."

GOVERNMENT CONTRACTS.

The following tenders have been accepted during the past month by the Government departments named:—*Admiralty, Works Department:* Granite piers—Messrs. A. & F. Ansell, 57, Gracechurch-street, E.C.; heating of detention quarters, Devonport—Messrs. J. & Beale, Ltd., 1, Arthur-street, East. *Admiralty, Contract Department:* Firelocks—Messrs. Bonnybridge, Silica, & Fireclay Company, Ltd., Bonnybridge, Stirlingshire; Messrs. Candy & Co., Ltd., Heathfield Station, near Newton Abbot; Messrs. Martin Brothers, Ltd., 22, Lockyer-street, Plymouth; Messrs. Westman Collieries, Ltd., Milburn-house, Newcastle-on-Tyne; Messrs. Westlake & Co., Ltd., Cornwall. *War Office:* Works repairs, erection of married soldiers' quarters, Royal Military College, Sandhurst—Messrs. T. R. and G. Kersley, Frogmore, Blackstar, Hants; erection of barrack blocks, Dover—Messrs. G. Lewis & Sons, Widdred-road, Dover; erection of forage barn, etc., Barry, Glam.—Mr. J. Raitt, 9, George-street, Montserrat, N.B.; excavation work at Woolwich dockyard—Messrs. F. & T. Thorne, Isle of Dogs, E.; periodical services, Fermoyn and London (Wellington Barracks)—Mr. F. Holdsworth, 32, Saltair-road, Shipley, Yorks;

Tipperary—Mr. T. Kellcher, 4, Millard-street, Cork; Woolwich—Mr. F. Holdsworth, 32, Saltair-road, Shipley, Yorks; renewing flooring, Aldershot—Mr. Jas. Crockerell, Stanhope Lines, Aldershot; structural steel and iron for coal bunkers, Woolwich—Willes Foundry Company, Ltd., Widnes. *Crown Agents for the Colonies:* Cement—Messrs. Peters Bros., 72, Victoria-street, S.W.; Messrs. Martin Earle & Co., 159, Queen Victoria-street, E.C. *Office of Works:* Builders' work, Blackburn, alterations and additions to County Court—Messrs. W. J. Woolf Cronshaw & Sons, Pump-street, Blackburn; British Museum, reconstruction of roof—Messrs. W. E. Blake, Ltd., Plymouth; Carnforth, new post office—Messrs. R. Thompson & Morris, 12, Dalton-square, Manchester; Crydon, enlargement of telephone exchange—Messrs. J. & M. Patrick, Wandsworth, S.W.; Devonport, extension of post office—Mr. A. N. Coles, Old Town-street, Plymouth; Edinburgh, new workshops at Brighton-street—Messrs. J. Scott & Brown, 3, Barclay-place, Edinburgh; Eltham, new post office—Messrs. Thomas & Edge, Woolwich, S.E.; Glasgow, temporary accommodation at head post office—Messrs. William McCall & Sons, 5, Balmano-street, Glasgow; Hull, adaptation of labour exchange—Mr. P. T. Kettlewell, 60, Trinity-street, Hull; Kidderminster, enlargement of post office—Mr. E. Crowdon, Farm-street, Birmingham; Maybole, new post office—Messrs. D. & J. Milligan, 46, Kyle-street, Ayr; Newcastle-on-Tyne, new branch post office at Heaton—Mr. J. Milne, Coatsworth-road, Gateshead; Romford, new post office—Mr. F. Wilmott, 36, High-road, Ilford; western telephone exchange erection—Messrs. Howell J. Williams, Ltd., 11-17, Bernonville-street, S.E.; Woking, alterations to post office—Mr. McCarthy E. Fitt, 118, Oxford-road, Reading; pavement and vertical lights, British Museum extension—Messrs. Thaddeus Hyatt & Co., 9, Farringdon-road, E.C. *Commissioners of Woods:* Pair of stone cottages at Ford, Inverleiver, Co. Argyll—Mr. J. Carmichael, Kil-michael, Glassary, Lockgilthead, N.B. *Commissioners of Public Works, Ireland:* Erecting and furnishing Malinmore National School—Mr. R. Colhoun, 22, Strand-road, Londonderry.

GENERAL BUILDING NEWS.

NEW FREE CHURCH, FRINTON-ON-SEA.
The plans of this church have been prepared by Mr. W. Hayne, J.P., architect, of Frinton-on-Sea, and the builders are Messrs. Potter & Sons, of Chelmsford. The contract price is 3,332.
NEW SCHOOL, EDINBURGH.
A new higher grade school is to be erected on a site at Viewforth, at a cost of 54,000l., to provide accommodation for 1,200 pupils. The architect for the work is Mr. John A. Cairns, of Queen-street, Edinburgh.
REMODELLED SCHOOL, MACDOFF.
The alterations to this school have been carried out under the direction of Messrs. Sutherland & George, architects, of Aberdeen. The various contractors were:—Mason work—Mr. J. G. Corbett, Fraserburgh; carpenter work—Mr. J. Watt, jun., Inverurie; slater work—Mr. Forbes Morrison, jun., Aberdeen; plaster work—Messrs. Roger & Baxter, Aberdeen; plumber work Mr. J. Connell, Macdoff; painter work—Messrs. Gordon & Watt, Aberdeen; heating—Messrs. J. Blaikie & Sons, Aberdeen; block flooring—The Acme Block Flooring Company, London.

NEW BANK, ASHTON-UNDER-LYNE.
The new buildings of the Ashton Savings Bank have been erected from designs selected in competition—prepared by Messrs. W. H. George & Sons, architects, of Ashton. The cost of the erection was 3,800l., and the builders were Messrs. Saxon Bros., of Stalybridge.
NEW WORKHOUSE INFIRMARY, READING.
These buildings, which were opened last Saturday by Mr. John Burns, have been erected at a cost of 15,732l., from the designs of Mr. W. Roland Howell, F.R.I.B.A., architect, of London and Reading, and the various contractors were:—Messrs. H. W. Godwin & Co., Church-street, Reading; additions to nurses' homes—Mr. McCarthy E. Fitt, Oxford-road, Reading; the committee-room block, the aged and infirm block, and the mortuary, Mr. Francis Newberry, King's-road, Reading; the additions to the porter's lodge and the building of the operating department, The sub-contractors included the Klein Patent Fire-Resisting Syndicate, Ltd., of 135, High Holborn, W.C., who laid the floors and roof of the aged and infirm block and the roof of the operating department; Messrs. Val de Travers, of Bishopsgate-street, E.C., who laid the asphalt on roofs; Messrs. Vulcanite, Ltd.,

of 115, Cannon-street, E.C., who executed portions of the roofs of the nurses' home, committee-room block and porter's lodge; Messrs. Despecker, Ltd., of Holborn Viaduct, E.C., who laid all the Terrazzo flooring; Messrs. Bain & Co., of 22, Cannon-street, E.C., who erected the outside iron staircase; Messrs. A. Brown & Co., of 81, Smallbrook-street, Birmingham, who supplied the door and window fittings; Messrs. Baughan, of London-street, Reading, who installed the electric light in the operating-room block and the bells and telephones in the block for the aged and infirm; Messrs. Dennison, Kett, & Co., of 11, Queen Victoria-street, E.C., who supplied the lift in the same block.

BANK, NEWCASTLE-ON-TYNE.
Considerable extensions and alterations have been made to the Lambton branch, Grey-street, of Lloyds Bank, Ltd. Adjoining premises were obtained, which were rebuilt, the basement and ground floor added to the bank, and the upper floors are offices. The bank is fitted up in mahogany, the floor of public space is vitreous and ceramic mosaic, the behind counter in oak. The floor of managers' and consulting rooms is finished with parquetry. The general contractors were S. F. Davidson & Miller; mosaic by Emley & Sons, Ltd.; fireplaces by Henry Walker & Son, Ltd., and Emley; plastering by Davidson & Miller and John Chapman; electric installation by S. Gillitt; locks and hardware by N. F. Ramsey & Co.; painting and decoration by John G. Cole and Davidson & Miller; heating by The R. J. Ward Company (all of Newcastle); stanchions, columns, and girders by Dorman, Long, & Co., Ltd., Middlesbrough; fireproof floors by The Fawcett Construction Company, Ltd., Greenwich; wood block floors and parquetry by The Art Pavements and Decorations, Ltd., London; sanitary fittings by Doulton & Co., Ltd., London; electric passenger lifts by Weygood & Co., Ltd., London, and Pickering, Ltd., Stockton-on-Tees, and a specially built basement lift by Pickering; electric fittings by Best & Lloyd, Birmingham, and Verity, Ltd., Manchester; entrance doors by The Van Kamel Revolving Door Company, Ltd., London. New fittings, counters, desks, etc., which are in mahogany, were made by Robson & Sons, Ltd., Newcastle. The whole of the work was designed by and carried out under the personal direction of Mr. John W. Dyson, architect, Newcastle, and Mr. C. H. Davies was clerk of works.

DRURY-LANE THEATRE.
Considerable alterations and decorative works are in progress at Drury-Lane Theatre, which reaches its centenary next year. The vestibule is being entirely remodelled in connexion with the reconstruction work. The ceiling has been panelled, and enriched beams added with a modillion cornice to the walls. The walls have been treated with a high dado in polished mahogany, running all round the vestibule, and in place of the old solid doors leading to the rotunda and staircases French doors in mahogany have been put with bevelled plate-glass panels. The existing lobby doors have also been brought into harmony with the new scheme of decoration. The large saloon over the vestibule is also in the hands of the decorators, and considerable additions are being made to it. The main staircase ceilings needing reconstruction, an opportunity has been taken to put in a modelled ceiling with new lantern lights over each staircase. The architects are Messrs. Pilditch.

NEW BUILDINGS IN LONDON.
Rebuilding premises, Poppin's court, E.C.; Messrs. Dove Bros., builders, Islington. Shops, etc., Great Portland-street and Great Castle-street, W.; Mr. W. E. Blake, builder, Montague-place, W.C. Shops, showrooms, etc., Princess-street, W.; Messrs. F. H. Kingler & Sons, builders, Oxford. Rebuilding premises, Oxford-circus, W., for Madame Louise, draper, etc.

HER MAJESTY'S OPERA HOUSE, WINTER GARDENS, BLACKPOOL.
The Opera House and Grand Foyer, Blackpool, has just been opened. No additional land was taken in for the new building, but the available space has been so utilised as to provide seating accommodation for 2,300 people, as compared with 1,500 in the old building. The style adopted is Louis XIV., and the facade is of Marmo, relieved with ornamental railings along the balcony. The main entrance in Church-street may be described as a marble hall, for there is a white marble staircase leading up to the royal circle and foyer; the floor is of black and white marble laid in chess-board fashion, and round the walls there is a dado of Brèche de la Vierge marble. The fibrous plaster work in front of the private boxes and royal circle is taken from a model of an ancient chateau in France. The orchestra stalls consist of inlaid mahogany

SYLVESTER HOUSE,
HACKNEY, N.E.

His town housing scheme has just been completed at Hackney in the centre of a district that has long been deplorably neglected. Improvements were also entered into with the Local Council for widening Eglewell-path throughout its length, whereby a fine new street has been created, and an undesirable removed.

The buildings are planned so that every flat has the sun some time of the day, either the rooms or on the balcony. The main entrance is from Sylvester-road, which is on the centre axis of the scheme; and the buildings consist of four blocks, with a central garden for the use of the tenants. A drying-ground is adjoining, and plenty of space for the children to play in is provided. The balcony system has been selected for the flats on the lines so successfully adopted by the London County Council, whose municipal dwellings are probably the finest in the world.

The flats contain two, three, and four rooms, besides a scullery with rentals from £10 to £12s. a week, according to size and position. Every flat has a good living-room of 13 ft. square, and the scullery is fitted with all the modern conveniences that tenants require. The problem is one of greatest economy of space combined with decency, and this has been obtained wherever possible.

It is seldom that an improvement of this kind is initiated and carried through by the owners, but the experiment has been made by Sir Richard Stapley and his partners, who have always been keenly interested in social matters, and particularly in housing. The architects are Messrs. Warwick & Hall, 15-square, Gray's-inn, W.C., and the surveyors Messrs. F. & H. F. Higgs, of Loughborough Junction, S.E.

QUANTITY SURVEYORS IN
SOUTH AFRICA.

By H. BELL JOHN, F.S.I., A.M.S.E.

DURING the nine years that have elapsed since the completion of the South African War this country has seen many changes in the quantity surveying profession. All or most of these changes have tended not only to the improvement of methods in general, but also to the bringing about of a uniformity that might, in other circumstances, have taken many years longer to effect.

My object in these notes is to trace the rise of quantity surveying in South Africa since the Vereeniging Pact, and to show as clearly as possible its growth to its present, I think I may say, satisfactory position. It can be fairly claimed that the Public Works Department of the Transvaal has influenced this growth to a considerable degree. The work done in any country depends more or less on its needs and on what it is prepared to put up with. It is said that every country boasts a representative form of Government gets the government it deserves. In the same way it gets the architecture, the law, and, in due time, everything else. The tendency in new countries is to put up with things that in older would not be tolerated, and it is natural this should be so in a country like South Africa. The poorly-trained or unapt man is much in evidence. I do not mean by this that most professional men in South Africa are of the poor quality, but that the poor quality man is more likely to get work here than in England—work of responsible nature. The result is not of any benefit to the profession concerned as a whole or to the good men individually.

In such a country as ours there is the "make-a-pile-quickly" ambition pervading all ranks and all callings, and this does not encourage too much conscientiousness in work. If 2½ per cent. can be charged for a bill of quantities for a 2,000l. building, and it can be put on two pages of one's office notepaper, why should a man go to the foolish extreme of using a system and fifteen pages of properly-ruled and written foolscap? The

fact of the two-page bill, including such items as "measure painter from joiner," only helps to leave room for the "allow for 2½ per cent. on above total for bills of quantities." When all is said, the house gets built, and the quantity surveyor (who, in so many cases, is the architect) gets his fees.

It is gratifying to be able to say that that sort of thing has had its day, and decent quantities are now a recognised part of a decent building contract. It is far preferable that no pretence should be made, and that works should be put to tender without quantities than that such makeshifts should be used. Many quite large buildings, public and private, have gone to tender without quantities, but as far as public buildings are concerned the time for such things has passed. The Public Works Department of the Union of South Africa issues quantities for practically all works costing over 500l., and quantities that could be put beside most London bills without suffering from the comparison. The Johannesburg Municipality is busy preparing quantities for its large municipal buildings.

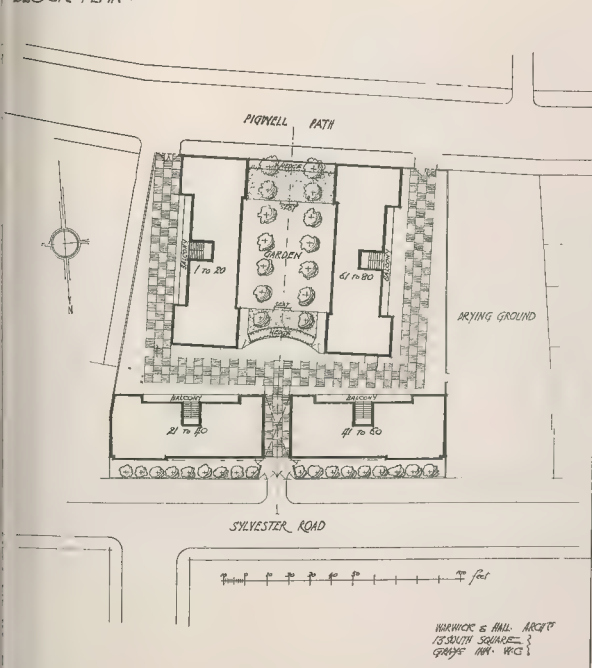

Before the union of the South African Colonies the Transvaal was the only colony with anything approaching an organised branch of quantity surveying in its Public Works Department. During the years since the war several reorganisations of the public service have taken place, but the quantity surveying branch of the Public Works Department has remained either as a distinct branch of the architectural branch, or as distinct from it under the Chief Engineer. Both systems have worked well, and at present with the quantity surveyor as also chief assistant to the architect, with the two branches under his administrative control, the arrangement is as good as it could be. The three assistant architects are, for design, responsible to the architect. There is no mixing up of draughtsmen's work with quantity assistants' work.

In 1902 the Public Works Department of the Transvaal engaged in London two quantity surveyors, an assistant quantity surveyor, and four "workers up." These were added to locally, and the eleven then put into the dough has leavened the whole loaf. To-day quantity surveyors in South Africa have a good and definite standing. Times and men have changed during the past eight years, and men from all over the sub-continent are now employed at Pretoria in the Public Works Department. Outside work has been scarce; departmental work has fortunately been plentiful, at least in the Transvaal, and the fact of all these outside men being temporarily employed under the Government quantity surveyor can bring nothing but good to them and to the profession.

In writing thus of the work done by the Civil Service quantity surveyors I have no intention of slighting the work done by surveyors in private practice—some of them in practice before the Service branch was in existence, and some in practice to day in Cape Town, Johannesburg, Pretoria, and elsewhere.

The two factors that have counted most in the development of the profession, in addition to the importation of trained surveyors by the Transvaal Government, are the Transvaal Society of Quantity Surveyors, founded in 1905, and in 1908 becoming the South African Institute of Quantity Surveyors, and the Federated Master Builders' Associations. The former now has over thirty members, and has consistently urged that quantities should be supplied for all large works. The latter has frequently refused to tender where quantities have not been supplied. The former has done a service by issuing in pamphlet form a guide to a standard system, not, it must be admitted, the final word in systems, but helpful as a starting-point to further developments.

The practice of architecture is, in the Transvaal, a close profession, and it is intended to try to extend the privilege to the Union. In the Bill to effect this it is hoped to obtain some recognition of the quantity surveyor. The only text-book on quantities as practised in South Africa is that by Mr. Cowin, who was at one time in practice at Cape Town. Now that the colonies are merged, it will probably require to be brought up to date subsequent to a standard

HOUSING SCHEME AT HACKNEY:

stem being agreed on between the Institute and the master builders. In conclusion, it is necessary to remind readers that the white population of the Union of South Africa is only about one million and a half, that its territory is over six times the area of Great Britain, and that the undertakers of England cannot apply in quantity, though they may in quality, to this country. The profession is in a promising position. Much has been done, though much remains to do. Forces are at work which cannot be withstood, and it may be reliably opined for the profession here, that it is before it a future of great usefulness, such prosperity, and honour.

A NEW METAL FILAMENT LAMP.

On the 16th inst. the British Thomson-Houston Company, entertaining a company of representatives of the technical and lay Press at Rugby, were their general factory is situated, in order to bring to their attention a new filament which they have discovered and are now offering on the market. Their guests were shown the works and the large factory, particularly in detail, and the process of manufacture, with its organisation into innumerable divisions of labour, was made plain. As is well known, the firm is American in origin, and is still mainly under American control, and the various departments are, for the most part, under gentlemen of that nationality. The site was chosen, and the works begun, by a German firm, displaying a German logic in the choice of a place at once so central and so well served by several railway systems as is Rugby. As now in being, the Company was formed in May, 1896, and when its Rugby factory is completed in 1901 the number of people employed by the undertaking was only 800. In 1906 this number had increased to 2,000, and at the present date the number of hands regularly employed at the works, offices, &c., is over 3,000. The works are now carried on upon some 100 acres of land, whilst the floor space occupied is about 1,000,000 square feet, being at the present time upwards of 500,000 square feet. The Company cover in their operations practically the whole field of electrical engineering and manufacture. They turn out a complete assortment of electric lamps, including the Edison Carbon and Gem types, and Mazda (metal filament type). They design and equip rail and tram lines, build electric locomotives and all types of electric power plant. They are proprietors of the patent rights for the United Kingdom of the General Electric Company of America (the largest electric manufacturing Company in the world), of the Allgemeine Elektricitäts Gesellschaft of Germany, and the French Thomson-Houston Company. The Company have been engaged in the manufacture of electric lamps since 1902, and are among the first to manufacture metal filament lamps in this country. They have been among the foremost in all improvements and developments of electric lamp manufacture, from carbon to metal filament, and have now added a new electric incandescent lamp upon a British market. It is a new development of the well-known "Mazda" lamp and denotes a momentous advance in the making of electric lamps. The lamp is of the metal filament class employing tungsten filaments. But it differs from all the others in the circumstance that it is constructed with a solid-drawn wire of tungsten, instead of the brittle strands of "used" or "squeezed" tungsten employed in other lamps of the metallic filament class. After three years of laboratory work, the Company and their associates have succeeded in rendering tungsten into a ductile form and drawing it into a wire. The better to appreciate the importance of this development it is necessary to understand the conditions which have governed the manufacture of metallic filament lamps hitherto. It is generally known, the filaments are made by pressing through a die a mixture of powdered tungsten and a binder, the latter subsequently removed. The resulting structure, consisting of particles of tungsten fused together, are obviously of an extremely brittle nature, and consequently the tungsten filament lamp has not been able to withstand ordinary rough usage. The risk of breakage is substantially reduced by the introduction of the rigid connections which have hitherto been a feature of tungsten filament lamps. Instead of short lengths, tied to the supports at four or five different points, the filament is formed in one continuous length, wound upon spider supports held clamped flexible connections to the

leading-in wires. The drawn filament is, besides, continuous, and is not subject to the variations noticeable in the ordinary metal filament lamps, where, as is often the case, one section of the filament will burn at higher temperature than the rest, thus reducing the life of the lamp. The enormous advance represented by the production of a drawn wire tungsten filament of accurate uniformity and continuous length is obvious.

A Note on Tungsten.

Tungsten has heretofore been known chiefly as a steel-hardening metal. In recent years, however, it has become an important material for filaments of incandescent lamps, and is to-day the most efficient metal for this purpose, owing to its high melting point (3,000° C.), which is higher than that of any other metal, and its low vapour tension. The metal has ordinarily been obtainable in commerce in the form of a dark grey powder, usually made by the reduction of the yellow oxide by hydrogen or by carbon. Even in ordinary commercial lamps the filaments are of a degree of purity so high that no impurities can be discovered by the most searching methods of chemical analysis known. Not only is this true, but these filaments, during the course of commercial production, are exposed to temperatures high enough to drive out by mere vaporisation almost any impurity. Nevertheless, these filaments show no traces whatever of ductility, or even pliability, but, on the contrary, though strong enough for mounting in commercial lamps, they are exceedingly brittle and incapable of taking a permanent set. Attempts have hitherto been made—but always without success—to produce ductile tungsten by various purification processes, varying the ore from which the tungsten is obtained by trying first wolframite (an iron-manganese tungstate) and then scheelite (the calcium tungstate). Announcement has recently been made, however, of the production of tungsten in a form in which it is ductile. This ductile tungsten would seem to be a new substance from the point of view of the physical chemist. Ductile tungsten is bright, tough, steel-coloured metal, which can be drawn into the finest wire, much below one thousandth of an inch. The tensile strength of the wire increases as the drawing proceeds; or, in other words, the more the metal is mechanically worked the tougher and stronger it gets.

LONDON COUNCILS.

Croydon.—The relation of diphtheria to sanitary defects in houses is examined by Dr. H. M. Richards, the Medical Officer of Health, in his annual report. He says that the proportion of houses infected with diphtheria that were found to have serious defects in their drains was 7.3, a figure which is rather less than those found in the two preceding years. The figure confirms the view that sanitary defects are not an important factor in the causation of diphtheria. Dr. Richards, in another portion of his report, says that the number of systems of combined drainage dealt with as single private drains during the year was fifty. This work was carried out under the provisions of the Croydon Corporation Act, 1905. The cost of carrying out the necessary works amounted to 556l., and was borne by the owners instead of, as elsewhere, by the inhabitants at large. 905 back yards were paved during the twelve months. This was a considerable increase over the number dealt with in the previous year, and is a record of work of considerable sanitary value. Friern Barnet.—The Local Government Board has sanctioned a loan of 2,500l. for improvement works at Friary Park. Application is to be made to the Local Government Board for sanction to borrow 3,600l. to be expended, in addition to 2,000l. received from the Middlesex County Council, in widening the bridge over the Great Northern Railway. The Local Government Board is also to be applied to for sanction to borrow 440l. for a new road from Sydney-road to Alexandra-road. The following plans have been passed:—Six houses, Ashurst-road, for Mr. G. S. Scott; eight houses, Chandos-avenue, for Mr. J. Farrer; four houses, Friern-lane, for Mr. E. K. Wilton; depot for horses and house, for Messrs. Carter, Paterson, & Co. Marylebone.—The Medical Officer of Health, in his annual report, says that the total number of inspections made by the drainage inspectors was 8,325, as against 6,850 in the previous year. The number of plans relating to drainage of new buildings was fifty-two. In the case of old buildings the number of plans received was 570. The total number of plans deposited was 622, as against 521 in the previous twelve months. The number of orders under seal as to combined drainage granted by

the Council was twenty-seven, as against twenty-three the previous year. In fourteen cases the liability of the Council for the reconstruction of the combined portions of existing drains was admitted, and the work carried out by the Works Committee at the request of the Public Health Committee.

Surbiton.—The Council has accepted the tender of Messrs. Dick, Kerr, & Co., at 33,468l. 15s. for the installation of the northern sewers, plant, etc., in connexion with the new sewerage scheme. Twelve tenders were received. Messrs. Forryth & Mauls, the Architects to the Board, have been instructed to report upon the best way of extending the Council's offices.

FOREIGN AND COLONIAL.

The Alabaster Industry, Italy.

Owing to the competition of Germany and France, the marble and alabaster commercial statuary, which constituted until lately one of the most flourishing industries in Florence, is (writes the British Consul) passing through a very serious crisis. Most of the sculpture seen in the Florence shops is not marble, but alabaster, which, while very transparent in its natural state, becomes opaque and slightly granulous, similar in appearance to the Carrara and Serravezza marble, through the process of baking. Not being, however, so hard, it has the advantage of being more easily worked, with an economy of 50 per cent in labour. White alabaster is only to be found in the province of Pisa, and, we are informed, that a group of Tuscan financiers is negotiating with the quarry owners to secure a monopoly in this for the purpose of combating foreign competition.

American Cement Production in 1910.

Statistics collected by the United States Geological Survey show that the total quantity of Portland, natural, and pozzolanic cement manufactured in that country during 1910 amounted to 76,934,675 barrels, valued at 13,610,554l. Compared with the previous year, this represents an increase of more than ten million barrels, or 15.3 per cent. in quantity and 26.9 per cent. in value. The total output of Portland cement for the same year was 75,699,435 barrels, equal to nearly thirteen million tons, valued at 21s. per ton. The output of pig iron in the United States for 1910 was 27,288,545 tons, valued at 61s. 6d. per ton. Hence the production of Portland cement was approximately 47 per cent. that of pig iron in quantity and 16 per cent. in value.

The foregoing figures suffice to make clear that the term "cement age" has not been applied without reason to the present epoch.

Building Work, Spain.

The *Gaceta* of August 1 notifies that tenders will be opened on September 5, at the "Dirección General de Obras Públicas, Ministerio de Fomento" Madrid, for carrying out the first section of the harbour works at Adra, in the province of Almería. The price is put at 1,357,000 pesetas (about 72,000l.). The *Gaceta* of August 2 notifies that tenders will be opened on August 31 at the "Ministerio de Instrucción Pública y Bellas Artes," Madrid, for completing the building in course of erection for the General and Technical Institute of Granada. The upset price is put at 401,000 pesetas (about 15,000l.).

Although the two foregoing contracts will in all probability be awarded to Spanish firms, nevertheless the carrying out of the works may involve the purchase of some materials out of Spain.

Railway Works, etc., Netherlands East Indies.

According to the *Nederlandsche Staats-courant* of August 1, the Netherlands East Indies Budget for 1911 contains provisions for:—(1) An increase of 350,000 gulden (29,000l.) for building the railway from Bandjar to Parigi; (2) an increase which will now bring the total amount set aside for the erection of the Colonial building at Amsterdam up to 278,800 gulden; (3) an increase of 383,500 gulden (32,375l.) for the construction of steam tramways from Tjikamp to Lemahabang and from Rambipodjo to Poeger.

Abyssinia.

The following information is from the report by H.M. Consul at Adis Ababa (Major C. H. M. Douglas-Wylie, C.M.G.) on the trade of Abyssinia in 1910, which will shortly be issued:— There is an import of ready-made window and doors, etc., by the railway. This import will doubtless increase with the arrival of the rails in Adis Ababa. Wood is scarce, bad, and very expensive in Shoa. The same increase will probably take place in iron girders and building materials generally.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

SEPTEMBER 4. — **Newcastle-on-Tyne.** — The Education Committee invite from architects practising in Newcastle designs for a senior mixed school and a junior mixed school, each to accommodate 365 children. Assessor nominated by R.I.B.A.

SEPTEMBER 5. — **Stegness, Cottage Hospital.** — Mr. E. R. Sutton, F.R.I.B.A., Assessor. Premium 154, 16s.

SEPTEMBER 9. — **Pontefract.** — SWIMMING-BATHS. — Open to architects of the West Riding of Yorkshire. Particulars from the Borough Surveyor.

LAW REPORTS.

BEFORE THE OFFICIAL REFEREE
(MR. MUIR MACKENZIE).

Contractor's Action against Building Owner:
Minter v. Waldstein.

The hearing of this case was continued last week, it being an action brought by Mr. F. G. Minter, a builder and contractor, against Mr. Charles Waldstein, Professor of Art at Cambridge, from whom he claimed £2,750, the amount payable in respect of a certificate of Mr. Frederick Wm. Foster, an architect, and in respect of a contract made between the plaintiff and the defendant for the carrying out of alterations and additions at Newton Hall, Harston, near Cambridge. Defendant alleged that the work was defective, and counterclaimed against the plaintiff for 10,000 damages.

Mr. Lewis Thomas, K.C., and Mr. G. R. Blanco White (instructed by Mr. V. Bianco White) appeared for the plaintiff; and Mr. Clavel Salter, K.C., and Mr. F. St. John Morrow (instructed by Messrs. Withers & Co.) represented the defendant.

At the conclusion of Mr. Salter's address on behalf of the defendant Mr. Lewis Thomas replied upon the whole case on behalf of the plaintiff, and in the result the learned Official Referee reserved his judgment.

Case under the London Building Act:
Failure to Give Notice.

On July 4 Mr. E. G. Rayson was summoned at the Greenwich Police Court by Mr. Baxter Greig, District Surveyor for Deptford, for failing to give notice for sundry works carried out on the premises of a florist in the Lewisham High-road. The work consisted of removing the decayed wood sill and vertical bars to the side and end of conservatory.

The defence was that the work was only necessary repair, and as such, under sect. 209 of the London Building Act, no notice was required to be given. The magistrate adjourned the case, and has now given a decision in favour of the builder, instructed by Messrs. Marchant, Newington, & Tipper, and Mr. Louis Jacob, F.S.I., A.R.I.B.A., was in court to give evidence in support of the builder, but was not required after the cross-examination of the District Surveyor. Mr. Garland Wall appeared on behalf of the District Surveyor.

PATENTS.
APPLICATIONS PUBLISHED.*

- 10,230 of 1910.—Abson Ercolani: Apparatus for moulding or waving wood or other material.
- 15,274 of 1910.—Charles Fairbank: Tenoning tool and workholder for use therewith.
- 17,412 of 1910.—William T. B. Masters: System of treating the exterior walls of old or new buildings to imitate stone.
- 18,649 of 1910.—Cecil Walton and John Beaumont, Walton: Reciprocating conveyors, screens, or the like.
- 19,635 of 1910.—Charles McRae Grey: Rolling of flanged metal sections.
- 20,149 of 1910.—John Wulstan Twynberrow: Method of and apparatus for mixing the ingredients of concrete and other substances.
- 20,164 of 1910.—Frank Iliff: Heating and ventilating apparatus.
- 20,541 of 1910.—John Jesse James: Stair-rail eyes and rod brackets.
- 22,552 of 1910.—Thomas Benjamin Colman: Revolving doors.
- 25,834 of 1910.—Hermann Cohn: Processes of and devices for manufacturing concrete boards or plates as a substitute for wooden boards or planks.
- 27,855 of 1910.—Hermann Kaye: Hand-rammers for paving purposes.
- 1,732 of 1911.—Ferdinand Burchartz: Apparatus for making hollow building blocks.

*All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

4,569 of 1911.—Heinrich Christophery: Manufacture of handles for doors, windows, and the like.

10,058 of 1911.—Arthur Henry Ehrlert: Sliding window-blinds.

11,308 of 1911.—Gebr. Korting Aktiengesellschaft: Apparatus for creating artificial draught in smoke stacks or chimneys.

11,716 of 1911.—John Daniel Wilcox: Door latches.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); the relating to advertisements and other exclusive business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at his office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay or inconvenience may result from inattention to this.

Any communication to a contributor to write an article or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, which, if unsatisfactory, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of proof of an article in type does not necessarily imply acceptance.

N.B. Illustrations of the First Premiated Design for any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

*Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

MODERN SHIPS AND THE ARCHITECT.

MR. BURTON T. BEACH, writing recently in the *New York Herald*, presents to our consideration a variety of seemingly old but, one must admit, immutably probable pictures of the mammoth "leviathan" ocean greyhound or "floating hotel," as it willvelop during the next few years. The conception of a vessel twice the size of the *Mauretania* is, if possible at all, quite easy of achievement, since

structures of the kind have long ago outstripped the human scale. They may increase in size now, and no one be really astonished, until lack of adequate harbourage puts a period to their growth.

They are the material embodiment of an age whose god is the god of Transit, whose temple is naturally the hotel. In the liner, as it pursues its inhuman way, combining the satisfaction of his desire for luxury with that of the necessity

for speed, the modern finds his true Ark of our later Covenant, which gives man sovereignty in all material things on the condition that his soul shall be ruled thereby in its turn. It is not unlike the contract which was made by Dr. Faustus. And in this agreement the architect in his capacity as ingenious designer of hotels, clubs, and the like has his place, his function.

In the Ark of Material Comfort, then, he is increasingly to have scope for

the exercise of his gayest ingenuity. Rivalry between the companies in the matter of luxury may easily surpass the possibility of further aggrandisement in bulk. The items which make the prospect bizarre would be what is called sensational were they not essentially so absurd. For if humour lies in the association of the incongruous, the idea of a swimming-bath on board a ship is surely ridiculous. The news that one company contemplates increasing from 4,000*l.* to 10,000*l.* its annual outlay for the wireless service to the papers published on board seems, and is, a much tamer proposal.

These vessels, structures, accretions—"things"—have already lost most resemblance to the world-old conception for which the word is "ship." As far as the reception-rooms, lounges, corridors are concerned, the cambert-batter which formerly kept things of necessity "ship-shape" has almost disappeared. A spacious staircase, with lifts on either hand, supplants the old companion-way. Dining-rooms and drawing-rooms, bars, smoke-rooms, *cafés*, lounges, libraries, and writing-rooms, hardly satisfy the requirements for which, but a decade ago, the simple saloon, drawing and smoking rooms sufficed. And to accommodate them all the *Aquitania* is to have seven decks. Somewhere within the walls of the new White Star liner *Olympic* there is to be a gymnasium fitted with the completeness which Americans demand and the swimming-bath we mentioned above big enough for a free dive.

For with increasing size comes immunity from the terrors of the sea, of which men as a consequence begin to find the value. A voyage which formerly passed in fasting or on a diet of gruel and tea, is now consumed in a close succession of prodigious meals, is more likely to end in the desolation engendered by surfeit than in the exhilaration of unwonted fitness and the incitement of a fresh beginning. Hence the need for exercise. All development tends to reproduce the conditions of dry land. There is the captain controlling his not inconsiderable polity by telephonic communication. There are the various state departments—the purser, for instance, with his clerks. There are the citizens, upper and middle classes, and away down unseen in the stokehold sweat the grimy submerged. The naval architect is a civic designer of a compact and complex city, and he is beginning to find in this city, as it grows in size, wealth, and security, that more than space, economy, and strength is demanded of him. Following the analogy of the cities of the land, he finds that an increasing measure of comfort and adornment is required. For this he must call in the architect on land, whose cities centuries ago attained the stage he is just reaching, although in another aspect, that of organisation, economy of means, and a sense of entity, his achievement is far from being equalled.

It may be objected that the adornment of ships is no new thing; that indeed ships have been beautified in a decreasing degree as the age of the Argosy receded. That at no time before this present have vessels so unmitigatedly utilitarian been

permitted to brave the seas. And this is undeniably true. In contact at times with the land on which, after all, they are built, ships have of necessity partaken of the spirits of their ages. At first they are as some mythic beast, and eyes are painted on them that they may see the way, though there is no path; they are hung about with charms against the reputed demons of the deep. They are built in traditional shapes, as are the static structures of their time. As these, they become fairer to the eye, are formed to the mind of man rather than in fear of the gods. At last almost every surface timber is shaped into some vain form faintly reminiscent of aboriginal myth, or merely in keeping with their fully-developed sex, for they have now acquired the sex with which the mariner, unwilling Benedict for longer and longer spells, would endow the thing he serves.

Suddenly a new barbarism sweeps away with iron utility the faint and moribund forms. Pale-metallic man sails, as the arbiter of civilisation, if you please, wherever he will. "Dirty British steamer" sinks the "stately Spanish galleon." "Quinquirame of Nineveh" has rotted long ago. *Esthetes* despair, as *esthetes* will.

Now it has been frequently remarked concerning architecture, that decadence sets in at just that point when decorative values outstrip structural significance, when the weight of adornment is more than its meaning can uphold. As on land so on the sea. When stem and taffrail curve like playful dolphins and berthings rise like cupola'd oriels over the waves, when hawse-holes yawn with lips and teeth replete, and carlings bend like ropes to the curve of the deck, on such a craft as Vanderdecken's cruising off the Cape, every bollard-head a *Hermes* and the quarter-rail a writhing bacchanal, the beauty of the wooden ship has reached the intolerable acme of decay—it is "baroque."

But note how, even at this point, each carved and painted piece is shaped and fitted to the integral structure. In no direction is an attempt made to reproduce the rectilinear conditions of horizontal earth and a constant gravity. The ship, a brigantine or barque, a galliot or chassemarrée, is one curve from end to end, and all is moulded in consonance with it. Contrast the aspiration of the modern monster. Ceiling and deck must be flat and square and the sides all perpendicular. And the luckless architect shall be called in to fit the given rooms with the frivolous trappings of his futile skill. So he panels and plasters it in the "Georgian" or "Louis Quinze"; gives an "Elizabethan" staircase and a lounge of tasteful trellis-work in the manner of a hotel or, what is really the same, the modern country house on a large scale. "Home from home" in fact—for those who like that sort of thing.

It is perhaps erroneous to assert that the tendency which renders possible afloat the architectural adornment adapted to dry land is entirely the fruit of conscious effort on the part of the designers of the larger vessels. Admittedly it is true in part; indeed, as far as saloon passenger quarters are concerned, this end is kept in view. But

it is rendered possible by the mod conditions of construction which ensue the vessel to be so monstrous that the curve from stem to stern, if pressed would be lost, and so steady that in but considerably inclement weather customary direction of the force of gravity is maintained. And therefore it may be argued, repugnant as it is to conceptions of the identification of structural achievement with aesthetic intent, that the present practice of applying adornment developed on land is logical and right.

But even supposing that the mere historical trappings are justifiable buildings (it is not our purpose here to discuss this immediately irrelevant point), surely on board ship they become insincerely frivolous in function and effect. Our ideas of aesthetic rectitude cry out against a procedure as careless intellectually in its inception, as it is bizarre in its result.

No. The ship is an entity compared to the city of our dreams. Like the city it is defined, of necessity, in its content. Straggling suburbs it has none, save negligible deck hamp comparable to the sheds and "lean-to's" outside a mediæval town, all easily abandoned. Within the disposition of its parts there still lie the husks of the seed of the aboriginal boat. Unbroken tradition has flowed through all the seeming change of different purposes at times—and even now in the "leviathan" is not quite lost. In the city afloat, through the city of our mind, there goes the spirit of forethought, certainty, and justice in the precise apportioning of space and position to the various divisions according to the importance and requirements of the functions they perform. From the crow's nest, justly holding the watchman against the chances of the world without, to the tunnel where revolves the shaft upon which the whole concern relies, each part will be found in its place, at once practical and symbolic, to a nicety for which no parallel is to be found in any association of functions so diverse upon dry land.

And it is in the peculiar aptitude of its conception that the true decorator of the vessels of the future will find the basis of his scheme, on the implicit symbolism of each part that he will depend for his motives, in the development of structural forms that he will find his means. It is useless at present to guess at the result and to imagine it is impossible. The companies will continue to pile the Pelion of obfuscating adornment upon the Ossa of prodigious size till the gods are assailed and, discomfited, retire. But in the meanwhile structural forms will be outstripping the mere necessities of their purposes, and in the moulding of brass and painted iron into shapes and curves and harmonies beyond the customary graceless minimum of utility the beautifier of ships will find at once his inspiration and his means.

PROPOSED L.C.C. TRAINING COLLEGE.

The London County Council propose to build a training college for teachers at St. Quintin's Park, in view of the fact that the present training accommodation is far below that required.

NOTES.

THE agenda for the forthcoming Trade Union Congress, which opens September 4, has now been issued, and besides the standard dishes, such as nationalisation of the railways, the eight hours' day, etc., there are resolutions relating to the Insurance Bill, and calling for a Commission to inquire into the working of the Workmen's Compensation Act, as well as an anti-military resolution suggested doubtless by the strikes, as it somewhat humorously describes the existence of a regular standing army as "a menace to popular liberty." Amongst the resolutions relating to the Insurance Bill is one which declares "that no scheme can be satisfactory which is not wholly—or at least mainly—non-contributory, and in which the bulk of the funds necessary are not provided by Parliament." We have always foreseen that such a contention was certain to be put forward, and in our article on this Bill (May 12) we said:—"One thing in connexion with the Bill should most certainly be made clear, and that is that if any attempt is made to whittle away the contribution on the part of those to be benefited by the scheme the Bill must forthwith be laid aside. Too many Bills have been introduced on social subjects based on contributory principles only to emerge from Parliament non-contributory and purely eleemosynary measures." We shall revert to the subject of the Congress at the conclusion of its sittings.

this kind to receive statutory protection? That is a question we should like to see raised and answered in the near future.

Unventilated Bedrooms.

DR. KING WARRY, the Medical Officer for Hackney, in submitting his annual report to the Council (see p. 257) draws especial attention to the fact that under the existing by-laws it is possible to build rooms, which are used as bedrooms, provided only with a ventilating opening in the wall, too frequently promptly blocked up by the occupant on the first cold or windy day, thus leaving the room without ventilation of any kind—a highly undesirable state of things. Dr. Warry advocates that it should be compulsory to have a fireplace in every habitable room. We cannot follow him as far as this, recognising that in most cases the small bedroom never sees a fire from year's end to year's end. At the same time, we quite admit the unsatisfactory character of the "hole in the wall," and think it would be reasonable to demand a ventilating flue carried to the top of the building and provided at the outlet with some means of inducing extraction. In the numerous industrial dwellings and small flats that are rising in and around London there is certainly an opportunity for a more systematic method of diffusing warmth; it must, of course, be inexpensive, but it would be very desirable that smaller rooms should be able to borrow a little heat from the principal room or rooms, considering how seldom they will be permitted a fire on their own account. Perhaps the simplest solution is the American one of abolishing the door—after all, the door is but a survival of barbarism—and we think Dr. Warry will agree with us in the view that a small and somewhat cramped flat is far more healthy if you take all the internal doors off their hinges and substitute curtains of a hygienically suitable material.

General Strikes.

In these days when general strikes are threatened on behalf of any discontent in any particular trade or industry a point arises both under the Conspiracy and Protection of Property Act, 1875, and the Trade Disputes Act, 1906, deserving serious attention. The general strike is a modern development since the passing of the last-named Act, and it may be doubted whether when the above Acts were passed the protection offered by the Acts to persons taking action "in contemplation or furtherance" of trade disputes was intended to extend to persons having no dispute amongst themselves, i.e., between employers and employed, but joining in disputes outside their own employment or business. The point is of the greatest importance, the House of Lords, as we have recently pointed out (*The Builder*, August 18), having held that for some sections of the Trade Disputes Act, 1906, to apply, a dispute must be either imminent or in progress. We submit that this must have been intended by the legislature to apply to disputes between employers and their workmen and not to extend where acts are performed by persons having no cause of dispute as regards their own employ. Where no cause of dispute exists in a particular trade, but the employees join in supporting a strike in other trades, this in itself appears to constitute an act of intimidation, and an act of intimidation not only levelled at their employers, but at the general public. Are acts of

Sanatoria and Dispensaries for the Tuberculous.

THE proposal to spend one and a half millions of public money on tuberculosis sanatoria in England has evoked criticism from Mrs. Amy M. Elkin, who writes to the *Times* to point out that it is of first importance to establish local dispensaries on the lines instituted in 1887 by Dr. Philip in Edinburgh, and since widely adopted in Germany. Mrs. Elkin takes the view that, though sanatoria may be looked on as the best possible means of education for the consumptive apart from any improvement derived from the treatment itself, it is of even greater importance to obtain the hold on the initiatory stages of the disease that can only be secured by means of properly staffed local dispensaries in touch with the districts in which consumption is fostered. We certainly think that some of the proposed expenditure should be allotted to dispensaries in lieu of sanatoria, having regard to the relative effect of each, in proportion to the expenditure, on checking of the disease, and the influence that dispensaries are able to exercise on the manner of life in our populous centres.

A Master of Arts and Crafts.

Does the position of Principal of the London County Council Central School of Arts and Crafts, giving the whole of his time to the work, demand a higher salary than that of Director of the National Gallery (1,000*l.*)? Apparently so, for the four-figure income advertised six months ago failed to attract the Head desired, and 1,200*l.* is now offered. The post is obviously one for an architect, and it might have been thought that among the large number of men with architectural training, with sound knowledge of design and craftsmanship, and, in addition, with some administrative ability, one could have been found to forego the uncertain fruits of general practice and to accept without regret the cheques, regular and not meagre, of the London County Council. Whether the best man will be tempted by the extra 200*l.* a year to come forward and be prepared to sacrifice all his professional ambitions and independence is doubtful. The whole-time clause was too rigorously enforced probably in dealing with the original applications; a certain elasticity is desirable. No one would suggest, for instance, that Sir Charles Holroyd performs his duties at the National Gallery less earnestly or efficiently because as a recreation he draws and etches; and the Principal of the Arts and Crafts School would be just as useful if to some extent he were allowed to exercise his artistic or literary powers outside the School. In fact, his position would be strengthened by being in touch with the outside world, and the right man could be trusted not to abuse his privileges. The solution of the problem probably would be found in the appointment of a Vice-Principal responsible for the detail work of the School.

THE STORY OF THE BRIDGE.

BY WALTER SHAW SPARROW.
IV.—IN THE MIDDLE AGES.

MEDIEVAL England was a forestal country, and in woods along many roads and byways footpads and bandits lay in wait, as ready to cut a throat as to broach a tun of wine. Rivers were feared then by pilgrims and horsemen, not only because fords were very common, but because thieves knew that an ambush near a ford was particularly unpleasant to anyone who had to make his way through it. Till the XIVth century, and even later, fords were in vogue at and near many towns of the lesser sort; and what their dangers were and how their guardians behaved to travellers are very well described in a picturesque old ballad written in the time of Henry V. "Another blisshed besines is brigges to make," its poet cries, thinking of the unfortunate travellers who were washed from their saddles into a flooded river:—
"And som oute of their sadels fletts [fall] to the ground,
Wente forth in the water wist no man where,
Eyre woken after or they were f founde,
Their kyn and their knowlege, [acquaintance] caught them up with care."
And the life and limb tax claimed by rivers was not the only trouble. The keepers of a ford knew no pity, but got their toll in relentless ways, taking bread from the beggar's wallet, and "a hood or a girdle" from "the pore penyles." Pretty often, again, great woods encircled little riverside towns and manors, so that outlaws after dark could steal up close to the houses and the bridge; it was

The Monnow Bridge, Monmouth.

then that pilgrims and wayfarers welcomed with the greatest relief the cresset-lights that glimmered from some friendly building on the bridge—a chapel, a defensive gateway, a small bickering windmill, or a good house buttressed up against a pier and rising above the parapet.

On all the many pilgrim roads the absence of a bridge here and there was a grievance and a danger that affected everybody, yet fords gave place to bridges very slowly, and the reasons are not really at all hard to find. For example, it was a long time before bridges won a good reputation among the people. Wood being abundant everywhere, they were often timber bridges, rudely built, we may believe, for many of them were carried away by floods, as Matthew Paris relates in his monastic journalism, which belongs to the XIIIth century. Country-folk had their hearts set on the safety of stone bridges, which, like other ideals, were not easy to make real. Money enough had to be collected, and leave from the King had to be angled for; hence the old custom of laying the first stone in this or that King's name. Remember also that rivers flowed through private lands, sometimes with rival owners on each bank, who put a veto on the whole project, either in a spirit of perverse antagonism or because a stone bridge might benefit one landowner more than another. It was always easy for the stronger man to say that the coffer dams used in founding piers diverted rivers from their natural channels and caused inundations, particularly after storms. I think this objection was raised pretty often, as piers were founded here and there in a very primitive fashion, just by throwing down stones and mortar till a bed of masonry rose above water-level. Old Bow Bridge was grounded in this way at Stratford-atte-Bow, XIIIth century; and the same method of construction was used in much later days.

And another point to be kept in mind is the fact that in those warlike times everything was looked at from the standpoints of attack and defence. Bridges as well as warriors needed armour, so gateways and towers were built in a military fashion, and sometimes one arch was a drawbridge. Take Old London Bridge as an example. One of its twenty arches—the thirteenth from the City end—served two purposes, being a toll-gate for merchant shipping and a draw-bridge to gap off enemies from the town. It served this purpose effectively in 1553, when Sir Thomas Wyatt and his insurgents wished to enter London. It was easy for strangers to know which was the movable arch, because this defence was connected in all popular talk with the tower that rose beside it, a terrible and gruesome tower, for

on its summit executioners displayed the heads of decapitated persons, who ranged from common bandits to the great Sir Thomas More.

Some defensive bridges in Old England had an important look as late as the reign of George III. Thus the Welsh Bridge at Shrewsbury has quite a noble air in engravings of that period. At the present time our gateway and towered bridges are plain specimens of this mediæval tradition. One at Warkworth, Northumberland, belongs to the XIVth century. It has a squat tower with plenty of stonework above the gateway, but the gateway itself is so low and narrow that a gipsy's caravan cannot pass through it. As to the bridge, its simple dogged architecture has points worth noting. There is the roadway, which has a pleasant line dipping towards the gateway, and having a triangular recess for the convenience of travellers in the great central pier. The gateway is at some distance from the abutment, and the wall that unites them has a curve that repeats in two places, but in a modified manner, the line of parapet formed by the recess. Although the pier midstream is triangular, an attempt has been made to mask the false principle involved in this type of cut water; that is to say, the mason tried to thrust into the oncoming river a larger bulk of masonry than was usual in sharp-beaked piers and buttresses. It is odd, but mediæval bridge-builders very often believed that a pier, however substantial in bulk, ought to

cut water like a knife, instead of presenting a bold surface to the swift current, a surface having weight and resistance, as in those occasional piers in French bridges of the Limousin, whose sectional form is similar in shape to a Gothic drop arch, or else to an arch which is formed on an equilateral triangle. It is clear that a section of this kind has a greater surface than that of a triangle, and consequently greater power and opposition.

Further, when you remember that Warkworth Bridge belongs to the XIVth century, do you not expect to find pointed arches, since these need less centring and have a lighter side thrust, necessitating less masonry and, therefore, less expense in the building of piers? Yet the ribbed arches are round. Northern England has ever been noted for two characteristics—a discontent that is said to be a Radical in politics, and a stubborn opposition to new knowledge and to young movements. All this may be read quite clearly in those humble stalwart bridges which in northern counties unite the Middle Ages of hard work with our days of infinite talk. It is to Lancashire that you must go, for instance, if you wish to study in old bridges the retention of Romanesque forms.

I do not know whether the great pier of Warkworth Bridge is solid all through from its foundation to its roadside recess. But let us remember that many mediæval piers, like a good many of those built by the Romans, were solid shells of stone filled up with beaten earth and gravel.

As a fair type of the defensive bridge in Great Britain, I have chosen for illustration the Monnow Bridge at Monmouth. The bluff old tower has rounded ends facing the river, and one arrow-hole can be seen in my photograph. There are machicolations above the gateway, flanked by arrow-slits, and just below the roof is another aperture through which stones could be hurled or molten lead poured. Horatius Coeles would have been glad of a tower like this on the Pons Sublicius. It was not till much later times that the Romans, by building triumphal arches on the roadways of important bridges, created a tradition that passed through the Middle Ages onward to our own time and to contemporary work.

The arches in the Monnow Bridge are round, and note that they are *arcs doubleaux*, as the French describe those vaults in which at certain intervals a concentric arch is superimposed, or the vault itself at certain places is of double or greater thickness than at others, so that bold ribs project from the belly of arches. *Arcs doubleaux* are common in old English bridges, and some of the most interesting are Elizabethan, notably in the beautiful Wilton Bridge across the Wye,

Chantry on Wakefield Bridge, Yorkshire.

Bridge Chapel, Bradford-on-Avon, Wilts.

Photo by C. S. Set of glass.

near Ross, in Herefordshire, built of reddish sandstone in 1599. In the Wilton Bridge the voussoirs are notched or joggled into each other in accord with that Norman fashion which left a history of itself in such work as the fireplaces at Fountains Abbey. Many students of the evolution of bridges give sufficient care to the ring of arch stones. In the Monnow Bridge at Monmouth a slight tentative effect has been made to give the arch stones some freedom from the oscillation sent through the spandrels when a great weight passes over an arch. A slight tentative effect, I repeat, because the voussoirs are not been made independent from the spandrels. To find arches of this type we must go to the noble Valentré Bridge at Cahors, dating from the XIIIth century. Five acute-angled piers rise from the water in a high parapet, forming crenelated recesses on each side of the roadway; and the voussoirs of the six principal arches, gracefully pointed, are, as Viollet-le-Duc says, extradosés, like the round arches in the best Roman bridges.* This makes the ring of each arch independent from the construction of the spandrels, so that they keep their elasticity, and cannot pass on through the rest of the bridge any tremor sent down from the roadway into the spandrels. On the other hand, when arch stones are unequal, tuck in their haunches than in their crown, oscillating movements go along the full length of a bridge, causing undue fatigue to the piers, and sometimes a very noticeable crumbling, as in the bridge by Irigo Jones at Llanrwst. Perronet, the greatest French engineer of the XVIIIth century, forgot this effect of repercussion when he designed and built Le Pont Louis XV. at Paris; and in the hope that he would remedy his mistake he jammed his arch stones together with iron bolts along the soffit, as if metal fastened into one could never in the course of time become a destructive agent.

The architect of Valentré Bridge was wiselier than Perronet, every arch in his work being an elastic bow that is able to move between two piers without conveying its oscillation beyond those supports. To our modern eyes, no doubt, there are too many arches across the River Lot at Cahors, but this was necessary in the Middle Ages, and for two reasons. It was a necessity of defence, because narrow

arches were easier than broad ones to protect from the roadway if an enemy wished to assemble boats under a bridge; and since in the frequent wars of those days a bridge had often to be cut as a final resource against defeat, it was essential that the destruction of one arch should not upset its neighbouring piers by the withdrawal of a counterbalancing thrust from one side of the piers. Many piers of a large size were essential, above all, when the greater lateral thrust of round arches had to be considered in its relation to a bridge cut in a single place. Further, bridges in the Middle Ages were built very slowly, bit by bit, their construction lasting from ten to twenty years; and as war at any moment might stop the masons, there was a great need that every arch should have for their support such strong piers as would be equal to the stress and strain of all eventualities. From this standpoint, then, as well as from the militant strategy of bridge-building, many powerful piers were necessary, and a bridge gained very much in value when its pointed arches had in their voussoirs the characteristic which all authorities praise in the Valentré Bridge at Cahors.

But it is time now to say a few words about bridges with chapels. These became common in the XIVth century, and in most cases they were built up against their bridges from the water-level so as to be like extra piers in times of flood. We are fortunate enough to possess four examples at the present time, despite the vandalism which followed the suppression of monastic houses by Henry VIII. The chantry on Wakefield Bridge suffered greatly in those days, and its desecration continued till the year 1847, when its beautiful architecture, dating from the time of Edward III., was restored at a cost exceeding 2,000*l*. Some authorities believe that the style belongs to Edward II's time, but the endowment was certainly made by Edward III., in a charter written at Wakefield: he settled "10*l*. per annum on William Kaye and William Bull and their successors for ever to perform divine service in a chapel of St. Mary newly built on the bridge at Wakefield." There has been much controversy over this bridge chapel, so I refer you to C. A. Buckler's "Remarks upon Wayside Chapels," and to N. Scatcherd's "The Chapel of Edward III. on Wakefield Bridge." Perhaps the precise date of the charter of endowment may have been 1362, a jubilee year, in honour of the fiftieth birthday of our third Edward. This king did much to protect the wool trade, and Wakefield was dependent upon woollen handicrafts, and an ancient tradition says that the chapel on Calder Bridge was built by the

inhabitants of Wakefield. Another endowment seems to have been made by the fourth Edward, in memory of his father Richard, Duke of York, killed at the battle of Wakefield in 1460. It is certain, I believe, that the chantry was much visited by local pilgrims who came to do honour to a statue of the Virgin.

Yorkshire owns another chapel bridge, the one at Rotherham, first built in 1483, but it has less charm than that which belongs to the little dovecot chantry on the picturesque bridge at Bradford-on-Avon, Wiltshire.

Do we possess a bridge buttressed by a watermill? Bridge and mill are often close together, but not so near as they are in some French examples. In the Middle Ages they often formed but one construction, built entirely of wood. A good example survived at Meux, in Brissac, till 1835, having weathered storms since the XVth century.

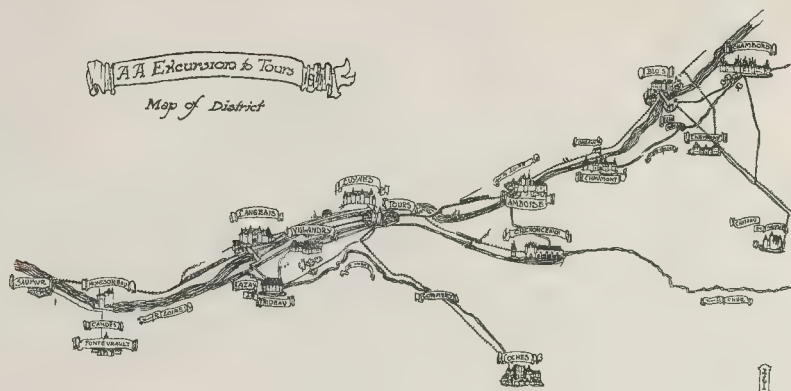

FORTY-SECOND ANNUAL EXCURSION.*

Fourth Day—Thursday.

It had been intended to break the journey to Loches at Cornery for the purpose of inspecting the remains of the XIIth-century Benedictine Abbey there, but the fatiguing nature of the weather led to a change in programme, and the party proceeded direct to Loches by an early train and devoted the whole day to pursuits rather archaeological than architectural chiefly about the castle and church. The site of Loches, on the banks of the Indre, was inhabited by the Romans, and a monastery was there in the Vth century, round which the town and castle grew. The castle as now existent is of two main parts, the Château Royal, dating from the XVth and XVIth centuries, and the Donjon of Fulk Nerra, of the eleventh and twelfth centuries, to which Louis XI. added the Tour Neuve and the Martelet, containing the noisome subterranean cachots which he put to such cruel use in the XVth century. Between these two parts stands the unique collegiate church of St. Ours. The great donjon—the usual square Norman keep, entirely ruinous within—differs from the common practice in England in having in place of flat pilaster buttresses a series of bold projecting shafts or engaged columns. The various cachots were inspected, but their interest is human rather than architectural, and no description is needed. The Château Royal is more attractive. On the side overlooking the town the buildings to the left are those of Charles VII., the round tower at the end being known as the Tower of Agnes Sorel, and containing her tomb, with a beautiful sculptured effigy displaced from the church. The extension on the right is the work of Louis XII., and its abandonment of the machicolations, tourelles, and battlements of the earlier building is evidence of the continued progress to more settled times. In this building is the delightful little oratory of Anne de Bretagne, a sumptuous piece of flamboyant design carved on every surface with her badges of the ermine and the knotted cord. The church of St. Ours, which

* Continued from page 215.

* This characteristic is particularly evident in the remains of the great Roman bridge at Narni, in Italy. The great arch stands to this day, and the upper edge of the ring is moulded and rimmed, so that the arch stones lock isolated from the masonry surrounding them. The arch at Narni is 150 ft. wide and 100 ft. high. The bridge was built by Augustus Caesar. It joined two mountains together across the River Nera, and formed part of the Flaminian Way in the country of the Sabines.

which a new wall and the soffits are elaborately enlaid in stone with medallion portraits and pendants curiously worked to the rake. Now a national monument, the chateau is not inhabited, and its interior rather suffers from the absence of furniture save a few specimen pieces. Externally, however, there is no denying the charm of the work, which the cold light of reason cannot destroy. Seen in the strong sunlight, the dazzling creamy whiteness of the stone, the general delicacy of design, the lofty billowy roof of rough grey slates with old age and finials, the intricate shadows and reflections all combine to produce an impression which no illustration can do justice. The outer buildings enclosing the forecourt are also most effective design, and no better view can be had than that looking up the avenue through the main gates with their fine piers, directly towards the entrance, though the simple severity of the south front with its corner angle turrets, four narrow dormers, and wider central gable springing from the roof slope is also very delightful.

Again the party was reluctant to leave, but move had to be made to Langeais, which a further half-hour's drive enabled them to reach till in ample time for profitable study.

Langeais, the Roman Alingavia, has probably been a fortified place from prehistoric times, and has been since occupied by a succession of castles. Remains of Roman work are still visible in the foundations of the dungeon keep, rebuilt about A.D. 1000. A fort was built here by Fulk Nerra, the ancestor of our Angevin kings, of which the outer shell remains. Following this a new castle was built by Pierre le Brosse, a favourite of Philip III.; this was occupied by the English during the Loire campaign of the Black Prince. The present chateau was built in 1464 under the direction of Jean Briçonnet, first mayor of Tours. Though still fortified, it shows signs of the coming change in that its fortification is practically confined to its outer face, which has circular flanking towers and machicolations, while the inner side shows only a plain overhanging eaves pierced by lofty dormers and a series of slender stair turrets. It is intermediate in development between the stern and rugged work of Loches, and such buildings as Chambord, Azay-le-Rideau, or Blois, a combination of stronghold and house. The plan is an irregular L shape, the shorter arm at an oblique angle with the main wing, in which is the gate-tower approached by a drawbridge. The chateau was occupied and filled with old furniture, chiefly of contemporary date, from which one is able to judge to what extent some of the other buildings visited suffer from the lack of this feeling of life. The most beautiful rooms are the Great Hall (in which Anne de Bretagne was married to Charles VIII.), and the room over, both in the short arm of the L. The original chimneypieces of these two rooms are alone worth a visit to see and admire, even though sketching is not allowed. In common with the other chateaux of the district most of the principal rooms have glazed tile floors of

excellent colour and design; the floor in the Great Hall is of a different type—of dull red quarries—with occasional heraldic emblems in slight relief. The passage of the battlements is complete and open to inspection, and a walk round this pentise affords a very good idea of the methods of medieval warfare.

St. Martin built a church at Langeais, of which there are some remains near the east end of the present edifice, most of which has been rebuilt in a style so bad as to defy description. The triple apsed east end and a fine western tower and spire remain, probably part of a church built by Fulk of Anjou in the XIIth century.

Little time remained for the chateau of Luynes, which was reached about 6.30. Magnificently situated above the little village over which it towers, this building makes an ideal subject for the water-colourist. It consists of an immensely thick enclosing wall with eight round towers, all of which have lost their machicolations and are capped with conical roofs. This work is of coarse rubble roughly plastered, but towards the courtyard is a pleasant flamboyant brick and stone building which alone is inhabited. It bears considerable resemblance to the remains of the chateau of Plessis-les-Tours, and was built towards the end of the XVth century by the Seigneurs de Maille. At the end overlooking the valley of the Loire two Renaissance pavilions were built in 1650 by the architect, Le Muet.

At the foot of the castle hill is an interesting timber market hall, and in the village are several interesting old cottages, including one fine specimen of timber framing with the bracing arranged lozenge fashion and filled with brick nogging.

Sixth Day—Saturday.

An early start was made on Saturday for Saumur *en route* for Candés and Fontevault. Two hours were spent in the town, but the chateau (extensively restored) was not visited, attention being chiefly devoted to the late Gothic Hôtel de Ville, mainly of the XVIth century, but partly of earlier date, the older portion surmounted by a steep hipped roof with octagonal machicolated corner turrets, and central fleche with a curious vane rope-sending a heron surrounded by its young. The other interesting buildings of the town had to be reluctantly abandoned without inspection. Candés, the ancient Roman Candates, and the scene of St. Martin's death in 397 or 400, was reached by road. Its remarkable fortified church excited the greatest astonishment, and was certainly one of the most noteworthy buildings seen. The very lofty four-bayed nave, apparently late XIIth century, is on the lines of the German hall-churches. Its three aisles being vaulted at the same height. The vault tends to be domical, and is supported on tall clustered piers. Windows resembling the English lancet light this remarkable nave, and there is also a western rose partly blocked. The short sanctuary and apse appear to be earlier in date. The external design is equally

noteworthy, great battered buttresses rising sheer from ground to gable without a moulding or offset. On the north side is a very large gabled porch effectively ornamented by two bands of niches containing statues—one below the springing of the doorway arch, the other cutting across an expanse of plain wall as a sort of frieze halfway up. The angles of the porch and of the west front have square projecting turrets with machicolated and battlemented tops. Internally this extraordinary porch is vaulted from a central shaft like an English chapter-house and surrounded by sculpture. A short distance back from Candés is Montsoreau, a picturesque village clinging to the rocky bank of the Loire, and having a ruined chateau rebuilt in the XVIth and XVIIth centuries by the Comtes de Montsoreau. This is interesting as showing one of the features of Azay-le-Rideau anticipated in a Gothic building, dormers being carried by the machicolation in advance of the main walls, though in this case each dormer has a second story gathered in above. From Montsoreau the Loire was left, and at a distance of about four miles Fontevault was reached.

The great monastery of Fontevault was founded in the XIth century by Robert d'Arbrissel, a Breton priest, whose powerful preaching and magnetic personality gathered to him disciples to the number of several thousand, and almost resulted in his canonisation in after years. In the year 1098 or 1099 this company, comprising both men and women, invaded the Forest of Fontevault and there founded their religious colony, which took shape as a remarkable double monastery under the authority of an abbot. Over the central, or nuns' buildings, the abbot presided in person, while around were grouped subsidiary establishments under her supreme headship, comprising the monks' priory of St. Jean de l'Habit, the leper-house of St. Lazare, and the penitentiary of La Madeleine. Other establishments were afterwards added, notably an infirmary of St. Benoît, and perhaps a priory of St. Laurent. The convent followed the Benedictine rule with certain variations which practically constituted it a distinct Order, and as such it had afterwards branches both in France and England. Its connexion with the Plantagenet kings arose through the early support of the monastery by Fulk V., Count of Anjou, and grandfather of Henry II., and this connexion lasted into the XIVth century, both Henry II. and Richard I. being buried in the Abbey Church, as well as the hearts of John, Henry III., and perhaps Edward I. The abbey became one of the richest in France, and when dissolved at the Great Revolution was the scene of gross sacrilege and violence. Under Napoleon it became a house of correction, and to fit it for this end the buildings suffered great damage, particularly the church, where the four cupolas over the nave were taken down to the pendentives to allow the formation of a range of attics in the roof. These have lately been removed and the domes rebuilt, the restoration being yet in progress. A plan

of the monastery appears in Lenoir's "Architecture Monastique," and Viollet-le-Duc, who gives a plan of the church, has discussed its remarkable construction and its place in the history of French art. The aisled apsidal choir and the transepts present no exceptional features compared with the nave, which is without aisles and covered by a series of Angevin domes on pendentives, supported by pointed transverse arches, the whole making a

From Château Blois.

spacious vaulted hall, which is directly derived from Byzantium via Venice, Périgueux, and Angoulême. The royal effigies repose in a chapel opening from the south transept. As well as the church the cloister, chiefly of the mid-XVIIth century, and the chapter-house of the same date, are shown to visitors, and a glimpse is possible of the abbey kitchen, known as the Tour d'Evrauld, and once thought to be a sepulchral chapel, but the visitor is not encouraged to linger, and none of the other extensive buildings are open to inspection. The parish church, outside the confines of the monastery and hence more accessible, was also examined. It has a simple rectangular nave and choir with low groined vault with domical filling. In a transeptal chapel on the north side is an elaborate rococo altar and reredos. A picturesque wooden lean-to porch envelops the north and west sides of the nave. The abbey gateway, a well-proportioned pavilion of the mature Renaissance with finely designed Ionic pilaster capitals, was sketched by a majority of the members present.

The party left Tours early on Sunday morning for Paris, where it broke up with expressions of gratitude to the excursion hon. secretaries, Messrs. Talbot Brown and A. W. Hennings, for their arrangements, and to Mr. P. Cart de Lafontaine for his painstaking conduct of the party.

Secondary School, Bury. Block Plan.

BURY SECONDARY SCHOOL.

The design for the Bury Municipal Secondary School illustrated on this page was awarded the first premium in an open competition in which 140 designs were submitted. The building was completed in January last at a cost of 14,000l. The school was arranged to have as many classrooms as possible on the ground floor under supervision from the assembly hall. The cloakrooms, staircases, entrances, and cookery-room are all well separated from the rest of the school, and the latrines, while they are approached under cover and are closed in by the outer gates of the building, are entered from the open air, and adequately cut off from the school.

There is accommodation for 350 pupils, and in addition to the hall and classrooms there are laboratories for chemistry and physics, art room, cookery-room, and manual instruction-room. The walls are of thin "Nori"

facing bricks, which were not selected to obtain uniform colour; the roofs have rough Westmorland slates, and the woodwork is painted white.

The architect was Mr. J. Theo. Halliday, A.R.I.B.A., of Manchester; the contractor, Messrs. J. Byrom, Ltd., Bury. Mr. R. Nuttall acted as clerk of works.

GENERAL NEWS.

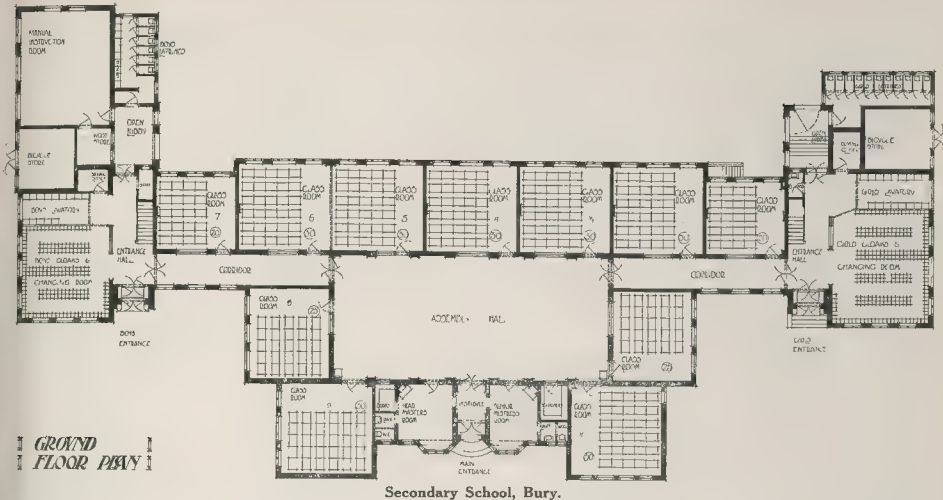

The Inland Revenue.

Mr. Edgar Harper, F.S.I., has been appointed by the Board of Inland Revenue to be Chief Valuer in succession to Sir Robert J. Thompson, F.S.I. Originally Mr. Harper was on the staff of the Metropolitan Board of Works, and afterwards acted as Assistant to Mr. Andrew Young, Valuer to the London County Council. Last April Mr. Harper

Secondary School, Bury.

Mr. J. Theo. Halliday, A.R.I.B.A., Architect.

unconditionally resigned his position of Statistical Officer of the London County Council, an event which was given some political significance.

Oxford Circus Going.

Another complete effect of an architectural pooh in London is in the hands of the house-reckers. We refer to Oxford Circus. The milliners' and jewellers' premises forming the south-east segment is going to be rebuilt. When the worst is said of the Regency and such and his work—that it is spectacular, if no scale, and insincere, indictments which he would combat—it is, at any rate, a conception, a coherent, piece of street design. Complaint and indignation is becoming as resolute to us to write as it must by now be tedious for our subscribers to read. We can only chronicle the fact; we understand that the new building will be of a kind capable of extension to the other segments so that the Circus may be architecturally a circus again.

The London Museum.

The objects of interest in the history of London which are being collected at Kensington Palace under the care of Mr. Guy Francis Faring, M.V.O., F.S.A., have been augmented recently by the permanent loan from the London County Council of the Roman boat discovered in the mud on the site of the new county Hall. That this relic of the past will be a popular feature of the London Museum may be prophesied safely.

The Crystal Palace.

As announced in the daily Press, the sale of the Crystal Palace and its grounds of about 200 acres is to take place on November 23, and those who hope even yet to save this national monument to the people are making a last effort to find the wherewithal to do so. It is proposed to hold another Mansion House meeting on October 23, and the Lord Plymouth and Lord Tenterden

are doing everything possible to prevent this property falling into the hands of the speculative builder. We sincerely hope that their efforts may be crowned with success.

Fire Losses.

It is believed, says the *Times*, that the abnormally hot summer, which has dried up everything both in and out of doors, has had much to do with increasing the loss ratio from fire. Certainly, the London Fire Brigade and the Salvage Corps have been kept exceedingly busy within the past few weeks during which the heat was intense, and in addition to their ordinary cares have been added the anxieties caused by the series of strikes throughout the country. One British company alone has been concerned with conflagrations costing nearly a million and a half sterling.

The Teaching of Discipline.

In opening a new elementary school and housewifery centre at Seaforth, near Liverpool, Professor R. J. Harvey Gibson, M.A., expressed the view that it is of the first importance that a school should teach discipline; let it try to make the scholars remember they were members of a great nation. Events had shown them what a state of things could be brought about because one section of the body politic refused to do their duty. Could they not get over such a difficulty in the future by teaching the children who might become transport workers the value of discipline? Let them have their grievances, but do not allow them to upset the whole country until those grievances were settled. The whole of society depended upon the work of each member. The lesson this strike had taught was that the schools must not only teach the very simple problems of education, but something more—the spirit of obedience to the municipality and the country to which we belonged. There was far too much individuality in these days. What was wanted was more discipline and

patriotism. They might make more of the phenomena of the subjects of the day, and a little less of the wives of Henry VIII.

Swimming-Baths on the Lines of the Amphitheatre.

The principle of surrounding the swimming-bath with a series of tiers before reaching the dressing-boxes is growing in popularity, and the Keighley Town Council has recently decided to adopt this method in the new bath they propose to erect. The demands of swimming competitions necessitates the retention of the recognised oblong form of bath, but the provision of a series of raised steps between the bath and the dressing-boxes has obvious advantages in keeping the latter out of range of wet, from splashing, and in providing for spectators of the water sports, and also when the bath is used, as is frequently the case, for other purposes of entertainment.

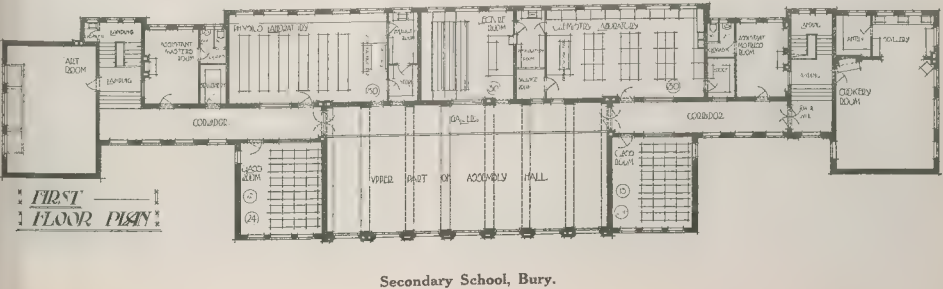

Improvements in Aberdeen.

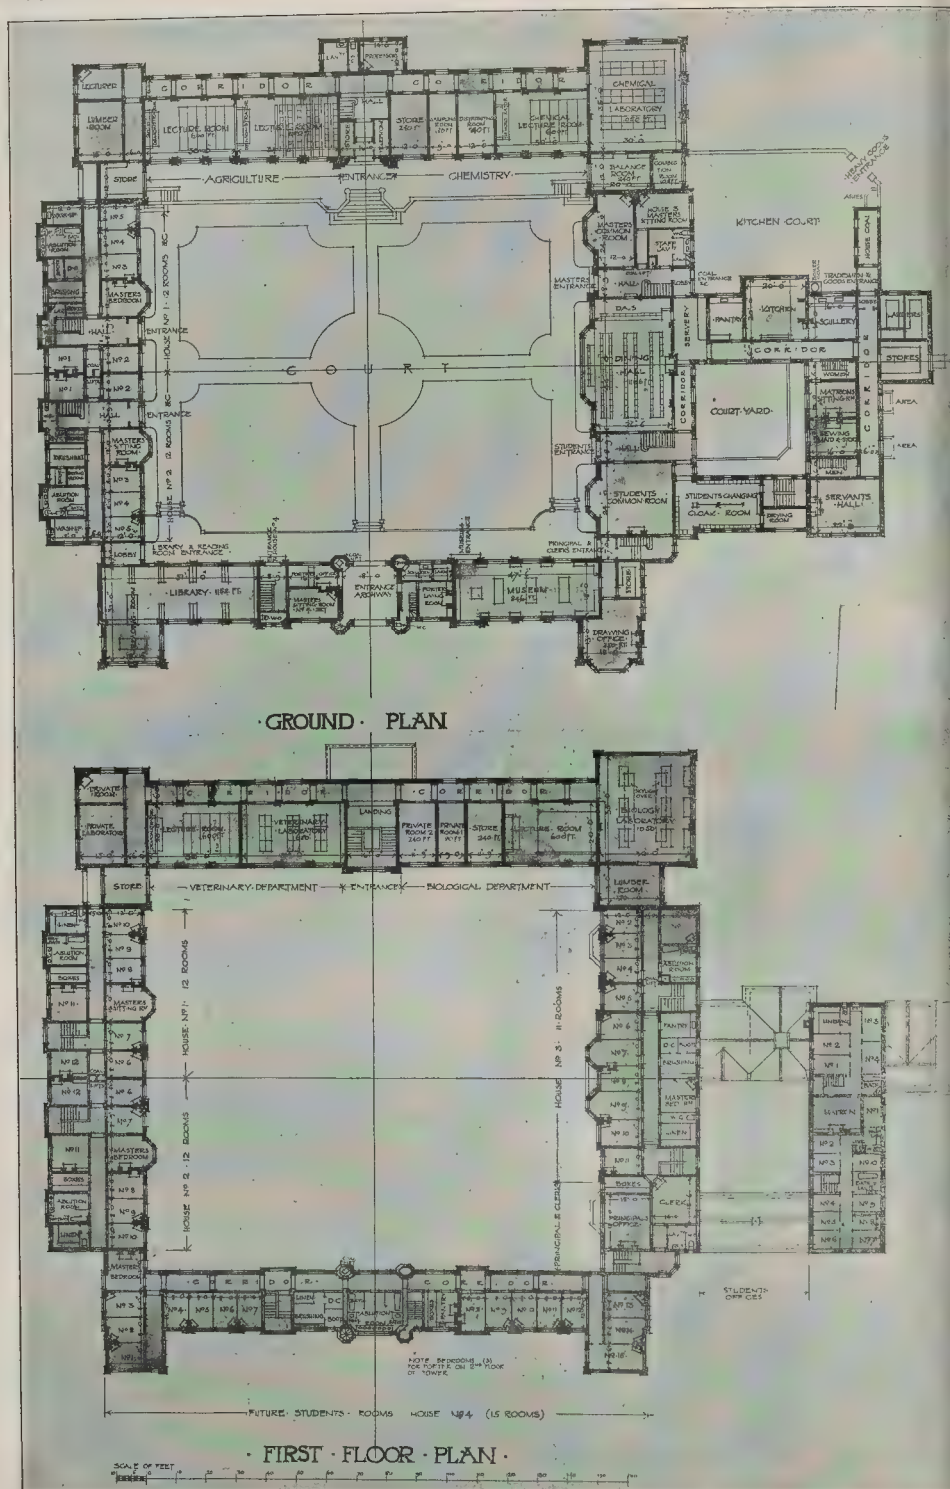

The Aberdeen Town Council are considering the possibility of clearing Blackfriars-street and forming a new thoroughfare. The cost would be about 40,000*l.* If the scheme were adopted, the present architectural features would be improved and important new buildings would be erected.

COMPETITION NEWS.

Seale-Hayne College, Newton Abbot.

Thirty-five sets of plans were submitted in this competition, and, as briefly noted in our issue of July 21, the assessor, Mr. Charles Steward Smith, F.R.I.B.A., of Reading, placed the following first, second, and third respectively:—
First premium, of 100*l.* Messrs. A. F. & R. F. Gutteridge, A.R.I.B.A., Southampton.

Seale-Hayne College, Newton Abbot. Accepted Design.
By Messrs. A. F. & R. F. Gutteridge, A.R.I.B.A.

Second premium, of 50l.—Mr. Josias Beare, A.R.I.B.A., Newton Abbot.

Third premium, of 30l.—Messrs. Crouch, Butler, & Savage, Birmingham.

The plans and elevations submitted by Messrs. Gutteridge are published in this issue. It is proposed that the entire scheme shall ultimately cost about 30,000l., and that the first instalment shall cost about 20,000l. The block on the south side of the "Quadrant," together with some parts of the servants' quarters, etc., will therefore for the present be omitted, but the present buildings will include headmaster's house, dairy, smiths' and carpenters' shops, and electric light station. A detached gymnasium will form part of the future addition. It is proposed to erect the buildings in red bricks, with stone dressings, and slated roofs. The site is a very fine one, on high ground about two miles west of Newton Abbot, and the college buildings will command a view of the Teign Valley and the open sea beyond.

The completed scheme will ultimately include a set of farm buildings with labourers' cottages, the Governors owning some 230 acres around the College buildings.

Welsh National Eisteddfod.

At the Welsh National Eisteddfod recently held at Carmarthen the following were the awards in architecture:—

For the best design, with specification, for a cottage to cost 180l.—Mr. Wm. Eaton, A.R.I.B.A., Cardiff.

For the best design for a public hall to seat 500 persons.—Mr. Dan. W. Thomas, Derby.

For the best sketch in black and white of any building of antiquarian interest in Wales.—Mr. Wm. Eaton, A.R.I.B.A., Cardiff.
Mr. Edwin Seward, F.R.I.B.A., of Cardiff, was the assessor.

An Ideal House.

Messrs. Reginald C. Fry & H. Clarke, jun., of 12, Clifford's Inn, Fleet-street, have been awarded the first premium, of 100l. in connexion with the competition promoted by the *Daily Mail* for an ideal country house to cost from 900l.-1,000l. Messrs. E. C. P. Monson, F.R.I.B.A., & E. J. Sadgrove, F.R.I.B.A., with others, were the assessors.

BOOKS.

The Housing of the Working Classes Acts, 1890-1900, and Town Planning, Annotated and Explained, together with the Statutory Rules and Forms. By CHARLES E. ALLAN, M.A., LL.B., Barrister-at-Law, assisted as to the practice by FRANCIS J. ALLAN, M.D., D.P.H. Third edition. (London: Butterworth & Co.; Shaw & Sons. 1911.)

This third edition of this work forms practically a new treatise, for, as is explained in the Preface, since the last edition appeared both the Housing of the Working Classes Act, 1903, and the Housing and Town Planning Act, 1909, have come into force. The work seems designed on practical lines, as the text consists of the various Acts dealing with housing, with copious notes to the sections of the Acts, and forms a complete handbook to this unfortunately complicated subject. There are, besides an introduction, tables of

statutes and cases, and an index, but the provisions of the Acts relating exclusively to Ireland are omitted to save complexity.

The work appears to us to have been carefully carried out, and is likely to prove a useful guide to those who have to master the legislation on the subject, which is typical of modern legislation in its intricacy. The Act of 1890 was a codifying statute intended to consolidate the law, but such amendments and new matter have been introduced by the subsequent statutes that it may be questioned whether the Act of 1909 should not have been a codifying statute on the question of housing of the working classes, and the town planning portion of the Act been introduced, as the authors suggest, as a separate statute. The case *Rayner v. Mayor, etc.*, of Stepney (noted the *Builder*, July 7 last) was decided since the issue of this volume, but is an important decision on the form of closing orders.

Butterworth's Workmen's Compensation Cases. Vol. III. (New Series). Edited by His Honour Judge RUGGER, K.C., and DOUGLAS KNOCKER, Barrister-at-Law. (London: Butterworth & Co. 1910. Pp. 596. 7s. 6d. net.)

THE period covered by the third volume of "Butterworth's Workmen's Compensation Cases" is from October, 1909, to October, 1910, and in the Preface we see it stated that during that period 142 cases were set down for hearing, ninety-seven of which were tried out, from which it appears that the Act of 1906 has by no means put an end to this class of litigation. These Reports, which are a continuation of those started by the late Mr. Minton Senhouse shortly after the original Act came into force, are so well established, and have proved of such utility both to the legal profession and to the public, that they require no commendation at the hands of the reviewer, and the only matter open to consideration is the form in which they are presented. We notice that in this third volume the County Court cases are omitted, and in this we think the editors have shown a wise discretion, as these decisions are of little authority. Another point on which, from the remarks in the Preface, the editors appear to be in some doubt is whether they are wise in including cases which turn solely on questions of fact, and we have suggested before that these cases might be confined to the quarterly advance sheets, and not be included in the final volumes. A new feature in this volume is a record of every case entered in the House of Lords, whether it proceeded to judgment or not; but, if space be valuable, we do not think much is gained by this. As regards the arrangement of the cases, in former volumes of this series we think the cases followed the sections of the Act; in the present volume this plan seems not to have been adhered to, nor are the cases placed in alphabetical order, but they are grouped according to the law terms during which they were heard. We venture to suggest that the former arrangement was the most convenient. The table of cases includes the cases reported in all the volumes of both series, but in this volume the index to former volumes has been omitted, the index being confined to cases only reported in this

volume. This, again, appears not to be a change for the better. We make these suggestions and comments in no disparaging spirit; but in our review of Vol. II. we observed, "We can see no room for improvement in the arrangement of the present volume," and we still think a counsel of perfection had been attained.

A Digest of the Law of Easements. By L. C. INNES, late of the Indian Civil Service, and sometime one of the Judges of Her Majesty's High Court of Judicature, Madras, and sometimes Fellow and Vice-Chancellor of the University of Madras. Eighth Edition, by NOEL LETBOURNE GORDARD, of the Middle Temple, Barrister-at-Law. (London: Stevens & Sons. 1911. Pp. 142. 7s. 6d.)

THE first edition of this little work was published in Madras in 1873, and in the present edition Mr. Gordard, as he explains in his Preface has followed the plan of the author in his earlier editions, but has brought the work up to date, and also entirely recast the index. The digest form—the enunciation of general principles and propositions printed in large type with illustrations printed beneath in smaller type—is very useful to those desiring to attain a general knowledge of a particular branch of law, although more amplified textbooks are required by practitioners. The fact that this is the eighth edition of this little work shows that it has been appreciated in the past, and since the present editor is joint author of a well-known treatise on the law of easements it can safely be assumed that this latest edition will prove as useful as its predecessors.

The Inventor's Adviser and Manufacturer's Handbook to Patents, Designs, and Trade Marks. By REGINALD HADDAN, Fellow of the Chartered Institute of Patent Agents. Eighth Edition. (London: Harrison & Sons. 1911. Pp. 494.)

WHEN it is stated that the first edition of this work appeared in 1894 and that this, the eighth edition, is dated December, 1910, in a sense the reviewer's task may be said to have been accomplished on the principle *res ipsa loquitur*. Quoting from the title-page, we may, however, remind our readers that this volume is intended as "an instructional guide to the commercial development of inventions, their protection by patents at home and abroad, and the valuation and disposal of patent rights." It also includes requirements for registration of designs and trade marks, and particulars of the patent law and practice of foreign countries and the colonies. The work, as its title implies, is more a handbook for the inventor than a text-book dealing with the strictly legal aspect of the subject. As regards the much-discussed section of the Act of 1907 respecting the revocation of patents when the patented article or process is not adequately manufactured or carried on within the United Kingdom, we note that the author disapproves of the principle involved, and says that in his opinion the whole section were best repealed; but this branch of the subject occupies but two pages of the work. No doubt this edition will be as useful as those that have preceded it.

· SOUTH · ELEVATION ·

Seale-Hayne College, Newton Abbot. Accepted Design.
By Messrs. A. F. & R. F. Gutteridge, A.R.I.B.A.

EDITORIAL SUMMARY.

The editorial article—entitled "Modern Ships and the Architect"—deals with the development of the ocean "liner" as it affects the architect in his capacity of decorator.

Notes (p. 237) include: "The Trade Union Congress"; "General Strikes"; "Unventilated Bedrooms"; "Sanatoria and Dispensaries for the Tuberculous"; "A Master of Arts and Crafts."

"The Story of the Bridge" is continued on p. 237, examples in illustration being chosen from the Middle Ages. Bridges with chapels were numerous in Medieval England, while gateways and towers for defence were often added.

A continued notice of the visit of the Architectural Association to France is given on p. 239. Among the places mentioned are Looches, Villandry, Azay-le-Rideau, Langeais, Lunays, Saumur, and Fontevault.

On pp. 242 and 243 illustrations are given of the new Secondary School, Bury, designed by Mr. J. T. Halliday, A.R.I.B.A.

Under Competition News (p. 243) references are made to the Seale-Hayne College, Newton Abbot, and to the Welsh National Eisteddfod.

The books reviewed are "The Housing of the Working Classes Act," "Butterworth's Compensation Cases," "A Digest of the Law of Easements," "The Inventor's Adviser" (p. 245).

Correspondence includes letters from Mr. J. A. Randolph *re* "Bruges"; Mr. E. R. Robson *re* "School Playgrounds"; Mr. Edward Vale *re* "Architects and Shop Design"; and one *re* "Salaries of Architects' Assistants" (p. 246).

In the illustrated Monthly Review of Civic Design (p. 247) will be found a review of Mr. T. H. Mawson's "Civic Art"; an article on "The Growth of a Town" (p. 249); an example of the planning of a seaside suburb (p. 250); and Notes.

The Building Trade Section includes an illustrated article on "Building Plant in Pretoria" (p. 252); "General Building News" (p. 253); and a list of "Projected New Buildings in the Provinces" (p. 254).

In the Legal Column (p. 256) reference is made to the distinction between a sewer and a natural watercourse.

Hutcheson's Girls' Grammar School, Glasgow, is described on p. 255; and on p. 257 is a note on the funds of the Road Board.

MEETING.

FRIDAY, SEPTEMBER 8.

Institution of Municipal Engineers of London, Victoria, 9.45. London Bridge, 9.50. Phoenix Ironworks, 11.0. At 8.10 leave for Seaford, where Air Compressing Station, Ejectors, and Refuse Destructor House, under construction, will be shown.

CORRESPONDENCE.

A Restoration en Règle!

Sir,—As appeared from the leading article of the *Builder* last week, and from an article a year or two ago about "Gheeraertising Bruges," in another architectural paper, a number of questionable restorations have been perpetrated in that city, and also, alas, in other parts of Belgium, such as Fermonde, where the splendid Renaissance gable on one side of the Town Hall's belfry has given place to a poor modern Gothic one, to match, if possible, a corresponding plain old Gothic one on the other side of the tower! But a welcome and interesting work is in progress at Ghent, where the restorer has already done good work during the last few years.

An International Exhibition is to be held there in 1913, and visitors who know the city will be agreeably surprised to find that the hideous armour-plated excrescence on the top of the belfry has been replaced by a lighter affair in masonry, more in keeping with Flemish architecture of the period of the tower, and not unlike the celebrated one at Ypres. This will enable the blocked-up windows in the body of the tower to be reopened and filled

with tracery, they having been filled in when the monstrous extinguisher was put on. A good many years ago we remember seeing, in the late Mr. De Potter's "History of Ghent," a print of the belfry as it used to be; but, as far as memory serves us, the new top will not be a reproduction of the mediæval one, which is a pity. One weak point in the adopted design is the traceried window behind each clock dial. It would have been more effective to have put twin windows, and not to have the "top" exactly octagonal, and the dial sides longer, the shorter ones being behind the corner turrets. The design is decidedly "thin" as regards that part.

We fancy the architect has a fondness for the tower of the Town Hall at St. Nicholas (Waes)—probably one of the best things from the pencil of a pupil of the St. Luke's School at Ghent. That school of Gothic architecture is slowly getting out of its original groove of monotonous mouldings and capitals and unoriginal and unvarying window-tracery design. Unfortunately, it still holds grimly to grey-wash on stone columns of restored church interiors, with black or white bands of $\frac{1}{4}$ in. or more in imitation of masonry joints, and to the fearful and wonderful mural decoration it introduced, justifying the rather abusive criticism in a non-Catholic local guide-book of an over-decorated chapel near the school as "une véritable bon-bonnière monacale!"

But, as the State has a voice in the belfry restoration, we hope to see detail more in accordance with the mediæval tradition than is to be found in the wearisomely monotonous detail as restored by the school in question, as at Audenaere (Benedictine), Tournai, Ghent (St. Jacques' interior), and elsewhere roundabout.

Even if the school varied its detail design, mouldings, window tracery, etc., it could never hope to produce a Truro Cathedral. In wood-carving and metalwork its pupils are, however, unapproachable, and in the matter of stone altars and statues they are much better than they used to be, though the features of the Saints represented are too sentimental and lacking in variety, the same remark applying to figures in their too transparent stained-glass windows.

We ought to see a Gothic school mediæval in its works, and not modern Gothic.

JOHN A. RANDOLPH.

The Architect's Assistant.

Sir,—I have been interested in reading "A Lesson of the Strike" in your valuable paper of last week's date, and with reference to your remarks, as to the "increase of charges" being laid upon the shoulders of the "manufacturer and trader," does the burden "rest" there? I think not; for these persons in turn hand it down by way of increased charges to the actual consumers or final purchasers—"the general public" (with interest). Thus we shall find the cost of living considerably increased.

This increased cost of living will not greatly affect the "master man" or the fairly "well-to-do," but the "poorer classes," among whom are not only included the "labourers," but also all classes of "clerks" employed in small houses of business, estate agents, and also architects' assistants, among the last two classes of whom will perhaps be found the worst or almost the worst paid of all.

I venture to suggest that, if inquiries were made it would be found that the "greater proportion" of architects' assistants (with whom your readers will be mostly interested) receive salaries averaging lower than that of "builders' labourers" (among whom, you state in your issue of the 18th ult., a strike is threatened for increased pay), or if not actually lower, then very little in excess of the "labourer"—this in spite of the fact that in very many cases substantial sums have been paid as premiums and low wages accepted for years to secure a knowledge of their profession, only to find at the end of it all that a "salaried berth" is practically impossible to obtain.

Surely, sir, the day has come when, among others, the lot of the clerk and the architects' assistants should be considered, and salaries paid in accordance with the skill necessary, and the apparent position they are expected to keep up.

AN ARCHITECT'S ASSISTANT.

Bournemouth.

School Playgrounds.

Sir, Adverting to your admirable "Note" in your issue of Aug. 18 on this subject, may I be permitted to say that the rule as to a minimum area of 30 ft. per child has never been regarded as "rigid," but rather as a suggestion to be followed under ordinary circumstances, and to be relaxed according to the facts of each case?

Also that it has never been held to apply to other than elementary schools, where the playground has been well called the "uncovered schoolroom."

I doubt whether half the elementary schools in London have playgrounds of 30 ft. per head.

A grammar school or a girls' high school needs much more space, where tennis, cricket, football, and other games are now regarded as indispensable.

E. R. ROBSON.

Architects and Shop Design.

Sir,—In the issue of the *Builder*, August 11, a Singapore architect suggested a masonry arch and piers for shops fronts, with showcases set back 6 ft. to 8 ft. from the arch, forming a kind of arcade. The arch and piers would be welcomed not only by the majority of leading shopkeepers, but also the shop-front specialists; as for setting back the plate glass 6 ft. or 8 ft. from the front, 90 per cent. of the writer's clients have never been able to keep the glass far enough out into the street, not to consider the waste of valuable space and the dark shades, an example of which we have in the Rows at Chester.

FIFTY YEARS AGO.

From the *Builder* of August 31, 1861.

Emigration of Spitalfields Weavers.

WE are glad to perceive that the emigration movement amongst the Spitalfields weavers has been commenced with some success; and by this time a number of families are on their way to Queensland, a place of promise.

NEW BUILDINGS IN LONDON.

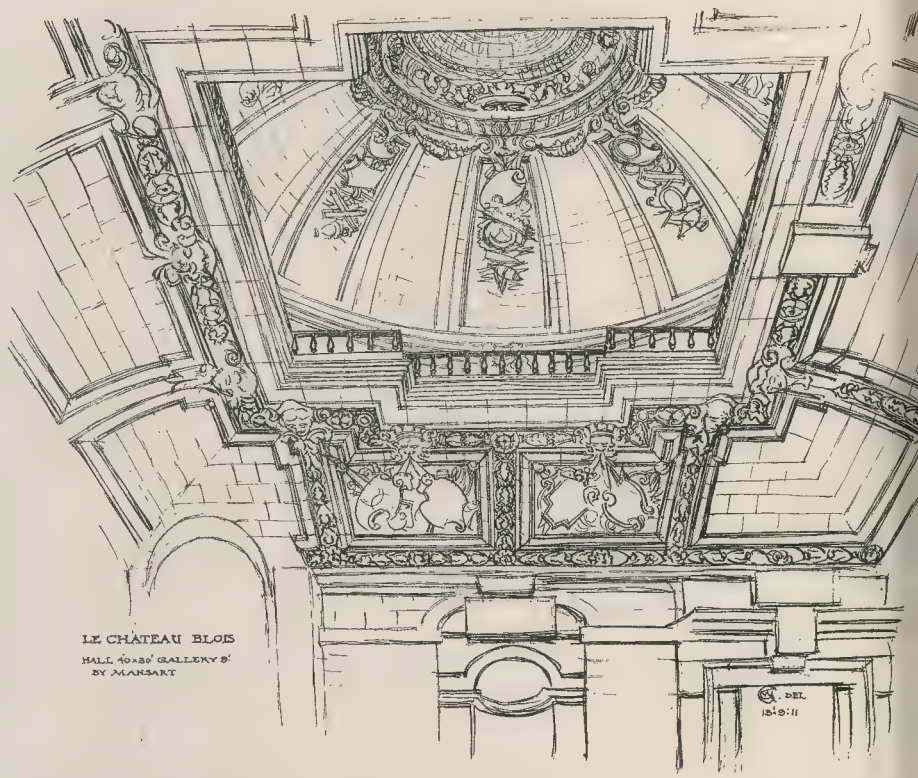

Block of residences, Park street and Upper Grosvenor street, W.; Mr. W. Willett, builder, Sloane square, S.W. Extensive buildings, Shaftesbury-avenue, W.C.; Mr. Bertie (revue architect, 75-7, Shaftesbury-avenue, W.O.; Messrs. J. Parkinson & Son, Ltd., builders, Blackpool.

GIRVAN, Ayrshire.

The Town Hall, Girvan, which has been completed recently from the designs of Mr. W. J. Jennings, of Canterbury, was opened formally a few days ago. Mr. John M'Master, the generous donor of the building, was given the freedom of the Burgh, and his bust, by Mr. John Tweed, was unveiled. The M'Master Hall, as it will be called, was built of Giffnock stone, the cost being about 20,000l. The contractors were:—Mason work, Messrs. Train & Taylor, Rutherglen; plumber work, Messrs. Steel & Wilson, Glasgow; slater, Mr. James Scott, Rutherglen; joiner, Mr. George Eaglesham, Govan; plasterer, Mr. W. A. Vass, Ayr; clerk of works, Mr. E. J. Norman.

MONTHLY REVIEW *of* CIVIC DESIGN.

Church at Messina.

From Mr. Mawson's "Civic Art." (Mr. B. T. Batsford.)

THE LATEST "CIVIC ART."*

FOR a busy professional man to achieve a standard work in an important subject demands to an exceptional degree the faculty of abstraction from the details of practice and concentration on the systematic handling of the materials to be dealt with. It can hardly be said that Mr. Mawson in his book on Civic Art has shown he possesses this faculty. The sub-title, "Studies in Town Planning, Parks, Boulevards, and Open Spaces," very nicely represents the matters covered in the book, but when one takes up a work so monumental in its proportions entitled "Civic Art," the natural anticipation is that it will exhibit a comprehensive and logical exposition of the whole subject. This can hardly be claimed; indeed we do not gather that Mr. Mawson has intended to deal with his subject in this fashion, rather preferring to take up and develop those factors in which he felt an especial interest, and to ignore the rest, passing hurriedly over others of equal importance.

As a result, we find that, though his book contains a mass of interesting material and some valuable studies in tried aspects of civic design, there is a feeling of incompleteness and of a lack of cohesion if we consider it as a philosophic

study of the subject as a whole. This may be in part due to the arrangement the author has adopted. Surely architecture and the kindred arts are primarily based on the expression of material necessities, and the first essential in an exposition of Civic Art is to define the practical and ideal requirements on which it is founded. Though Mr. Mawson seems to possess a fund of information on such points, it appears only in scattered paragraphs throughout his work. Possibly he feared to frighten his readers by digging too deeply into these at the start, and consequently he leads off with four chapters on "The Theory of Civic Art," which, despite the numerous sound points made in them, would be the despair of any scientific student in the way they ramble from one aspect to another, and the erratic arrangement of the materials of which they are composed. In these chapters the issues are often confused rather than clarified by the numerous analogies and illustrative passages they contain.

In the succeeding chapters on "The Practice of Civic Art," Mr. Mawson is on safer ground. His valuable experience in this work entitles his views to respectful consideration; but even here he seems impatiently to skip over the first basic principles in his hurry to reach his extensive selection of concrete examples. Of what use to the

student is an example except as an illustration of a principle? And throughout this work we find the space devoted to views and examples somewhat disproportionate to that given to hard reasoning on the principles these illustrations should illumine. We must admit that the illustrations selected and the way they are reproduced deserve very high praise, and they will go far towards making the book a popular one; it is from the student's standpoint that we feel the work is not quite what it might have been. There is a fluent easiness in the writing that carries the reader on until he feels that somehow or other he has been carried past the point at which he should have been pulled up, and compelled to think out the meaning of the matter in hand. Thus the fifth chapter opens with a summary of the preliminaries to putting in operation a town planning scheme, and goes on to tabulate the primary desiderata of paramount importance. These are given as circulation and transit, hygiene and beauty. This, even with the explanatory notes that follow, is, to say the least, a very inadequate schedule, and in the course of a dozen lines we are carried on to such details as subways, tramlines, etc. Surely housing requirements and manufacturing methods, for example, exercise as much influence on the appearance of a city as the provision for transit which Mr. Mawson

claims as representing two-thirds of the anatomy of the subject; while political and social factors can hardly be entirely disregarded.

The chapter on Street Equipment seems to suffer from a confusion in the ideal aimed at, and it would have been well to have included here some notes on the artificial lighting of streets—a matter in urgent need of study at the present time. In the following chapter on Boulevards, etc., Mr. Mawson is on his own ground, and the hints he offers deserve the most careful study.

Both this and the succeeding chapters contain much of indubitable value, and our only regret is that other branches of the subject have not been handled with the same thoroughness. We could have spared some of the examples of the treatment of comparatively unimportant problems if by that means room could have been found for the fuller rendering of the principles which must be mastered by all who aspire to success in Civic Design.

Mr. Mawson's motto may be "Example is better than precept," but the publication of a multitude of examples is not the most efficient way of imparting instruction in any art, and least of all in one so complex as that of Civic Design.

THE GROWTH OF A TOWN.

WE extract the following from a lecture on "Town Planning," by Mr. A. R. Jemmett, F.R.I.B.A., being one of a course of six delivered at the London County Council Westminster Technical Institute:—

"To endeavour to trace the growth of a town from a primitive collection of huts to its present highly-organised state it would be necessary to trace the rise and progress of civilisation in general, and the social life of towns in particular, and to show at every point how this growth expressed itself in its arrangements. This is obviously beyond the scope of these lectures.

On the historical side of the subject there is a very wide field of inquiry open to those who may have a taste for historical research.

Before we can obtain the full advantage of the study of existing towns, it seems necessary to realise that we cannot consider them as isolated and complete designs in themselves independent of the arrangement of the surrounding country and of the existence of other towns. We must also realise what town planning is from what may be called the outside point of view, and see how it fits in with the general scheme of things.

We have seen that it is the art of arranging a town to serve the needs of its inhabitants, and from this point of view it seems a complete subject in itself. Really, however, it is part of a larger subject—the art of planning.

The art of planning is the art of arrangement. To plan is to contrive to scheme to arrange anything that is capable of arrangement—not necessarily towns.

The whole scheme of ordered civilised existence is a plan of which town planning is a part. It is the outcome of, and it depends upon, the plans of the statesmen or the social organisers who created the laws and customs of the civic life which is expressed in our plans. The connexion between the two is intimate and close, and we cannot consider one without the other.

That aspect of planning which most concerns us is the one that deals with the arrangement of the surface of the earth and the buildings upon it in accordance with the needs of those who occupy it, but always in conformity with the political or social plans that gave rise to those needs. So that the whole of our subject is only a part of the plan of civilisation.

Most plans, however complete they may seem in themselves, are only part of a larger plan, and are themselves made up of smaller ones. The plan of the city, composed of a collection of the plans of individual buildings, themselves a collection of plans of separate rooms, is but a part of the plan of the whole country, itself a part of the plan of the surface of the earth, which, after all, is but a point in the general plan of the universe.

The planning of a town, then, comes midway between larger and smaller plans—the planning of a building and the planning of a district—and it is not quite easy to say where one begins and the other ends, to dissociate the planning of the town from that of the country immediately dependent on it, which in turn affects the arrangement of the town. The art of planning is the same in both cases. The same skill that plans a town plans a house. It is the same art that groups the cottages and farms into hamlets and villages that governs the position and arrangement of market towns and cities, and plans the lines of communication between them. Planning is the art that arranges the whole surface of the earth to render it fit for human habitation; our branch of it is concerned with the arrangement of buildings in relation to one another, not so much planning the buildings themselves as planning the spaces between them.

If we look back to the beginning of things and consider all we know of nature's plan for the arrangement of the surface of the earth, we see a gradual development from a state of chaos in which no animal life was possible up to its present condition, a development in which each form of life appeared as the conditions became suitable for its existence; but we find no attempt on the part of nature to do more than provide an environment within which it was possible for such life to exist and develop of its own initiative. Each form of animal life had to arrange this environment for itself in accordance with its own needs in order to support existence. The higher the form of life the more arrangement was necessary. When we come to the arrangement that man has found necessary to his physical, mental, and spiritual needs, we arrive at planning as a fine art.

Considered from this point of view, then, planning is the oldest of the arts. Its first practitioners were the animals. They arranged the surface of the earth to suit their own needs, till they covered it with a network of paths, which, following the lines of least resistance, would be determined by the natural formation of the ground, the lay-out of hills, rivers, and swamps, through which

they would discover by degrees the easiest and safest way.

These paths would be used by primitive man as we see them used to-day in primitive or undeveloped countries. The more important of them being recognised as the easiest lines of communication would—as in the case of Portage-avenue, Winnipeg—in the course of time, become roads, and so determine the position of primitive settlements, which later on grew into towns.

The majority of inland towns having sprung up at cross roads or the intersection of main lines of communication, and their ultimate growth and prosperity having, before the days of railroads, been largely dependent on these natural lines of communication, it seems impossible to understand the growth of any town or the nature of its trade without taking this into consideration and studying the town as part of the whole district.

The historical aspect of town planning seems to divide itself naturally into two parts, the social and the geographical—the human being, with his desires and needs, and his environment, the physical formation of the earth he lives on—social progress as affected by geographical conditions. The two things are really inseparable, and must be studied together.

When we come to consider the life of the inhabitants of the primitive towns, whose position was so often dictated by geographical

considerations, we find a rude state of society, an incomplete social organism; in fact, a mere rudimentary beginning of a completely organised corporate life. This lack of organisation we find expressed in their plans, which show a total absence of any attempt at unity of conception. The civic life being little better than a fortuitous aggregation of individual units, the plan is little better than an accidental collection of houses. Each house is designed separately, with no regard for its neighbours or for the general welfare; the streets receive no consideration, and are just that part of the area of the town which does not happen to have been built on. The houses are the result of deliberate design, the streets the result of accident—just the space left over.

Civic life being so elementary, the individuals had hardly yet begun to see the advantage of surrendering their personal rights for the common good—the individual life was not yet merged in the corporate life. Everyone was fighting simply for his own hand.

The plan, then, with its houses of all sizes and shapes, and its streets of no shape at all might be considered a most interesting expression of the various individuals comprising the population. The position and relative sizes of the houses might give a very fair idea of the strength, greed, and cunning of the various original owners, but the only idea

it gives of the corporate civic life is that such life did not exist except in the most primitive form for the sake of mutual protection, as illustrated by the walls or other means of defence, which suggest combination and not individual effort.

Town planning being the art of arranging or designing the position of, and the space between, buildings, the moment two buildings are placed sufficiently near to one another to influence each other town planning begins. In this rudimentary state it may perhaps be traced in the streets of these primitive towns as each individual desires to obtain access to his house (so making the street necessary) might be supposed to carry with it so recognition of the same desire on the part of others, so leading to a common agreement to the streets. It seems, however, to attain to the dignity of a complete art at the moment in the history of the development of the civic life of the town when the sense of a corporate life is first realised, when the corporate life awakes and becomes self-conscious and asserts its predominance over the life of the individual. This may be traced in a plan at the moment when the arrangement of the streets—the public places—obtains precedence over the arrangement of the houses—the private places.

But when this moment of the awakening of the corporate life arrives, the town already built, and it is too late for the

THE BUILDING TRADE.

BUILDING PLANT IN PRETORIA.

By H. BRILL-JOHN, F.S.I., A.M.S.E.

THE average architect takes little thought of the plant used on his buildings. He trusts to the contractor, for his own sake, to use the plant necessary for the work, and, as far as estimating the value of it goes, the architect, if the contract provides for it, generally allows in his certificates an amount based more or less on the contractor's suggestions. The description of plant used must necessarily depend on the construction of the building concerned, and on whether the materials can be worked before delivery on the site or whether the chief part of the labour is actually done on the premises. Stone may be worked at the quarry or altogether on the site. The contractor may, if circumstances warrant, elect to have all his joinery prepared on the site of the building to be erected, he may make it in his own shops, or he may purchase it from a "steam joinery works." The conditions in the "Old Country" are more or less stable, and the outcome of long development. In the colonies it is somewhat different; and necessarily circumstances differ in each colony. What Canada may find easy South Africa may find difficult to accomplish, and what may be a perfectly simple matter in South Africa may be rendered very difficult in Canada or Australia, owing to variety of labour conditions and other causes.

Even in South Africa "the coast" and "up country" are two very distinct zones, the long railway journey from the coast to the interior rendering materials and labour on the whole very much more expensive in the latter than at the former. When, therefore, labour conditions in South Africa are referred to, it is necessary to bear these facts in mind. In these notes Pretoria alone is dealt with. It is also intended to deal not with questions of labour and plant in Pretoria in general, but only with reference to some of the larger public buildings now in course of erection under the supervision of the Public

Works Department of the Union of South Africa.

A royal visitor from overseas not long ago was good enough to air his views locally as to the building plant in Pretoria, much to the disgust of the building contractors thereof. Visitors from overseas are such candid, quick-learning, and even omniscient fellows that they see through the poor colonial in a trice and know more of local conditions in a fortnight's stay than the ordinary local man gets to know in a busy lifetime. I propose giving my facts under the heads of the several contracts.

Union Government Buildings.

The new Government buildings for accommodating the head offices of the Union Departments naturally take first place. The architect is Mr. Herbert Baker, who has conceived the scheme in a bold spirit. An excellent description of the buildings may be read in a paper read before the South African Association for the Advancement of Science not long ago by Mr. Lucas, of Pretoria. The work is being carried out under two contracts, the extensive site work being executed departmentally.

The larger contract is held by Mr. M. C. A. Meischke, the amount being 622,500*l.*, and the time given for completion thirty-six months. This contract embraces the western and eastern blocks, which are more or less duplicates. The building being stone-faced throughout, with a large amount of reinforced concrete in floors, etc., necessarily decides the character of the machinery and plant used. In June the basements were partly in and the ground floors begun. There are fifty-two cranes of various kinds on the works, including two 5-ton steam cranes, three 5-ton electric, four 3-ton electric, one 3-ton steam-travelling crane, and forty-two hand cranes of powers varying from 15 cwt. to 5 tons.

The site being halfway up a steep hill (Meintjes Kop) overlooking Pretoria, it will be understood that a considerable amount of traction or hauling plant is required. There are two steam-hoisting engines, and thirty-five electric motors for driving machinery aggregating 550-horse-power.

The large amount of concrete used necessitates the use of two stone-breakers and concrete "batch" mixers. There is a mortar-mixer and a ball mill. For work on stone there are four planing machines, two swing saws, two diamond saws, and two tinning lathes. There are also a metal-turning lathe, two metal-drilling machines, and woodworking machines of various kinds. There are blacksmiths' forges, sheds for machines, men, materials, natives' quarters, scaffolding, etc., bringing the total value of plant up to about 33,500*l.*—no small item for consideration in entering into a contract of this kind.

The second contract, that for the main theatre or central block, is held by Messrs. Prentice & Mackie, and amounts to 256,200*l.*, the time for completion being thirty months. It will be understood that the plant required is not so extensive as in the previous referred-to contract, but no small outlay is involved. The approximate value of plant in use is over 18,000*l.*, and its character is more or less similar to that used by Messrs. Meischke, a large amount of tram track trucks being required, temporary build and other general items costing fairly large sums. Scaffolding and centring for floors valued at 2,500*l.*, electric wiring at 575*l.*; rendering necessitated an expenditure of 420*l.* this firm alone for their own purposes; a water service cost 430*l.* Of cranes there are 5-ton, one 4 ton, three 3-ton electric, one 5-ton steam, twenty-six hand cranes hoisting from 1 to 7 tons, an overhead crane, one steam two electric hoists. There are two steam crushers and engines, two stone-planing machines, two stone saws, and two tinning lathes, the three last items costing about 1,750*l.* There is an electrically-worked concrete-mixer worth 275*l.*, and woodwork machinery valued at over 300*l.* Electric motors, plumbers' and blacksmiths' out of an iron saw, and various smaller items help swell the total value. The machinery at contractors' workshops near the centre of town is valued at over 1,000*l.*, and includes two electric motors aggregating 36-horse-power, band, circular, and cross-cut

New Museum and Library, Pretoria: Showing 5-ton Cranes, 75-ft. and 80-ft. Jibs.

New Museum and Library, Pretoria: Laying Reinforced Concrete Floors.

drilling machine, shaping machine, and usual woodworking, planing, and moulding machines.

New Railway Station.

the existing railway station at Pretoria is a very poor affair, but the new building will be worthy of the administrative capital of the Union. The European portion is partially completed, while the Kafir station, on the site of the present buildings, will not be begun until the European portion is completed. Messrs. Prentice & Mackie are the contractors, their price being 91,284l. 6s., and the work for erection eighteen months. The architect is Mr. Herbert Baker.

The fronts are all of Orange Free State stone, and all floors are of reinforced concrete and wood. The close proximity to rail-sidings obviates the necessity of using a tram track or other hauling gear, but it is necessary, and this, with scaffolding, costing about 1,650l. Two grinders and an emery grinder cost 35l., woodworking machinery 230l., a pipe-screwing machine 75l., a pump 30l., and a concrete-mixer 150l. There are four electric motors and a stone saw and saw. Hoists and cranes are valued at 2,600l., and include twenty-one hand cranes of from 2 to 5 tons, a 5-ton steam crane, an electric crane, and 30-cwt. electric hoists. Among the smaller details may be mentioned 1,000 pulleys, and the same number of 12-ft. scaffold boards. For flooring, brick, etc., there are 3,000 super. yds. of 9-in. deal, and 48,000 ft. lineal of 4-in. The contractors' and clerk of works' office is in brick, and is valued at 1,000l. An ingenious device for bending wire reinforcement for floors was designed and used by this firm, and is found to serve its purpose admirably.

New Post Office.

the date of writing there is comparatively little plant on the works in comparison with what was used at one time, as the building is nearing completion. Readers can judge for themselves that no small outlay would be required for a contract of this nature amounting to 118,500l., and for which eighteen months was allowed. Mr. W. Nottingham, the contractor, has done most of the joinery at his Arcadia workshops, about a mile and a half from the building. The site of the Post Office (on which the old single-story building stood) is on the corner of Church-street and Church-street West. The building is faced on these fronts with freestone, and elevations are in brick, and reinforced concrete is used for floors, etc., the flat roof is covered with three layers of sheet iron.

New Museum and Library.

It is not long ago that the stranger paying his first visit to Pretoria would have been struck by the desolate appearance of the town-square and Market-street, which leads to the centre of the city. Church-square has for many years surrounded by several ancient buildings, including the Palace of the King, the Raadsaal, and the Grand Hotel. The new Post Office is now added on the west

side. Between the Church-square (from which the church which gave it its name was removed some years ago) and Station-square Market-street is poorly built for nearly the whole of its half-mile length. About midway between the squares the new Museum and Library is now being built. This structure, for which the contract price is 102,164l., is due to be completed about February, 1912, the contractor being Mr. W. R. Dey. Concrete and stone are important materials of construction, the freestone being worked on the site, as in the case of all the other buildings referred to. The hoisting of large blocks of stone weighing from 5 to 6 tons and the work involved in mixing and laying large areas of concrete flooring require the hoisting machinery to be well chosen and well placed. One interesting feature on this contract is the turning and polishing of stone columns in blocks of about 5 tons each. On the site are three 5-ton electric cranes and twelve hand cranes of various powers. The three gantries alone for the 5-ton cranes are worth about 100l. each. The stoneworking machinery includes a stone saw, planer, and lathes. There are three electric motors worth 70l. each, and a concrete-mixer with hoist and tower worth 450l. Circular and band saws, forges, rails, trucks, and sheds for workmen, materials, and natives help to run up the value of plant used. Scaffolding includes 500 poles, 10,000 ft. of 1½ in. by 9 in., and 600 pulleys. The contractor's and clerk of work's office is in brick, worth about 200l., and the total value of plant on the site is nearly 6,000l.

University College.

The old Boys' High School, used as a prison during the late war, and from which Mr. Winston Churchill escaped, is situated more or less in the town of Pretoria. A few years ago a new school for boys, with boarding-

houses, was built on the high ground opposite the Governor-General's residence in the Eastern outskirts of Pretoria. Between these two buildings, one on the top of a ridge and the other on the side of an opposite ridge, lies a wide valley—the valley in which farther west lies Pretoria proper. It is here the new University College buildings are in course of erection. There are two blocks of buildings, the arts and science blocks, the latter costing 10,000l., and the former 32,000l. The science block is completed, and is a single-story building of brick, plastered walls with stone dressings, and Marseilles tile roof. The arts block, to be completed shortly, is double-story, with Waterfall stone facings, concrete and wood floors, and Marseilles tile roofs. The nature of the construction does not require such extensive plant as the Union buildings or the other works referred to, but stone-working machinery, including saw and planer, is worth 850l., and to this must be added the value of a semi-portable steam engine. Two hundred and fifty scaffold poles, 600 pulleys, and nearly 1,000 scaffold ropes were required. Sheds for materials, workmen, and natives are always necessary, and there are eleven cranes of various powers. Water storage had to be provided, and centering for floors, etc., was worth about 320l. Mr. J. J. Kirkness, the contractor, has probably 4,000l. worth of plant on the site.

Generally.

In addition to the foregoing, it should be remembered that all these contractors have their own well-equipped workshops, and also that a large amount of haulage by traction engine and road trucks has been and is being done. The cost of engines may be anything up to 1,000l. each, and trucks are required in fairly large numbers. This item cannot be fairly set against one contract, although it may have been purchased or added to for the purpose thereof.

I have dealt with five buildings in Pretoria alone, but I hope it has been shown that this country is not lagging in the march of progress.

GENERAL BUILDING NEWS.

SCHOOL AT BEARDSDEN, NEAR GLASGOW.

Messrs. James M. Munro, F.R.I.B.A., & Son have recently completed a higher-grade school at Beardsden. The accommodation is for 750 pupils, and besides the usual instruction-rooms there is one specially equipped for art students.

ELDON PARISH CHURCH HALL.

Mr. William Davidson, of Edinburgh, is the architect of this building, the cost of which is estimated at about 1,100l.

DARTFORD.

The lease of the building used by the Dartford Urban District Council as a weights and measures office having expired, a freehold site has been acquired at a cost of 90l., and a building is to be erected by the County Architect.

New Railway Station, Pretoria: Appliance for Bending Steel Mesh Reinforcement for the Ceilings.

NEW INFIRMARY, PERTH.

On the 26th ult. the foundation-stone of the new City and County Royal Infirmary, Perth, was laid by Mrs. C. A. Murray, wife of the Chairman of Directors. The building, which is being erected from designs by Mr. James Miller, A.R.S.A., of Glasgow, is estimated to cost £6,190*l.*, and will consist of four main ward blocks, each two stories in height, with an administrative block in the centre, all of which will be connected by a corridor running the entire length of the building. Each of the main wards will contain twelve beds, and in addition a single and double bedroom on each floor. The administrative block will comprise an entrance hall, office, matron's room, sitting-rooms for visiting staff, and bedroom accommodation for resident physicians. Accommodation will be made for the nurses in the main block, the plans showing thirty-two single bedrooms, with a sitting-room and a writing-room. The kitchen and stores will be situated towards the back of the central block. On the east side will be placed the prescription and out-patients' department, while the dispensary will be so situated as to conveniently serve both the out-patients and the Infirmary proper. Quite separate from the other buildings will stand an isolation block for suspected cases. There will be two laundries, one for the use of the patients, the other for the staff.

SUNDERLAND INFIRMARY.

At the Sunderland and Durham County Eye Infirmary, Sunderland, a new operating theatre has been built. Captain Butchart superintended the whole of the new erection and alterations.

BIRKDALE.

It is proposed to erect about one hundred houses on the Birkdale Esplanade. The District Council are considering the plans.

MISSION HOUSE IN KINGSWAY.

The new building for the West London Mission, erected in Kingsway from the designs of Messrs. Gordon & Gunton, will be ready soon for occupation. A feature of the building is the roof garden or open-air orche, from which can be seen Harrow Church and the Crystal Palace.

MORRISTON, GLAMORGAN.

The six new tin-plate mills plant put down by the Beaufort Tin-plate Company will be in readiness shortly for the production of tin-plates. Messrs. W. H. Edwards & Co., of the Dyffryn Works, Morriston, have commenced operations on the mills. Excavations for the foundations, etc., have begun, and the work is entrusted to Messrs. John Aird & Co. The contract for erecting the driving machinery and boilers has been given to Messrs. Gallo-way, of Manchester.

EPPING.

Extensions, to cost 11,000*l.*, are in progress at the Epping Workhouse. The foundation-stone was laid recently by Mr. W. S. Chisen-hale Marsh, Chairman of the Guardians, who said that the scheme had been forced upon them by the Local Government Board.

TRADE NEWS.

The statutory meeting of Samuel Blow, Ltd., was held on Tuesday, 22nd ult., at the registered office of the company, 34 and 35, Upper East Smithfield, E., Mr. G. Samuel Blow in the chair.

The new schools at Hyson Green, Nottingham, have recently been fitted with D. O. Boyd's warm-air ventilating grates, supplied by Messrs. O'Brien, Thomas, & Co., Upper Thames-street, London, and Excelsior Works, South Bermondsey.

Boyle's latest patent "air-pump" ventilators have been applied to Clewer Green Schools, Windsor.

The Claybrooke Council schools are being supplied with Shorland's warm-air ventilating patent Manchester grates, by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

In the block of flats, Sylvester House, Hackney, N.E. illustrated in our issue of August 25, we should like to point out that the red facings or dressings used for this work were of Messrs. Thomas Lawrence & Sons' "W.K." machine-pressed smooth-faced facing bricks.

A new Council school is being erected at Maesmaroch for the Glamorgan County Council, under the direction of their architect, Mr. W. James Nash, A.R.I.B.A., of Neath. The Lift and Hoist Company, of Deptford, are fitting three of their folding partitions.

The George Hotel, Broadway, Hammer-smith, is approaching completion. The architects are Messrs. Nowell Parr & Kates, M.S.A., Kew Bridge-road, S.W., and the contractors Messrs. Joseph Dorey & Co., Ltd., of Brentford. Five lifts are being installed by the Lift and Hoist Company, Premier Engineering Works, Deptford, S.E.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ALFORDS.—Enlargement of Church of England school, Church-road; the Managers.

Ashey-de la Zouch.—Additions to hospital; architect, care of the Trustees of the Cottage Hospital.

Asken.—Proposed 2,500 houses for the Asken Colliery Company.

Aston (Birmingham).—Additions, Wright's premises; Messrs. A. Harrison & Cox, architects, 108, Colmore-road, Birmingham; Mr. W. Harvey Gibbs, builder, King's Heath, Birmingham.

Bedwellty (Mon.).—Police station; Mr. W. Tanner, architect, Shire Hall, Newport.

Birmingham.—Proposed branch premises for Birmingham Co-operative Society. Alterations, etc., to bakery at Leamington, for Banbury Co-operative Society; Mr. F. J. Cooke, architect, Birmingham and Banbury.

Blackrod.—Club-house; Vicar, Parish Church.

Bolton.—Extensions to Townley's Hospital (23,550*l.*); Mr. H. J. Cooper, Clerk, Board of Guardians, Bolton.

Bradwell.—Enlargement of school; Mr. Riley, architect, Education Office, Aylesbury.

Broadstairs (Kent).—Offices and showrooms for the Broadstairs Gas Company.

Broadwell Hayes.—Housing scheme; Mr. B. Meley, Surveyor, Tenby Town Council.

Buckton Vale.—Extensions to Buckton Vale Printworks; architects, care of the proprietors.

Burscough.—Laundry, Victoria-street, for the County Laundry Company.

Caledon.—Dispensary and doctor's residence, Castle lane; Clerk, Board of Guardians, Dun-gannon.

Canonbie.—Parish hall; Surveyor to Parish Council, Canonbie.

Carnarvon.—School; Managers, Roman Catholic school, Carnarvon.

Charley.—Nine houses, Thorpe (1,820*l.*); Mr. William Beauchamp, builder, 25, Victoria-street, Englefield Green.

Clones.—Catholic hall, Church-hill; Mr. J. McDonnell, architect, Belfast; Mr. Isaac Copeland, builder, Whitland-street, Belfast.

Clydebank.—Proposed building on site of Morison Memorial Church; Surveyor, Clydebank Town Council. Extensions to joiners' premises at shipbuilding yard for Messrs. John Brown & Co. Store, etc., Richmond-street, Whitecreek, for the Clydebank and District Water Trust.

Courthill (Poole).—School (4,000*l.*); Mr. Newman, Town Hall, Poole.

Daston, Hilly Field, Gooles, Alltofts, and Norton.—Schools; J. Stuart, County Hall, Wakefield.

Dartford.—Weights and measures offices, etc.; Mr. H. F. Maybury, Surveyor, Kent County Council, West Borough Chambers, Maidstone.

Dodworth.—Proposed new Council offices, etc.; Mr. G. Strutt, Surveyor, Dodworth Urban District Council.

Doncaster.—Factory for Messrs. Anderton & Son, mill owners, Cleckheaton.

Dramlog. N.B.—Memorial Church; Mr. J. McClellan Fairley, architect, Edinburgh.

Dunfermline.—Women's institute, Bath-street (7,500*l.*); Carnegie Trustees. Drill hall, Elgin-street (3,000*l.*), for the Fife Territorial Association.

Dunvant.—Chapel; Mr. W. David, architect, King Edward road, Swansea.

Durham.—Secondary school (11,000*l.*); Mr. G. F. Coates, architect, Shire Hall, Durham.

Eldon.—Church hall; Mr. W. A. Kellett, architect, Bishop Auckland.

Elstree.—School; Mr. U. A. Smith, County Architect, Hatfield.

Falkirk.—Board-room, etc. (1,800*l.*), for the Bainsford and Grahamstown Co-operative Society.

Farcat.—School; Mr. W. Leete, County Offices, Huntingdon.

Felling and Spennyymoore (Durham).—Police stations; Mr. W. Crozier, County Surveyor, Shire Hall, Durham.

Ferry Hill.—Church, Dean Bank; Mr. J. E. Grossart, architect, Sacriston.

Frinton-on-Sea.—Free church; Mr. W. Mayne, architect, Frinton; Messrs. Potter & Sons, builders, Chelmsford.

Gainsborough.—Twenty-one houses (about 200*l.* each); Mr. S. W. Parker, Surveyor, Gainsborough Urban District Council.

Gateshead.—Superstructure of asylum (76,600*l.*); Messrs. William Moss & Sons, Ltd., builders, Baxter Gate, Loughborough.

Glasnevin.—Alterations, Marlborough House; Mr. J. F. Fuller, architect, 179, Great Brunswick street, Dublin.

* See also our list of Competitions, Contracts, etc., on another page.

Gloucester.—Adaptation of No. 3, Well-ton-parade into nurses' home; Mr. H. A. Armitage, Clerk, Board of Guardians, Gloucester.

Gringely-on-the-Hill.—Proposed restoration of parish church (3,500*l.*); the Vicar, Gringely-on-the-Hill, near Retford.

Halstead.—Swimming baths; Mr. Cressall, architect, High-street, Colchester.

Hanley.—Extensions to electricity works; Mr. P. Solon, architect, Town Hall, Stoke-on-Arden, builders, Burslem.

Heddingham.—Alterations, etc., to Isola Hospital; Mr. W. J. Eldson, builder, S. Heddingham.

Helensburgh.—Block of buildings corner West Princes-street and St. Sinclair street; Mr. W. Hunter McNab, architect, Glasgow.

Hockley (Birmingham).—Tramway depot; Messrs. Martin & Martin, architects, Colmore-road, Birmingham; Mr. T. Johnson, builder, Great Brook-street, Birmingham.

Huddersfield.—Dwellings, Mold Green, a model lodging house; Mr. K. F. Campb, Engineer, Huddersfield Town Council.

Ilkeston.—School; Mr. H. Tatham, architect, Sudbury.

Keighley.—Extensions to baths; Mr. Fowles, Surveyor, Keighley Town Council.

Kiveton Park.—New Council chamber, of Mr. J. P. Evans, Surveyor, Kiveton Park Rural District Council.

Linslade.—County school; Mr. Riley, Education Office, Aylesbury.

Llanelli.—Cottage hospital; Mr. D. Edwards, Clerk, Board of Guardians, Llanelli.

Loanhead.—Extensions to engineering workshop for Messrs. McFaggart & Scott.

Low Fell.—Presbyterian church (4,000*l.*); Pastor, Low Fell Presbyterian Church.

Melbourne.—Bakery and shop, Market-place, for the Derby Co-operative Society.

Newcastle-on-Tyne.—Hospital (18,000*l.*); Mr. J. Atkinson, Clerk, Board of Guardians, Newcastle-on-Tyne.

Newton Bank.—Extensions to Newton Bank Printworks for the Calico Printers' Association; Newport and Abercrombie (Mon.). Drill hall for the Monmouthshire Territorial Association, Newport.

Newport (Mon.).—Police station; Mr. Tanner, architect, Shire Hall, Newport.

North Bierley (Yorks).—Extensions to woollen mill (1,000*l.*); Mr. J. E. Helmsley, Clerk, Board of Guardians, North Bierley.

Parkstone (Poole).—Enlargement of school (5,000*l.*); Mr. Newman, Town Hall, Poole.

Park View.—Twenty houses for the Park View Building Club.

Pendyaren.—Proposed 300 municipal houses; Mr. T. F. Harvey, Surveyor, Merthyr Tydfil Municipal Council.

Potters Bar.—Parish church (8,000*l.*); Mr. H. Hocombe, Secretary, Building Fund, of the Vicar, Potters Bar.

Radecliffe.—Infirmary (30,000*l.*); Mr. Popley, County Architect, Shire Hall, Nottingham.

Romford.—Post office, South-street; Mr. Willmott, builder, Woodford Wells.

St. Albans.—New premises for Messrs. Ryder & Sons, seed merchants; Mr. E. Mowbray, architect, London-road, St. Albans.

St. Albans.—New premises for Messrs. C. & C. W. Miskin, builders, St. Albans.

Seaforth.—Reading-room and alterations existing buildings, Bowersdale Park; Mr. Thomas Spencer, builder, Aintree.

Shepton Mallet.—Proposed swimming bath; Mr. D. Hinchcliffe, Surveyor, Shepton Mallet Urban District Council.

Southend-on-Sea.—Presbytery at Roman Catholic Church for Rev. Van Meenen.

Sutton Coldfield.—Additions to "The Hawthorns" (2,000*l.*); Mr. T. Willmott, architect, 6, Waterloo-street, Birmingham.

Tibberton.—Institute; Mr. J. B. Wiseman, builder, Newport.

Torquay.—Alterations to Imperial Hotel (5,000*l.*); Directors, Torquay Imperial Hotel Company, Ltd., Torquay.

Tralea.—Extension, Presentation Convent; Mr. S. F. Hynes, architect, 5, South-mews, Cork.

Wallsend-on-Tyne.—School (12,000*l.*); Messrs. Marshall & Tweedy, architects, Newcastle-on-Tyne.

Wellington (Salop).—Annexe to workhouse (460*l.*); Mr. J. Carver, builder, care of Mr. J. Jones, Clerk, Board of Guardians, Wellington.

Weston-super-Mare.—Church (3,000*l.*); Messrs. C. A. Hayes & Son, builders, Bristol.

Witham (Essex).—Isolation Hospital; Mr. W. P. Perkins, Surveyor, Witham Urban District Council.

Wooler.—Rebuilding parish church (4,000*l.*); Mr. A. B. Plummer, architect, Grey-street, Newcastle-on-Tyne.

Ynysddu (Newport, Mon.).—County school; Mr. J. Bain, architect, Shire Hall, Newport (Mon.).

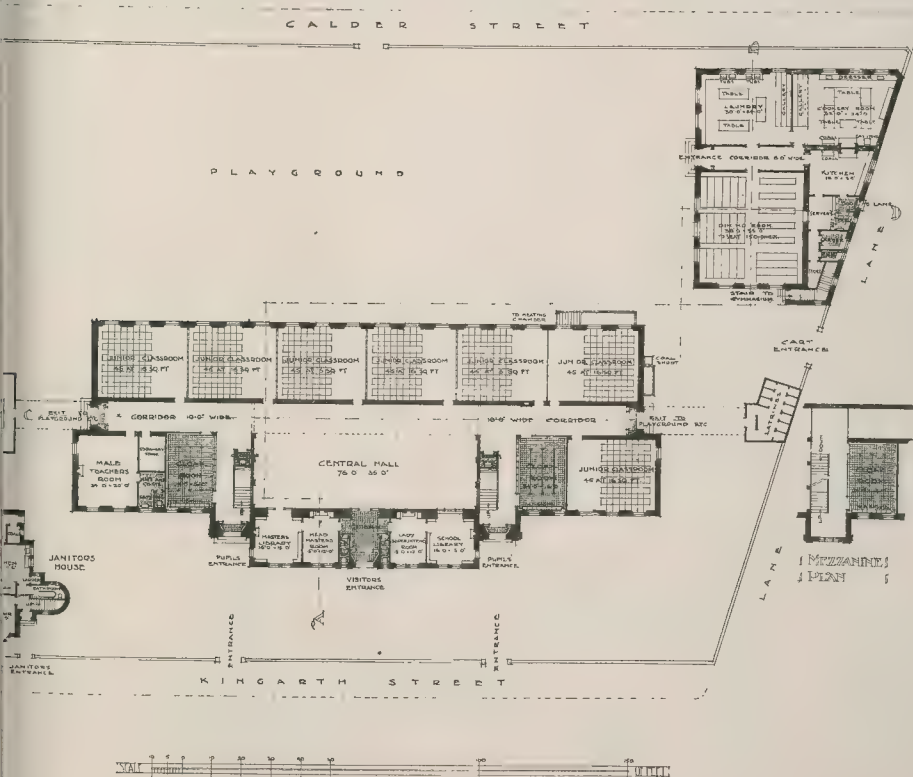

Messrs. Thomson & Sandilands, F.F.R.I.B.A., Architects.

4 the Governors of the Trust felt that, the growing requirements of modern life, they were lagging behind in regard to accommodation, and a large extension was

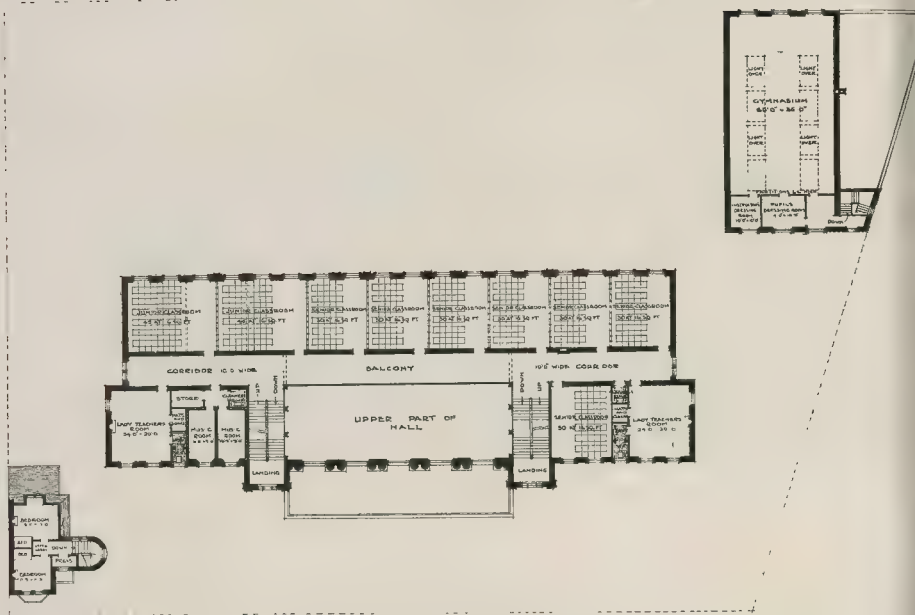

made, which was opened in June, 1896. This addition included several classrooms, art and science rooms, teachers' rooms, cloakrooms, etc.

The increasing demands of the Department in regard to subjects of study, the selection of the school as a junior student centre, and

the regulations which restrict the number of pupils in each class of the Secondary Department, necessitated considerable structural alterations, and the renting of rooms in adjoining church premises. This latter expedient proved highly unsatisfactory, and last session the playground was encroached

Hutchesons' Educational Trust School : Ground Floor Plan.

Hutcheson's Educational Trust School: First Floor Plan.

upon, and a gymnasium and classroom erected. The department, however, could only regard this as a temporary expedient, and the Governors have been compelled to face the necessity of erecting an entirely new school.

The accommodation provided should prove amply sufficient to meet the requirements of an attendance of 800 pupils for many years to come.

The main entrance leads directly into the central hall, which is 2,698 sq. ft. in area. The headmaster's room and library are situated on the left, and the lady superintendent's room and school library on the right of the entrance. There are two entrances for pupils at either side in direct communication with the staircases and cloak-rooms, as well as two exits to the playground.

On the ground floor there are also seven junior classrooms and a teachers' room.

On the first floor are two junior and seven senior classrooms, two music-rooms, and a teachers' room at each end of the building.

On the top floor are six senior classrooms, three science-rooms, and three artrooms. The junior and senior classrooms accommodate forty-five and thirty pupils respectively.

The domestic economy block is situated at the south-west corner of the site.

On the ground floor are laundry and cookery rooms, and a large dining-room for the use of the pupils, with kitchen and storage accommodation adjoining. Upstairs there is the gymnasium with dressing-rooms, also two rooms, furnished as a parlour and bedroom, to be used in the teaching of domestic work.

The heating will be carried out by low pressure hot water on the drop system. The entire building will be lighted by electricity.

The ventilation of the building will be on the Glover Lyon system. This system introduces the fresh air at the ceiling level, and extracts the vitiated air at the corners of the opposite wall.

The architects are Messrs. J. Thomson and R. D. Sandilands, of Glasgow.

The contractors for the whole of this building, exclusive of heating, ventilation, and lighting, are Messrs. P. & W. Anderson, Douglas street, Glasgow.

THE ROAD BOARD FUNDS.

THE recent debate on the action of the Road Board in the administration of the funds led to no decisive conclusion in the absence of the report of the Commissioners which is shortly to be issued. It appears that the sum at the disposal of the Commissioners is about 1,100,000*l.*, and that the applications in England were for sums amounting to 7,100,000*l.* Only three-quarters of a million pounds has been allotted to England, so if the demands made by the various counties represent really urgently-needed requirements it is obvious that the improvements to be effected by the funds at the disposal of the Board will be very gradual, while there is also some risk that, divided amongst so many authorities, the sums allocated may be merely frittered away.

The main question debated was whether

grants should be made by the Board conditional on a contribution on the part of authorities receiving the grant towards improvements to be effected. Such a policy only increases the burden to be laid upon ratepayers, who with some justice complain that certain districts that they are too rated already in regard to the necessity through motor traffic, which brings the advantage. This new form of taxation certainly brought to the fore the question whether the main trunk roads should be maintained and constructed at the expense. Pending so great an innovation, it may be questioned whether funds at the disposal of the Road Board not be invested to better advantage could be devoted to the construction of much-needed new trunk roads on the approved principles, instead of being away in small sums to the various authorities. It will be interesting to see the result of reference to this question.

LEGAL COLUMN.

"Sewer" or Natural Water Course.

IN the case of Attorney-General v. Lewes, the relator was tenant of lands through which ran a stream flowing into the River Ouse, and he claimed a declaration and injunction against the defendants' spect of sewage discharged into the stream, unfreed from excrement. Several writs were raised, and, amongst others, it was contended that the predecessors of the defendant

Hutcheson's Educational Trust School: Top Floor Plan.

ad discharged sewage into the stream under the direction of the Secretary of State between the years 1869 and 1870, when a portion of the stream had been culverted before the Public Health Act, 1875, came into force, and that the plaintiff was therefore stopped from complaining; and it was further contended that there was no continuing injury, and therefore that the action was out of time by reason of the Public Authorities Protection Act. The case, however, really seems to have turned upon the question whether the stream was a natural stream or whether it was a sewer. The stream was partly tidal, the tide passing up the stream and culvert varying distances according to the state of the tides. During certain portions of the year, i.e., between the autumn and May, there was also a freshet. The culvert was out of repair, and thus if the stream was a sewer the defendants would be liable, as the Court held that the sewage caused a nuisance. The judge held the question of whether the conduit was a sewer to be one of fact and degree depending upon whether the channel was used for the reception and carrying away of sewage, and that in this case, as from May to October this channel was used for such purposes only, the channel was a sewer. The defendants contended that unless all natural water was cut off the conduit could not be a sewer; but the Court negatived this contention, and also held that the tide flowing into the stream made no difference. The nuisance being continuous, the plaintiff was awarded damages, and an injunction was granted; but the operation of the injunction was stayed, as the defendants were promoting a sewerage scheme.

LONDON COUNCILS.

Hackney.—Dr. J. King Warry, the Medical Officer of Health, in his annual report, which is just being issued, says: "In the course of inspections of tenement dwellings made in accordance with the Customs and Inland Revenue Acts my attention has been drawn to certain rooms in a large number of three and four roomed tenements in the borough. These rooms are intended presumably for bedrooms, though they corresponded in structure to a bed room and a lighted box-room. These so-called rooms are small, lighted by an ordinary sash window, and provided with a fire in the wall about six inches square, which is guarded outside by a grating; but they have no fireplace or chimney flue. I wish to draw attention to the almost wholesale existence of such rooms recently in connection with the building of a large number of tenement dwellings on an estate under development in the borough. The occupants of flats containing one or more of these rooms recognise their uselessness. If the tenant cannot keep a servant 'living in,' the room question is allotted to her as bedroom. The ventilating hole is promptly blocked up on the first appearance of a cold day, and she sleeps at night practically in a closed box, with no circulation of air. The occupier has a family, one or more of the children are put to sleep in the room, the fire in the wall is blocked up, and the same results follow as in the former case; but, as the younger children suffer more from cold than the older ones, sleeping under such conditions would, no doubt, predispose to disease. The curious point about the construction of such living-rooms is that it is wholly legal. In the Building Acts of London there is no mention of bedrooms. Rooms are designated by the title 'inhabited rooms,' or 'living rooms.' The term 'inhabited,' as applied to a room, is defined in the London Building Act, 1894, as 'a room which some person passes the night' (or which is used as a living-room, including a room with respect to which there is a probable presumption, until the contrary is shown, that no person passes the night therein, or that is used as a living-room). Living-rooms are, as will be seen, included in the above definition. The rules for the construction of habitable rooms are set out in section 70. This section deals with the height of habitable rooms, the provision of windows, their position, size, and the portion to open, the floors, the stairs, and the provision of ventilation beneath such floors; also the construction of the floors of habitable rooms, the provision of stairs, and the separation of stairs from staircases leading thereto. There does not appear to be any obligation to provide any ventilation in the rooms with fireplaces, especially in the case of bedrooms. This is a serious defect, as it is a great want in the Building Acts, better means for the ventilation of habitable rooms can be suggested than a fireplace and a flue. In addition to ventilation, means for heating are also required in every bedroom at certain times of the year, and at

other times in case of illness. Some of the rooms now provided in tenement dwellings are, in my opinion, totally unfit for use, either as living or bed rooms."

Sunbury.—The Council has accepted the tender of Tarmac, Ltd., for tar-paving the footpath in Nursery-road, and the path between Wear House, at the end of the road leading to the cemetery, at the following prices:—15s. 7d. per ton for bottoming and 16s. 1d. per ton for topping. Plans have been passed for Mr. A. R. Harrison, Twickenham, for twenty-six houses, near Park-road North, and for the formation of a new street.

Walthamstow.—A plan has been lodged by Mr. F. H. Douse for four houses proposed to be erected in St. Stephen's-road.

Willesden.—The Medical Officer of Health, Dr. William Butler, devotes considerable space in his annual report to the proposed local application of the Town Planning Act. He writes: "In Germany it has been found that generally the property owner has recognised the wisdom of town extension plans. There many of our municipalities have secured Parliamentary powers enabling them to pool the land and to redistribute it between the different owners. By this means the cutting of wide avenues—which not uncommonly in large towns may attain a width of 150 ft.—does not penalise the owners through whom the land is cut. It is even possible—and, in fact, is arranged—in the case of streets traversing the face of a slope, to build on one side only of a street, so that streets are formed on both sides of a street in such a manner that a beautiful prospect is unmarred for any of the houses built on the slope. Although no such powers of pooling the land appear to have been granted in the Act, it is to be noted that section 53 provides for compensation in respect of property injuriously affected by the scheme, and conversely for recovery of a moiety of the value from any person whose property is increased in value as a result of the making of a town planning scheme. Moreover, sect. 60 of the Act enables the responsible authority, for the purpose of a town planning scheme, to purchase any land comprised in such scheme, and the judicious exercise of this power, together with those powers under the compensation clauses just referred to, should, when applied to such a town as Willesden, enable its further extension to proceed under a comprehensive plan, which, while conserving and protecting private interests, does no injustice to those great civic rights and aspirations which are certain to dominate our newer towns. The garden cities and suburbs which are springing into existence are competitive factors which cannot be ignored by those older communities which have hitherto been handicapped by the lack of those comprehensive powers of planning which are the designers of the model towns possess. Most of the fine trees which the centuries had bequeathed and which judicious planning would have preserved to Willesden have been felled. In the garden cities less thought has been given to their preservation as an object of the designer. The Housing and Town Planning Act has come late for Willesden, but not too late to preserve much of the natural beauty which unimagined and unordained development would otherwise unquestionably destroy."

TRADE CATALOGUES.

The Carron Company forward us two handsomely produced catalogues, devoted respectively to ranges and to registers and interiors. The design of these latter maintain the standard which the Carron Company have taught the public to expect. Several pages are devoted to illustrations of designs for "barless" fires, a type of fire which is rapidly gaining in popularity. The "Carron" ranges are widely known and used throughout the kingdom. The catalogue enclosed forms a convenient reference book for the firm's manufactures, dealing first with every form of portable range, followed by ranges suitable for the methods of cookery which find favour in different parts of the country. We would particularly draw the attention of our readers to the Carron self-acting cottage ranges, in which the crown has two conducting plates cast on the side next the fire, and consequently require no surrounding smoke flue.

We have received from the Armorduct Manufacturing Company, Ltd., of Witton, Birmingham, and Farringdon-avenue, London, E.C., a copy of their new Conduit Catalogue C/1103. The firm have gone to considerable trouble and expense to render it as complete and handy as possible for purposes of reference, and we must admit that their efforts have been attended with success. An important feature in the Armorduct conduit

system is the "Armorduct" flexible enamel. Conduit tubes, as our readers are aware, require protection from the acids and alkalis met with in plaster, and from the moisture of the atmosphere; cheap lacquers and japans render it impossible, from their lack of elasticity, to apply a natural bend without cracking the protecting enamel, and it is claimed that the "Armorduct" flexible enamelling possesses such tenacity as to be indifferent to the rough handling incident upon installation work, and to admit of natural bends. Special attention is drawn to the "Armorduct" patent screwed "knock-out" box, which is manufactured to meet the demand for a screwed universal type junction box. This box is now supplied stop-tapped on every inlet. The firm's multiple oblong junction boxes and distribution interiors for high voltage work should also find a welcome. Among other specialities of the "Armorduct" Company are floor inspection boxes, multiple switch fittings, and watertight fittings. The catalogue should certainly be in the hands of all concerned with lighting installations.

Messrs. Robert Jenkins & Co., of Rotherham, send us particulars of the "Eau-sho" boiler for hot water supply and heating. It is claimed that the "Eau-sho" has solved the problem of producing a hot-water boiler of relatively small size, compact shape, and rapid and effective in heating power. The boiler may be placed in an angle or recess, and be still accessible from the front for cleaning out. When thus placed, Messrs. Jenkins supply a cast front in one piece of sheet-iron casing adapted for the insertion of asbestos. The boiler is horseshoe-shaped in plan, with a flat front, and the feed door will admit an ordinary kitchen shovel, and the mouth of a scuttle. It may be placed in a mantel-opening, when used for warming or supply, and be fitted with a tiled surround, in the same way as a register-grate. Another speciality of the same firm is the "Dual" independent boiler, for heating and service, designed to take the place of the all-copper boiler, necessitated where soft water only is obtainable. The boiler of wrought-welded iron contains a copper coil, connected to the service pipes, so that the water for domestic use is kept from contact with the iron; thus the advantages of a copper boiler are obtained, without the disadvantages of increased cost and inferior durability.

FOREIGN AND COLONIAL.

Technical Museum in Austria.

The technical museum in Vienna, to commemorate the sixtieth anniversary of the reign of the Emperor Francis Joseph, is nearing completion. The contents of the museum will show not only the development of industries and crafts, but will, from time to time, be supplemented to emphasize the progress which is being made. A feature will be made of inventions applicable to labour-saving, and manufacturers are invited to co-operate with the Director in securing objects of interest. Inquiries should be addressed to the Technical Museum, Ebendorferstrasse 6, Vienna.

Building Construction in China.

The sum of 1,203,004, spent by China last year on the purchase of foreign building materials, cement, timber, furniture, window glass, etc., is (according to a report by Mr. H. H. Fox, acting Commercial Attaché to H.M. Legation at Peking), indicative of a far-reaching change which is coming over the habits of the Chinese people. The dilapidated rows of one-storied houses of lathe and plaster, dark, insubstantial, and comfortless, which formerly did duty as Government offices, schools, barracks, etc., are rapidly disappearing before buildings in foreign style of brick and stone, fitted with such up-to-date conveniences as electric light and steam heating. In all the large cities and trading centres, merchants and shopkeepers are replacing the shanties of former days with modern constructions, in which the yanglou or foreign upper story, and the plate-glass window, are usually conspicuous features. The style is more often than not atrocious, and the work shoddy, but in places, like Shanghai and Peking, where the erection of business buildings and Government offices has been entrusted to foreign architects, the results are not unworthy of a European city. As regards such materials as stone and bricks, China is already well supplied, and she is beginning to manufacture her own cement; but good timber, owing to the reckless disregard of elementary principles of afforestation during the past fifty years, is, except in remote and inaccessible parts of the country, entirely lacking. For such articles as steel joists and plates, ironmongery, and tools, corrugated

FOREIGN AND COLONIAL.—Continued on page 259.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvii.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

SEPTEMBER 4. — **Newcastle-on-Tyne.** — The Education Committee invite from architects practising in Newcastle designs for a senior mixed school and a junior mixed school, each to accommodate 365 children. Assessor nominated by R.I.B.A.

SEPTEMBER 6. — **Shogness. Cottages Hospital.** — Mr. E. R. Sutton, F.R.I.B.A., Assessor. Premium 15l. 15s.

SEPTEMBER 9. — **Florest-fach.** — Parish hall, to cost 1,000l. From Mr. J. C. 15.

SEPTEMBER 9. — **Pontefract.** — SWIMMING-BATHS. — Open to architects of the West Riding of Yorkshire. Particulars from the Borough Surveyor.

SEPTEMBER 12-25. — **Athens. COURT OF JUSTICE.** — An international competition is instituted by the Ministry of the Interior, for the erection of Court buildings, to cost 160,000l. The *Official Gazette* may be seen at the Library of the R.I.B.A.

SEPTEMBER 15. — **Lowestoft. SCHOOL.** — The Lowestoft Education Committee invite designs for an elementary school for 500 boys at Roman-hill. Three premiums are offered: 20, 10, and 5 guineas. See advertisement in issue of June 16 for further particulars.

SEPTEMBER 16. — **Manchester. LIBRARY AND ART GALLERIES.** — Limited to the ten selected competitors in the first competition. See issue of June 23, p. 780.

OCTOBER 4. — **Eastington B.D.C.** — 100 model houses for Merton Colliery, Durham. 24 per cent. on net cost to successful architect.

OCTOBER 7. — **Barnley. EXTENSION OF BATHS.** — The Barnley T.C. invite drawings for proposed extension of Public Baths. Three premiums are offered. See advertisement in issue of August 11 for further particulars.

OCTOBER 12. — **Coseley.** — Plans are invited for a school to accommodate about 200 children. Particulars from the Education Offices, Coseley, near Blisdon.

OCTOBER 14. — **Bristol. ALTERATIONS IN THE GRAND HOTEL.** — Particulars from Mr. F. A. Jenkins, 44, Corn-street, Bristol.

OCTOBER 20. — **Holland. STAINED GLASS WINDOW.** — Designs are invited for a stained glass window to be erected in the University at Groningen. See advertisement in issue of June 9 for further particulars.

OCTOBER 31. — **Marlyebone. NEW MUNICIPAL BUILDINGS.** — Premiums of 100l., 75l., 50l. The assessor is Mr. Henry T. Hare, F.R.I.B.A. See advertisement in issue of July 14 for further particulars.

NOVEMBER 1. — **City of St. Petersburg. MONUMENT TO ALEXANDER II.** — Particulars in our issue of August 13, 1910.

NOVEMBER 30. — **Gardif. TECHNICAL INSTITUTE.** — The Cardiff Education Committee invite designs and estimates for a technical institute. See advertisement in issue of August 18 for further particulars. Successful architect to carry out work. Premiums of 125l., 75l., and 50l. to other competitors. Mr. J. S. Gibson, assessor.

NOVEMBER 30. — **Hastings. EAST SUSSEX HOSPITAL.** — The Joint Committee of the East Sussex Hospital, and King Edward VII. Memorial Funds invite designs for new hospital. See advertisement in issue of August 25 for further particulars. Premiums of 125l., 75l., and 50l. Mr. E. T. Hall, assessor.

DECEMBER 29. — **Glasgow. DESIGN FOR A BRIDGE.** — Designs are invited (Alexander Thompkins Travelling Studentship) for a bridge. Premiums of 60l. and 20l. are offered. See advertisement in issue of December 24 for further particulars.

JANUARY 29, 1912. — **Montevideo.** — Government plan (premiums, 2,125l. and 850l.) and town improvement scheme (premiums, 1,060l., 640l., and 425l.). Conditions may be seen at the Board of Trade, 73, Basinghall-street, E.C.

* JANUARY 31, 1912. — **Australia. DESIGNS FOR FEDERAL CAPITAL CITY.** — The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital city. See advertisement in this issue for further particulars.

JULY 1, 1912. — **Dusseldorf.** — A plan for the extension of the City of Dusseldorf. Premiums of 1,000l. to 375l. Conditions on application to the Chief Burgomaster, Dusseldorf.

NO DATE. — **Nottingham. BAPTIST CHURCH AND PREMISES.** — Limited to Nottingham architects. Particulars from Messrs. E. B. & Jackson, solicitors, King-street, Nottingham.

NO DATE. — **Rochedale Infirmary. EXTENSIONS.** — Assessor, Mr. Alex. Graham, F.R.I.B.A.

NO DATE. — **Salford.** — Extension of office accommodation on workhouse site at Eccles New-road. Premiums 20l. and 10l. Particulars from the Board of Guardians, Salford. Limited to architects practising in Salford and district only.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

SEPTEMBER 2. — **Berwick. VERANDAH.** — Erection of a verandah at Infirmary. Plans and specifications from Messrs. Gray & Boyd, architects, 2, Ivy-place, Berwick-on-Tweed.

SEPTEMBER 2. — **Dorchester. BOILER-HOUSE.** — Construction of a new boiler-house at the County Offices. Plans and specification at the County Surveyor's Office.

SEPTEMBER 2. — **Norwich. PREMISES.** — Erection of business premises, St. Stephen's-corner. Plans and specifications, and quantities from Messrs. A. F. Scott & Son, 24, Castle-meadow, Norwich.

SEPTEMBER 4. — **Bradford. LIBRARY.** — Erection of Branch Library, Great Horton. Drawings and general conditions of contract seen, and quantities and forms of tender from the City Architect, Town Hall, Bradford.

SEPTEMBER 4. — **Brynnaen-y. SCHOOLS.** — Erection of a new Council school, and alterations and additions to the Clydach Council School, Swansea. Plans and specifications seen, and quantities from Mr. T. Mansel Franklin, Clerk of the C.C. Glamorgan C.C. Offices, Westgate-street, Cardiff.

SEPTEMBER 4. — **Carlisle. DWELLINGS.** — Erection of sixteen artisans' dwellings on two different sites. Plans and specification by Mr. Peter P. Carbery, C.E., Town Surveyor. Deposit of 2l. 2s.

SEPTEMBER 4. — **Keighley. ADDITIONS.** — For additions to brewery. Plans seen, and quantities from Messrs. J. Haggas & Sons, architects, North-street, Keighley.

SEPTEMBER 4. — **London. W. FLOORING, PLASTERING, ETC.** — The Kensington Board of Guardians invite tenders for providing and laying "Armaflex" flooring, plastering walls, and decorative work to wards 11 and 13 of Infirmary, Marlborough-road, Kensington, W. See advertisement in this issue for further particulars.

SEPTEMBER 4. — **Mottingham. Erection of new urinal at King Edward Park.** Plans seen, and quantities from the City Architect, Mr. F. B. Lewis, Guildhall, on deposit of 1l. 1s.

SEPTEMBER 4. — **Southwark. DRAINAGE.** — Erection of a drain-hall. Plans and quantities from Mr. W. Cooper, F.R.I.B.A., architect, 4, Kirkcaldy-buildings, Huddersfield.

SEPTEMBER 5. — **Bridlington. HOUSES.** — Erection and completion of two houses, St. John's-walk, Drawings, etc., from Mr. J. Barnshaw, architect, Carlton House, Bridlington.

TO CORRESPONDENTS.

TE.—All communications with respect to literary rights, matters should be addressed to "THE BUILDER" (and not to any person by name); those sent for advertisements and other exclusively for publication, should be addressed to "THE BUILDER," and not to the Editor. Communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications. Responsibility of signed articles, letters, and news items at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, but we shall be responsible for the return of photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office unless he has specially asked for them. Drawings sent to or left at this office for consideration should bear the owner's name and address in the top left-hand corner of the drawing. Delay and inconvenience may result from intimation to this office, by a contributor to write an article, execute or lend a drawing for publication, is given to the Editor, who retains the right to reject unsatisfactory. The receipt by the author of an article in type does not necessarily imply its acceptance. Illustrations of the First Premised Design in important architectural competition will always be retained by the Editor, whether they are formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach the Editor not later than 10 a.m. on Thursday. [N.B.—We publish Tenders unless authenticated either by architect or the building owner; and we cannot be responsible for tenders accepted unless the name of the Tender is stated, nor any list in which the Tender is under 1000, unless in some exceptional cases special reasons.]

* Denotes provisionally accepted.

ERSHOT.—For rebuilding bakehouse, etc., for Messrs. Messrs. Reed & Lloyd, architects, not:—
Wells, & Co. £1,249
Kemp & Co. £1,048
Edgemoor £1,080
Bros. £1,049

ROTHNEY (Ireland).—For construction of a reservoir and other works for water supply for the Mr. P. H. McCarthy, architect, 30, West-end-street, Dublin. Quantities by architect:—
Ellis £1,976 8 9
Collen Bros. 8,900 0 0
Mar 9,856 15 5
Martin & Co. 9,770 2 10
J. Graham 9,741 1 6
D. Clarke 9,711 1 6
M. C. Kees 9,616 7 8
McWally 9,616 7 8
L. J. Fitzpatrick 9,179 8 0
Kanturk, Co. Cork* 9,179 8 0
[Engineer's estimate, £9,315.]

ROTHNEY.—For widening and improving street (South), for the Urban District Council, with J. Marsh, Surveyor to the Council. Quantities by Surveyor:—
W. Face £1,975 11 5
M. Carter 1,960 19 7
P. Trentham 1,820 0 0
W. Jenkinson 1,750 0 0
Shrewsbury* 1,750 0 0

ENTRY.—For new second floor offices, Upper street. Messrs. Tait & Herbert, architects, and J. Marsh, Surveyor to the Council. Quantities by Architect:—
F. Elliott £1,375 0 0
Wellerman Bros. 1,365 0 0
Hyde* 1,365 0 0

ENTRY.—For various works, for Messrs. Webster & Co., Ltd., Foleshill. Messrs. Tait & Herbert, architects, and J. Marsh, Surveyor to the Council. Quantities by Architect:—
F. Elliott £178 8 7
W. Face 409 17 0
Hyde* 409 17 0

ENTRY.—For various works, for Messrs. Webster & Co., Ltd., Foleshill. Messrs. Tait & Herbert, architects, and J. Marsh, Surveyor to the Council. Quantities by Architect:—
F. Elliott £178 8 7
W. Face 409 17 0
Hyde* 409 17 0

LONDON.—For enlargement of playground at Marton-road School, Wandsworth, for the London County Council:—
 J. Ford & Sons £633
 Laphorne & Co., Ltd. 600
 W. Hammond 585
 W. & C. Brown 585
 E. A. Jewell 572
 Lathey Bros. 535

LONDON.—For extension of staircase at Rosebery-avenue School, for the London County Council:—
 A. Roberts & Co., Ltd. £800
 A. J. Staines & Co., Ltd. 595
 I. C. Tennant & Co. 585
 J. Garrett & Son 533
 W. Reason 499
 H. W. Crook & Sons, Ltd. 492

LONDON.—For drainage work at Brownhill-road School, Lewisham, for the London County Council:—
 Pasterfield & English £899
 W. Young 884
 R. A. Lowe & Co. 849
 Thomas & Edge 796
 T. D. Leng 796

LONDON.—For erecting playshed at Purrett-road School, Woolwich, for the London County Council:—
 L. Kazak £189
 Thomas & Edge 158
 E. Mills 149
 H. Groves 130
 W. Pollock 130

LONDON.—For painting work at Westville-road School, Hammersmith, for the London County Council:—

W. Brown & Sons £814
 Lole & Co. 694
 A. & F. Follen 577
 T. Bendon, Ltd. 564

LONDON.—For providing and fixing a new boiler at the Peterborough School, Fulham, for the London County Council:—

H. J. Cash & Co., Ltd. £122
 G. & E. Bradley 73
 G. Davis 72
 R. J. Key 58

LONDON.—For building nurses' home and lunacy wards at Hackney Union Infirmary, Homerton, N.E., for the Guardians. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C. Quantities by Mr. G. T. G. Wright, 3, Great Winchester street, E.C.:—

H. J. Carter, Ltd. £24,408
 Fitch & Cox 24,374
 Leslie & Co. 23,507
 T. C. Glynn 22,900

LONDON.—For erecting block of shops, for Messrs. Godline Bros., in Perry Vale, Forest-hill. Messrs. Norfolk & Prior, architects, Catford Bridge:—

T. D. Leng £4,125
 H. E. Kennard 3,250
 Bridge & Galson 3,079

PONTYPRIDD.—For erection of a storage battery, etc. Mr. J. E. Teasdale, engineer, Electricity Works, Trefoert:—

Tudor Accumulator Co., Ltd. £2,340 13
 For Battery Booster and Spare Parts.
 Lancashire Dynamo and Motor Co. £503

TUNBRIDGE WELLS.—For the erection of parish room and library to be known as King's Hall, at Withyham. Mr. Walter Kirk, architect, Withyham, Tunbridge Wells:—
 J. Kingswood, Withyham* £468 10

WATFORD.—For new business premises in Queen's-road, for Mrs. Kempton. Mr. C. F. Ayres, architect, Watford. Quantities by architect:—

G. Wiggs & Sons £1,045
 W. King & Sons 1,036
 G. & J. Waterman 1,017
 A. & C. Saw 979
 W. & D. Wilkins 977
 Ensor & Ward 933

[All of Watford.]

WATFORD.—For additions to Cokemham House, Clarendon-road, for Mr. Thos. Peabody. Mr. Chas. F. Ayres, architect, Watford:—

G. & J. Waterman £422
 Clark Bros. 405

[All of Watford.]

WATFORD.—For erection of a house in the Avenue, for Mr. G. E. Browne. Mr. Chas. P. Ayres, architect, Watford:—

H. Brown £1,310
 Clark Bros. 1,288

[All of Watford.]

WORKSOP.—For erection of children's wards, etc., for the Hospital Committee. Mr. A. H. Richardson, architect, Market-place, Worksop. Quantities by architect:—

M. McCarriock £2,255
 G. G. Middleton 2,160
 Ilett & Sons 2,119
 A. Chadwick 2,100

[All of Worksop.]

WREXHAM.—For reconstruction and improvement of heating apparatus at the Victoria school. Mr. J. England, Borough Engineer, Willow Depot:—

W. Hughes £135
 Jenkin, Davies, & Sons 129
 F. J. Proud & Sons 104

[All of Wrexham.]

MESSRS. F. HALL-JONES & ERSKINE S. CUMMINGS,
A.R.I.B.A., ARCHITECTS.

The Museo Barracco, Rome. (See page 268.)

WE must offer our congratulations to the R.I.B.A. in that they have not been discouraged by the recent rebuff in the matter of St. Paul's Bridge, and are continuing the work inaugurated at the Congress last October, having for its aim the education both the public and the architect in the artistic aspects of town planning. The publication of Part I. of the R.I.B.A. "Suggestions to Promoters of town Planning Schemes" receives the

support of the Right Hon. John Burns, who contributes a short commendatory Preface, explaining the necessity for co-operation and a better organisation to secure harmony between the means of industrial life, the pleasure of domestic surroundings, and the sense of civic beauty.

The document, prepared by the R.I.B.A. strikes us as particularly impartial and well balanced in its definition of the position of the architect in

regard to town planning. It would have been impossible to draw up suggestions of any value without referring to the numerous and many-sided aspects of town planning, but, while these are cited, the expressions of opinion are carefully limited to those that might appropriately come from an architectural body.

The headings used to subdivide the various sections simplify the consideration of the subject, and, while it must be admitted that other points would arise

beyond those dealt with, it may be claimed that they fairly represent the main questions that occur in civic development.

The first section deals with the essentials of the general civic survey—topographical, physical, historical, and economic; the second with the technical methods suitable for recording the actual state of a town. Section three is entitled "New Traffic Facilities," and treats of the working out of the lines of future development and the consideration of the means of access and transport such developments demand. Then in section four we pass on to "Main and Subsidiary Centres," in which a more direct appeal to the architect is made, for, though this portion opens with a note on the economic desirability of a system of centres, it passes on to indicate the artistic value of emphasising important points by grouping public buildings there.

In sections five to eight we return to various aspects of the traffic question in regard to the planning of roads; here we see the practical considerations broadly outlined with a view to showing that they have not been ignored, while the architectural aspect of the case is dealt with in greater detail, though in a spirit so comprehensive and so free from any expression of narrow prejudices in favour of one type of treatment or another as to leave the utmost possible latitude in any application of the rules, if such they can be called, that it lays down. If this portion is open to any criticism at all, it can only be on the ground that it may be a little too catholic, and therefore not quite sufficiently definite in its pronouncements.

Section nine is devoted to the allocation of areas for special purposes, a matter in which we think more difficulty is likely to arise than in any other. However desirable such a procedure may be proved to be, it is so much at variance with the normal habits of the British race that much water will flow under the bridges before it is fully established.

We have been so accustomed to consult only our individual judgment in the selection of sites for various purposes that the submission to authority in such a matter is likely to be resisted. Indeed it may fairly be claimed that at present our municipal bodies are hardly sufficiently educated in this question to be completely relied on. However, time will rectify this, and, after all, it is not so much the architect's affair. Though some in the profession may be well qualified to give useful advice, it will be less in the capacity of architect than in that of one technically experienced in building undertakings.

Turning to section ten, we have a brief but suggestive summary of the requirements in regard to parks, recreation grounds, and other open spaces; here, again, anything likely to unduly limit the ideals of the designer is carefully avoided.

Last, but certainly not least, we come to the question of the buildings; and here the architect's case is stated in the following terms:—

"In the completed town it is the buildings which are seen and produce whatever effect, good or bad, is attained; therefore, the problem of town planning

in its final form is essentially an architectural problem. The working out of the exact form in which the requirements can be satisfied so as to produce a fine town is a function of the creative imagination; and it can only properly be performed by one who has had the architectural training necessary to enable him to adjust the proportions of the many parts, so to place the different buildings, and group them upon the ground and in relation to each other that when erected they may compose properly.

The preparation of all the data upon which the design must be based hardly falls within the province of the architect; and it would seem that this formulation of the city's requirements, and of the limits within which the designer must work, is the proper sphere of the surveyor (aided, of course, by the engineer, the valuer, the economist, the sociologist, and the antiquarian). He should survey the conditions, suggest the requirements, and should be consulted as to the methods of satisfying them; but for the design of the town plan, the architecturally-trained mind is as essential as for the design of a single building; for the work consists in applying upon a wider field and with greater scope the same principles which govern the designing of individual buildings. The appreciation of the relation of masses and voids, the apprehension of the right points for emphasis, and the power to combine into one creation many differing parts by bringing them into harmonious proportion are equally required in the field of town planning, if there is to be produced that rhythm in the plan and that spacious breadth of ordered elevation in the groups of buildings which so largely constitute the beauty and grandeur of cities."

We have little to add to the paragraph just quoted. Architects will see that the R.I.B.A. has made its claim for them modestly but firmly; such a claim will doubtless secure, in due course, the recognition it deserves, provided, and provided only, that architects themselves justify it. It is for the architect to see that he is thoroughly qualified to advise in view of the fact that at any time his advice may be asked for on the question of civic improvements. Let him acquire such a general knowledge of the economic and social aspects of this subject as will enable him to put forward his artistic conception in a practicable form, and thus ensure attention. Of course, no man with ideals of any kind can expect to escape criticism, but if he can meet the critics on their own ground of hard facts his artistic aims will, rightly or wrongly, stand a better chance of securing support.

R.I.B.A. SESSIONAL MEETINGS 1911-12.

The following are the subjects to be dealt with at meetings of the Royal Institute of British Architects arranged for next session:— Collegiate Architecture (Mr. Edward P. Warren, F.S.A., F.R.I.B.A.), The Newer Responsibilities of Architects (The Practice Standing Committee), Colour Decoration (Sir Alfred East, A.R.A., and Mr. Edgar Wood), Modern French Sculpture (Mr. H. Heathcote Statham, F.R.I.B.A.), The French Renaissance (Mr. W. H. Ward, M.A., Cantab., A.R.I.B.A.), Modern Methods of Construction (Mr. Wm. Dunn, F.R.I.B.A.), The Royal Institute Library and Some of its Contents (Mr. C. Harrison Townsend, F.R.I.B.A.), Recent University Architecture in the United States (Mr. R. A. Cram).

THE CENSUS OF PRODUCTION AND THE BUILDING INDUSTRY

THE general character of the Census of Production, issued in the form of Blue Books by the Board of Trade, has been

fully dealt with by the daily Press; it only remains to us to summarise the portion (Part IX.) now published, showing the magnitude of the industry connected with building. As this only be clearly appreciated on the basis of the proportion these industries bear to the whole output of the country, should first take note of the fact that according to this census, the grand total for all trades in the United Kingdom is as follows:—

1. Gross output, selling value, or value of work done, 1,757,000,000.
2. Materials used cost 1,019,000,000.
3. Work given out, amount paid other firms, 26,000,000.
4. Net output, 712,000,000.
5. Persons employed, 6,936,000.

In addition to the number of persons employed given above there are about 100,000 outworkers, so that the average number of persons employed in work covered by the census must be in round figures seven millions.

It should be noted that the output of one trade or factory may constitute materials for other trades or factories, so that the figures relating to gross output and to materials involve a considerable amount of duplication. No duplication, however, is involved in the figure of net output. By adding to the net output the value of materials purchased from sources outside the industry, covered by the table (e.g., from agriculture or from abroad) there would be obtained for all these industries regarded as one unit, the value of the aggregate output ready for consumption or export. The value of such materials was not separately shown in the returns, but it is hoped that it may be estimated at a later period from information available to the Census of Production Office.

The Office register of building and contracting firms was compiled from the trade and local directories, and 118,366 schedules were issued. Of these, however, about 45,000 had to be cancelled as duplicates, or as issued to jobbing men, bankrupts, deceased persons, or persons no longer in business, and nearly 10,000 were transferred to other trades. From the information in the possession of the Census Office it is believed that, of the firms to whom schedules were issued, few of any magnitude have failed to furnish returns.

The "output" shown in the following table is the gross output of each trade, i.e., where goods pass through the hands of several manufacturers at different stages, their quantity and value has been registered at each stage. Similarly where work such as building work has been partly sub-let to sub-contractors the value of the whole work and of each of the parts so sub-let has been independently recorded. The value of this gross output is, therefore, greater than the value of the goods ready for export or consumption manufactured by each trade considered as a unit, or than the value of the work done by each trade considered as a unit, and the value of the "materials

industries in detail. The briefest summary of the contents of this valuable document would far exceed the space we could give.

	Gross Output, Selling Value or Value of Work Done.	Materials Used. Cost.	Work Given Out. Amount Paid to Other Firms.	Net Output. Excess of Column (1) over Columns (2) and (3).	Persons Employed.	Net Output per Person Employed.
	(1)	(2)	(3)	(4)	(5)	(6)
	£	£	£	£		£
Mining and Contracting Trades Including Ventilation, and Sanitary Engineering, Factories and Workshops	87,667,000	28,609,000	6,404,000	42,954,000	513,961	£ 84

Total	156,615,000	69,226,000	6,498,000	\$6,881,000	780,747	—

Our only course is to refer our readers to the Blue Book itself, with the assurance that they will find the statistics clearly and systematically arranged, and that, as far as possible, the subdivision is judiciously classified; though, of course, in an industry possessing so many ramifications as that of building it is not always easy to draw an exact line as to production that comes under this heading and that which does not.

THE *American Architect* makes the interesting announcement that for the first time it is proposed to teach the elements of architecture in the public schools of Los Angeles, California. Some of the architects of that town have been requested to make suggestions, and to draw up a tentative scheme for the consideration of the education authorities. The value of architecture has for some time past been fully recognised by the universities of America, it is perhaps not surprising that the more highly cultured section of the community, which has benefited by a University training, is alive to the advantage of spreading a wider knowledge among the people at large. Considering the importance of architecture in the life of the State, the intimate manner in which it enters into almost every aspect of the life of the individual, and the tremendous influence it exercises on the daily comfort, the health, and happiness of the people, it is a healthy sign that, at any rate, in Los Angeles, architecture is no longer to be regarded simply as a branch of polite learning suitable for cultivation by the assured classes in the academic atmosphere of the University, but as a practical matter which appeals direct to the everyday necessities of the worker. It is in the recognition of this fact by the general mass of the people that the chief hope for the future of architecture seems to lie, and there would appear to be no better way of encouraging its recognition than by familiarising the coming generation with the elementary facts and principles of fine building. Should the examples so worthily set by Los Angeles

be successful, it will no doubt be generally followed in the United States, but it is perhaps too much to expect that it will be immediately initiated here. We have yet to interest academic circles; to convince those in a position to influence the management of our elementary schools: to educate our masters.

THE outlines of the settlement reported to have been arrived at between the conflicting claims of the Natural History Museum and the Science Museum seem to be in the nature of a compromise. The Spirit Room now occupying the site immediately adjoining the Natural History Museum on the north side—which it was proposed to give up to the Science Museum—is to remain. The Science Museum is to be built to the north, and space is to be left on its site for future extensions of the Spirit Room. This looks as if one building will be dovetailed into the other in a way which, we fear, will render any fine architectural treatment impossible. We recognise the difficulties of the problem, but these difficulties are, in our opinion, largely due to the attempt to wedge in another large building, requiring space for future extensions, on an insufficient site. We have already pointed out (July 21, p. 61) the initial mistake in dealing with the whole group of public buildings from the Albert Hall to the Natural History Museum, and can only repeat that if it is worth while building a new Science Museum it is worth while to provide it with an adequate site, even if it has to be paid for. In the meanwhile we are glad to see that there appears

H.M.'S OFFICE OF WORKS are about to clear the site of St. George's Barracks at the rear of the National Gallery. The

barracks were built as a portion of the extensive alterations carried out in that quarter in pursuance of the Acts of 1813 and 1826 (53 Geo. II., c. 121, and 7 Geo. IV., c. 77). They stand on the site of the Earl of Leicester's Green Mews and the Crown, or Upper, Mews—component parts of the Royal Mews which were transferred thither from Bloomsbury in 1534. In the *Builder* of January 17, 1903, is illustrated Wales's print, of about 1750, depicting the south front of the State horses' stables which stood along the south side of Upper Mews—the middle gateway opened into the Upper and Green Mews to the north. That building has been ascribed to Kent, but it seems that the elevation was designed by Lord Burlington, who in 1732 rearranged the Mews for George II.

MR. EDGAR L. CHAPPELL
has contributed to the

Housing. has contributed to the *South Wales News* a series of articles on the deplorable condition of many of the old rural cottages in Wales. It may be within the cognizance of many of our readers that such a state of things may be paralleled in the agricultural labourers' cottages to be found in many other districts of the British Isles. The fact that, despite these drawbacks, the rural death rate is lower than the urban cannot relieve those responsible from the obligation to provide suitable housing for the farm hand, and where the responsibility cannot be fixed on the land owner it becomes the duty of the local authority to deal with the matter. That the death rate from consumption is higher among women than among men in these rural areas may be regarded as an indication of the insanitary state of the cottage home. The man is more exposed to the inclemency of the weather, but this is less injurious than indoor life under unhealthy conditions.

BY WALTER SHAW SPARROW.

THIS subject is very important, and we took a rapid glance at it in my first article, but no time will be lost if we try to get into closer touch with its broad aspects.

There are three lines of descent in the lineage of timber bridges, and each of the three comes down to our times from a very remote period in the life of prehistoric man. Sometimes they unite and sometimes they intersect, and the results produced by their separate action and by their intersection evolve traditions and types in the art of building. It is convenient to put a name on these lines of descent:—

1. Primitive endeavour, which often hardens into stereotyped forms of unskilled carpentry.
2. Primitive carpentry of a progressive order.

Brandon Creek. Type of Norfolk Timber Bridge.

From Francis Stone's "Norfolk Bridges."

3. Skilled and constructive carpentry in which mechanics and fine art go hand in hand together.

The first line of descent had its rise in two ways—in overthrown trees, which may be called windfall bridges, and in branches of trees that happened to span rivers from opposite banks. These were the earliest suspension bridges, and natives use them now in Central Africa.

The nature-made bridge is older than the remains of the Galley Hill man, the earliest known Briton, whose age has been estimated by Professor Arthur Keith as about 170,000 years, perhaps more, and whose skeleton, dug up from palæolithic gravel in Kent, together with teeth and bones of the mammoth, a tooth of the hippopotamus, and a lion's foot, is well within the range of variation in recent man. This wonderful fact is admitted by all anthropologists.

So we may rest assured that the cradle centuries in the nursery of the human race preceded the Galley Hill man by a long, indefinite time—long enough to get rid of simian characteristics. Indeed, the Galley Hill man was contemporary with remarkable attainments in the line of art, sculpture, engraving, and painted decorations on the walls of caves. Hunting, too, required infinite resource and pluck and skill, because the fauna comprised lions, bears, hyenas, sabre-toothed tigers, bisons, the mammoth, and the woolly rhinoceros. It is clear, then, that 170,000 years ago, or thereabouts, the intelligence of man was alert and wideawake; and this is a thing to be kept in mind when we think of the romantic descent of bridges from a tree which a storm of wind had hurled astride some deep hollow in the ice or in the land, making a safe footway for an early ancestor of the Galley Hill Briton.

From this accident we pass on to a tree which man himself cut down deliberately in order that it might span a dangerous gap in a field of ice or an abyss formed by a mountain torrent. Human intelligence, the inventor of sculpture and painting, would wish to do what a gale of wind had done by accident; and from that moment the first principles of secure bridge-making were discovered. Not only was the footway strong and firm, but branches growing from the tree-trunk gave support to the hands. Any bough that blocked up the way could be topped off with a flint axe, till at last no handholds would be left save those which were convenient and necessary. Even to this day in country woods we find rustic bridges having not much more art, bridges so narrow and so simple that the footway, roughly hewn from a tree-trunk, is rudely guarded at the sides with handrails of dressed branches.

This first type of bridge is a narrow pathway for men walking single file. But its descendants are many and various. I will mention a few. The earliest would be suggested by circumstances of war. A single tree-trunk stretching from bank to bank would not be of much help in a rapid attack, since the act of crossing it single file would be a slow movement and quite easy to repel. On the other hand, if several tree-trunks were laid side by side several warriors could advance abreast; and if the tree-trunks were placed at some little distance from each other, then covered transversely with branches and with turf and soil, a still wider bridge could be made with the exercise of less invention than that which Quetzalcoatl loved to exhibit both in his rock-painting of animals and in his sculpture. If you consult Don Antonio de Ulloa (1716-1795), you will find that bridges of this type

Ditchingham and Bungay. Type of Norfolk Timber Bridge.

From Francis Stone's "Norfolk Bridges."

have long been made in the mountainous parts of South America. He says the wooden bridges "consist of only long beams laid close together over precipice, and form a path about a yard and a half in breadth, being sufficient for a man to pass over horseback."

Other types of the primitive bridge suggested by man's earlier efforts to make home for his family. Thus, for example, the construction of the first lake-dwelling was a great event in the primeval era of bridge-making; and we infer, from evidence that still exists in different parts of the world, that the foundation of timber under lake-dwellings became useful in spanning rivers, as among the Gauls, whose methods of bridge-building united the footway of felled trees to a crossing of tree-trunks to form piers and abutments. This Gaulish handicraft has survived in Savoy, and we find an Eastern parallel in the log piers of Kashmir bridges, whose descent from lake-dwellings is often strikingly suggested by quaint little rude booths or shops along the footways.

Again, another development from the primitive bridge is what I may call the step-ladder bridge, such as you will find at Bettwyl-Coed, where the Miners' Bridge takes a sharp angle from a low level to the summit of a bank. That is a ladder rather than a bridge; and a similar thing, but more adventurous and intricate, was seen in Tibet by Capt. Turner in 1783. It was a bridge of turpentine-wood forming a ladder; these were inclined towards each other, but separated at their tops by a considerable space, across which was a level platform. The ladders tapered upwards, their lower ends were fixed in masonry, and handrails aided the ascent. This bridge, in 1783, was said to be 140 years old. Its purpose was to escape from floods, and so to connect it with that old type of European bridge which ascended at a sharp angle to the centre and then shelved downwards. Many railway lines of to-day are crossed by stepped bridges having a horizontal platform at top to connect their sides.

But these bridges are all firm and heavy and you will think of other primitive examples which are frail, like Congo bridges of boughs and stakes and bindweed. When came these fragile structures? From the primeval art of the round hut, from the architecture of rods interlaced with osier and plastered with mud and clay? Still bridges and bamboo bridges belong to the phase of human handicraft having a certain frail elegance, a certain revolt against mud and clumsy heaviness. Such work is often ineffectual, yet it lives on in a good many parts of the world, and here and there it has some architectural charm, notably in the roofed bridges of bamboo at Sumatra for protection against heat. In another old type of covered bridge, namely, the Swiss, the aim is to keep the footway free from snow. But the odd thing is that the timber bridges of Switzerland are still primitively rudimentary in construction; they seem to show no advance on the Pons Subleicius of the Romans.

Several authorities have attempted to restore the Pons Subleicius from descriptions given in the historians, and I met two of the restorations, one by Canina and the other by Colonel Emy. They differ much, Canina strengthening the footway between each span, fixing a beam slantwise from each road bearer to one of the pier timbers. Colonel Emy, on the other hand, chooses a slighter design, in which I do not feel the genius of the Roman people. That the Subleician bridge was a solid structure, very difficult to destroy, is vividly shown in the legend of Horatius Cocles and the great fight which he and his two companions fought against the whole Etruscan army under Porsenna. It was necessary for them to keep the enemy at bay while the Romans broke down the bridge behind them, and the

ory does not lead us to suppose that many
res made a gap without much difficulty.

The Roman timber bridges, as described
by the historians, have had many modern
descendants. Palladio built one at Bassano,
the Bridge of Brenta, but he added a roof
carried by slender wooden pillars. There
were five arches of 12½ metres each, and a
roadway 9 metres wide. The beams bearing
from pile to pile were strengthened with
raining beams and with braces; this
formed a rude approach to an arch of
timber, and like an arch it exerted a lateral
thrust and required abutments. Perhaps
you have seen illustrations of a wooden
bridge designed by Robert Stevenson and
built over the Clyde at Glasgow in the years
1831 and 1832. The main principles were
precisely similar to those both in Palladio's
work and in the drawing by Canina of the
Pons Sublucius.

Stevenson's bridge had fourteen spans,
each of 34 ft., measured from centre to centre
of the piles forming the piers, and giving in
all a waterway of 476 ft., uninterrupted
except by the narrow width of the piles.

A plan of framework consisted of seven ribs,
each composed of three beams—that is to say,
two diagonal braces and a horizontal
raining beam. The braces were 13 in.
depth and 12 in. broad, and each straining
beam was 12 in. square. The whole
structure was carried by thirteen rows of
sinking piles. Seven piles made a row,
spaced at a distance of 5 ft. 2 in. apart,
and secured to each other by four pairs of
star braces.

To find European timber bridges of rare
excellence we must study the three great
masterpieces designed and brought to com-
pletion by the brothers Grubenmann, and
destroyed during the war of 1799. Ulrich
and Jean Grubenmann were village car-
penters, born at Teufen, in the canton of
Appenzell. Ulrich seems to have been the
elder of the two; certainly he was a man of
true genius, who gained unrivalled know-
ledge of what could be done in the spanning

of great distances by a skilled use of corbelled
and trussed bearings. He began the bridge
of Schaffhausen in 1755-56, and in 1758 his
work was complete. The total distance
covered in two spans was 364 ft.; the stone
pier was 8 ft. out of a straight line, and the
angle pointed upstream. The abutment near
Schaffhausen was 171 ft. from the angle,
and from the angle to the opposite shore was
193 ft. Ulrich would gladly have spanned the
whole distance in a straight line and in one
magnificent bay, but the authorities inter-
posed, ordering him to find use for a
masonry pier remaining from a stone bridge
which a flood had ruined in 1754. Telford
believed that Ulrich Grubenmann could have
built the whole structure over the Rhine
in a single suspension from abutment to
abutment. So perfect was the work, so
admirably scarfed, trussed, strutted, braced,
bolted up, and suspended, that only two faults
could be found with it—namely, the roof

was too heavy and ugly, and the parts were
too dependent on each other, so that an
injury to one portion of the structure from
a cannon-ball, for instance, might have proved
disastrous to the bridge as a structure.

Grubenmann's methods were simple.
"The braces proceeding from each abut-
ment," said Telford, "are continued to the
beam which passes along the top of the
uprights, and the lowest of these general
braces are actually united under that beam,
thereby forming a continued arch between
the abutments, the chord line of which is
364 ft. and the versed sine about 30 ft.
These braces are kept in a straight direction
by the uprights, which are placed 17 ft. 5 in.
apart. If this bridge had been formed in a
straight line between the abutments I can
see no reason why this form of construction
should not have supported a roadway of
about 18 ft. in breadth, as well as a slight
roof; because, in that case, all the weight

Mendham. Type of Norfolk Timber Bridge.

From Francis Stone's "Norfolk Bridges."

Newcastle, North Shields, and Tynemouth Railway: Willington Dean Railway Viaduct. Victorian.

arising from the braces which proceed from the middle pier would have been saved, and the roof might have been made much simpler and lighter."

While Ulric Gruenmann was working at Schaffhausen his brother John built a bridge quite similar in kind at Reichenau, 240 ft. in a single span; and then, some years later, the two brothers constructed their Wittingen Bridge over the Limmat, near Baden. It had a span of 390 ft. The form of construction was different. Seven beams were built close upon each other, forming a catenarian arch between the abutments, with a rise of 25 ft. The beams were of oak, in lengths of 12 ft. or 14 ft., breaking joint in the manner of masonry. They were not fastened by pins, bolts, or scarfings, but were

First Arch of Schaffhausen Bridge. By the Brothers Gruenmann.
From Professor Jenkins's "Bridges."

kept together by iron straps placed 5 ft. from each other and fastened by bolts and keys. The roadway intersected them at about the middle of their rise.

The influence of the Gruenmann brothers travelled to America, where it found in Bludget an able interpreter, for Bludget's bridge over the Portsmouth River was similar in principle to the bridge at Schaffhausen over the Rhine, and its span was 250 ft. Since that time the evolution of timber bridges has remained in the U.S.A., where it may be studied in work having great variety, for it ranges from the criss-cross of logs for bearing piles to the most intricate combinations of lattices and trusses. There is at times too much intricacy. "Many wooden American bridges are trusses which

The Pons Sublicius, Rome. Reconstructed by Colonel Emy.
From Professor Jenkins's "Bridges."

almost defy analysis, the designs being, however, obviously suggested by an attempt to combine at least two of the three types of bridges. No advantage whatever is gained by a combination of this kind; on the contrary, great disadvantage is almost sure to follow its adoption, namely, that it will be impossible that each part of the structure should, under all circumstances, carry that portion of the load which the designer entrusted to it. For suppose a bridge constructed partly as a girder and partly as a suspension bridge, the girder being very stiff and deep, the chain perfectly flexible with considerable dip. Let the chain and girder each be fit to carry half the passing load. It is perfectly conceivable that the deflections of the two should be so different that the girder would, under the actual load, break before the chain was sensibly

The Pons Sublicius, restored by Canina

strained, or the difference in the relative dip of the chain and depth of the girder might be such as to cause the former to give way first." (Professor Fleeming Jenkin.)

And many American bridges provoke another criticism they belong to a nation that believes itself to be free from the dangers of war in its own home territories. Think of the giant Portage Bridge, and imagine a modern shell falling upon its woodwork, which rises on a huge scaffold of timber frames over the Genesee River, 234 ft. above water level. The scaffold piers rest on masonry piles above the level of floods, and they taper upwards to a double gallery forming a support for the railroad. The general effect has the trellised fascination of a scaffolding, and we see in the design that same passion for a sort of airman'ship in light craftsmanship to which street architecture in the U.S.A. owes the sky-scraper.

In a later paper an attempt will be made to consider modern bridges in their relation to those preparations for war that turn so many countries into armed camps.

THE MUSEO BARRACCO, ROME.

By LIONEL B. BUDDEN, M.A.*

In Italy the artistic movement known as the Greek Revival left few architectural memorials. As the Latin builders were for the most part unaffected by the mediæval forms of constructive expression common to the greater part of Europe between the XIIth and XVth centuries, so throughout the period of Gallic and Teutonic Hellenism, some three hundred years later, Italian architecture pursued a traditional course. But the tendency of modern times towards a cosmopolitan style, and the international influence of the French and American ateliers have, during the last two decades, become irresistible factors in the development of Classic design, even south of the Alps; and if examples of the change in point of view and of practice are few enough, they are of profound significance, since they indicate in some degree the future possibilities of a vital manner.

The neo Grec cemetery at Milan has real breadth and imaginative force. The pavilion of the Royal Rowing Club at Venice shows a sensitive delicacy in design worthy of Burton. Between these extremes of an infinitely flexible register are other works in Rome, Florence, and Naples that reveal the same living quality of thought, the same sincerity of endeavour—works that are as far removed from archaeological scene-painting as the most modern and original products of the American schools.

To this general rule there is one conspicuous exception, the Museo Barracco, in Rome. It is largely conventional in idea, and professedly antiquarian in the inspiration of its detail. Yet since it has provided the occasion for an elaborate essay in polychromatic decoration, it is sufficiently remarkable to merit very careful consideration. Certain monumental buildings in modern Athens afford parallel instances of the application of a complex system of polychromy, but their treatment is different, though expressive of a similar mental attitude.

An explanation of the character of the Museo Barracco may be gained from the circumstances under which it was designed. About ten years ago the architect, Signor Alex. Koch, was commissioned to prepare designs for a small private museum of sculpture. His client was the famous Roman connoisseur, Senator Baron Giovanni Barracco. To the latter's influence, rather than to the architect's natural inclination, is due the attempt at literal reproduction of Attic detail in many parts of the work.

In 1904 the erection of the Museum was begun, and in the following year the finished work, with the admirable collection of sculpture it was intended to contain, was presented to the City of Rome by Baron Barracco. The site upon which the building stands is an island area facing the Corso Emanuele, near the Ponte S. Angelo—an area large enough

to permit of a surround of shrubs on north, south, and east sides; a low wall serves as the continuous pedestal to an ornamental iron railing encloses the garden. The isolated, and with the dull plaster fronts the neighbouring houses acting as a simple foil, the effective brilliancy of the design immeasurably assisted.

Its construction is deceptive, even on close examination. On the street façade capitals, bases, and shafts of the columns, pilasters, the podium and steps and the wall up to the fretted band are of white stone. The band itself, the window piers, and the entablature are of plaster. Under the pilaster, the cornice, and architrave to the entrance are stone, and the spaces above the fret on either side of the door head have plaster infilling, the entire side and the elevations (the latter marred by a recent addition) are of plaster, the steps alone being stone. All the doors are constructed in wood stained a bronze green, and heavily studded. Frosted glass in gilded metal frames is used for the windows.

To some extent mistakes in composition are cloaked by the brilliant colouring of the whole. In bright sunshine every detail has a rich vivid value that combines to produce a general impression of sumptuousness, and to deaden intellectual realisation of the

Plan of the Museo Barracco, Rome.

quality of the architecture. The disposition of the main Order itself in relation to the wall surface on either side of the portico is ill-considered, for the vertical lines of the pilasters produce spaces that are awkwardly proportioned; and, in addition, the entablature is made to appear to be insufficiently supported over the spaces thus formed. With this error in judgment is penetrated blunder in the elementary principles of composition. At the junctions of the portico and main face of the building all respond to the end pilasters is omitted. The recessed pilaster alone is echoed in each case, and the full-angle pilasters of the portico are intended to be read at the same time, both as responds and as integral parts of a complete feature. If mistakes of such a nature are fairly frequent in English Renaissance work—Inigo Jones and Wren having sanctified them by repeated commission—they cannot be charged with impunity in a style that demands absolute clarity of thought. Again, the purpose of the window piers is clumsily achieved through either ignorance or disregard of logical practice. From Schinkel to Alexandre Thomson the great masters of the Revival realised in their executed work the possible solutions of the aesthetic problem that here occurs. Subsidiary Ionic piers coming directly below an entablature proportioned to an Order considerably larger in scale than that of the piers themselves they found only to be practicable in the form of three-quarter, half or quarter piers in combination with the column of the Order, i.e., in the manner employed in the case of the end piers in the work under consideration. To justify their standing free and still retaining Ionic slenderness of proportion a subsidiary entablature with repressed cornice and designed in relation to their own height, must be introduced

* For correction of certain notes I am indebted to Mr. Ernest Gee, who made a careful study of the building in the winter of 1910 as Travelling Scholar of the Liverpool University School of Architecture.—L. B. B.

rectly below the main entablature. Indiscretion in detail could be multiplied, but to little profit.

It is as an exercise in colour that the sign is intended to be accepted, and as such one can it be most relevantly criticised. I have already remarked that in the convention of the colouring the work is reminiscent of several modern performances in Athens—in ritual Hansen's Academy; but the contention is bolder, harder, and certainly less weak. A broad effect is obtained from the imitation of certain main tones—the light of the tile roof, the blue of the tympanum and of the frieze to the main entablature, the dark red of the lower portion of a window piers, the bronze-green of the cornices, and the glistening white of the main architrave, columns and pilasters, walls, and steps. With these as the determining factors in the arrangement subordinate colour themes are elaborated for every minor part. Practically every member treated in some manner, though the range of pigments is very restricted—primary red, blue, bronze-green, gilt, yellow ochre, and terra-cotta.

The main entablature and acroteria—both parently influenced in their design by the Hellenistic work till recently contained the Pergamon Museum in Berlin—are given Ionian brilliancy by the lavish application of unrelated colours, under which the rather resolute character of the decorative adjuncts of the delicate profiling of the members of the cornices are alike obscured. Palmettes, egg, yellow, and red, composed with leaves of scrolls, on a variegated background of blue and yellow ochre, form, however, a composition unprecedented even in Pergamene acroteria; whilst the polychromy of the cornice is extraordinarily fresh. Fillets of white and gilt; a cyma, patterned into alternately-burning spaces of yellow and blue by white thomson (tooled to appear like carved stone), and punctuated with yellow lions' heads; and anti-rolls, terra-cotta, yellow, and red; the fascia; egg and dart moulds of blue, terra-cotta, and white; painted yellow water-veins under the soffit; and on the soffit, flat slightly sunk, a yellow-ochre fret on a white ground; finally, white dentils picked out by vermilion interspaces.

In definite contrast to this minute and intricately-conceived system comes a frieze of blue, broken only over the portico by an inscription panel—white with terra-cotta lettering. Between the frieze and an equally simple architrave of three white fasciae are nine mouldings treated in the elaborate manner of the cornices, white and gilt fillets, terra-cotta bead mould, and a small cyma-versa, on which is painted yellow and blue leaf ornament.

The rich complexity of the cornice is again noted in the capitals to the columns and pilasters. On the abaci the egg and dart motif is marked out in yellow and terra-cotta; a white ground; green is used for the fillets of the volutes, and red for the eyes, the annals being left white; blue and yellow is applied to the egg and dart above the necking, from which the latter is separated by a white bead-mould (that develops into a red and white bead and reel beyond the cushion); white anthemion on a yellow ground comprises the treatment of the necking. Thin terra-cotta lines emphasise the arries of the white columns and of the fluted faces of the pilasters. (On the unfluted faces of the latter the lines recur simply as a pattern.) Red pigment similarly distinguishes the 4-in. by 1-in. jointing of the ashlar walls of the side and rear plaster walls.

In various combinations and rearrangements the colours and painted motives already described enrich the bases of the columns and pilasters, the side-door cornices, the caps and soss of the window piers, and the fretted pil on which the piers stand. The climax reached in the treatment of the interior of the portico, which may be regarded as the *œuvre de résistance* of this whole effort in polychromatic art. A film of rich colour—gilt interwoven with blues, reds, and yellows—covers the architrave and rosettes, the cornices, and cornice of the main entrance, whilst upon either side of the door-head and above the fret level are paintings on a brown frieze, conceived and executed in the manner of the Attic vase scenes of the Vth century. Archaeological though the inspiration of the polychromy undoubtedly is, and insufficient

though the scholarship necessary for its realisation may have been, the experiment attempted is by no means valueless. If it is unreliable as an example of ancient practice, it contributes something definite to the science of modern architecture and something that could only have been obtained by material illustration. It assists towards an estimate of the possibilities of development of a whole system of colour decoration.

Close examination of the architectural detail reveals a mistaken application of many forms, and in the plaster portion of the work a coarseness in surface texture and in the articulation of members that is directly opposed to the treatment demanded by the material. Now, as the work very clearly shows, the crudity of minor indiscretions is almost completely destroyed by a veneer of pigment. It is lost in the paraded ingenuity of intricate colour themes. The main entrance affords an instance—one of many. A reproduction of the doorway under the north porch of the Erechtheion, the transposition is so faithful that even the late Byzantine door-jambes are repeated—being apparently accepted in all sincerity as part of the original design. Yet under its polychromatic cloak the blunder is not readily recognised.

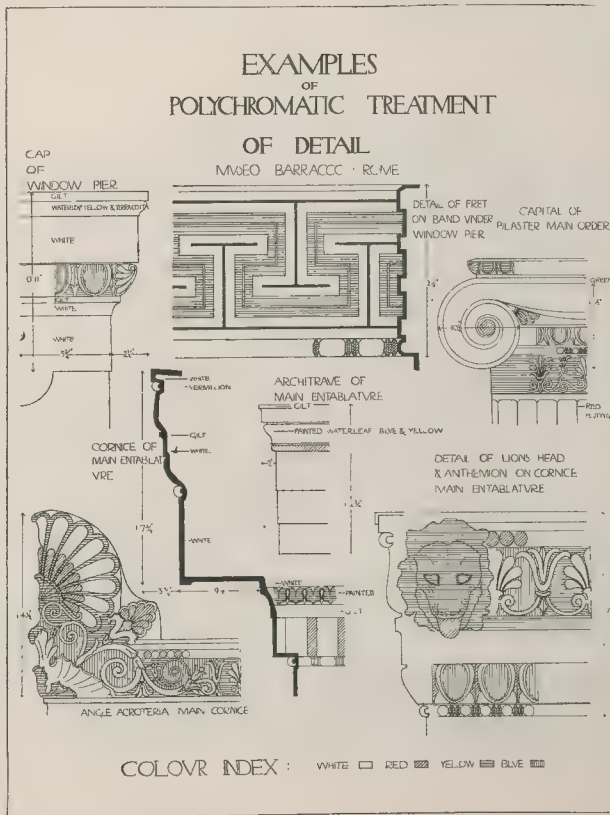

But where as impurity of form on a small scale is rendered less obvious and offensive by the studied employment of colour, precisely the converse is true in the case of larger features. Thus the unfortunate window piers are given an extravagant emphasis by a colour treatment no harsher than that adopted throughout for the detail of the building.

A real danger lies in the possible tendency the adoption of such a process of enrichment may have to subordinate the instinct for absolute form and its arrangement to the pursuit of colour effect, and so destroy the most vital and essential quality of architectural expression. To the genius of the Vth century, Athenian architects, backed by artisans whose sense of mass and line was as certain and as subtle as their own, and who

had inherited and perfected an incomparable technique, the polychromatic ornamentation of structures presented no perils. It was a process contributing only to the beauty of the architecture. Few colours were employed, but through a fine adjustment of tone and contrast the most splendid and brilliant results were obtained. Under modern conditions the attainment of such a level is practically impossible. Even in architects of distinction the requisite mental faculty is rare enough, and the technical tradition, equally necessary, has been dead nearly two thousand years. A Hansen or an Alexander Thomson many from time to time make a courageous effort to revive the beauties of the art, but their success is individual, and leads to the formation of no real school. Their imitators in general achieve little else than a vicious gaudiness or an æsthetic negativity, and in neither is the force or delicacy of the architecture assisted. Attention is merely diverted from the structural composition to the arrangement of the colour and its relative values and total effect. The degradation of architecture as a frame for sculpture is not more complete than in its use as a canvas for the distribution of colour.

In North Europe the possibilities of development in the polychromatic treatment of design are by the exigencies of climate confined to interior work. Even in small external details this rule is valid. (The splashes of gilt and red which distinguish the capitals of the Ionic colonnade to Schinkel's Altes Museum in Berlin, though intended to echo the mosaics on the inner wall, serve rather to create an impertinent interruption in the dark austerity of the building, on whose larger surfaces the weather will not permit the application of colour.) Excluding the use of ceramic tiles and the actual difference in the hues of the materials, architecture must be with us monochrome.

Both of what we gain and of what we lose by the restriction the Museo Barracco may be fairly regarded as an indicative example.

ARCHITECTURAL SOCIETIES.

Royal Institute of the Architects of Ireland.

An ordinary meeting of the Council of the above body was held on the 4th inst., at 31, South Frederick-street, Dublin. Mr. W. Kaye-Parry, F.R.I.B.A., was in the chair, and there were also present:—Messrs. F. Hayes, H. Allberry, A. G. C. Millar, F. G. Hicks, G. P. Sheridan, Lucius O'Callaghan, G. C. Ashlin, and C. A. Owen, Hon. Secretary.

The minutes of the ordinary meeting of June 12 and of the special meeting of July 26 were read and signed, and a large amount of correspondence dealt with, including applications for admission to studentship. A report from the Professional Practice Committee in reference to a proposed revision of the schedule of charges was approved and adopted. A vote of condolence with the family of the late Mr. W. H. Hill, of Cork, was passed.

COMPETITION NEWS.

Railway Staircase at Marseilles.

A competition, limited to architects practising in Marseilles, has taken place with the object of obtaining a design for a monumental staircase giving access to the Saint-Charles Station at Marseilles. The first premium of 120l. has been awarded to MM. Eugène Sénès and Léon Arnal, whose design, remarkable for its simplicity, is a flight of steps continuing in a straight line the Boulevard d'Athènes. At the sides of the imposing staircase are lions, bronze candelabra, and groups symbolical of the commerce of the city; and the whole conception is dignified and effective. The second prize, 60l., went to MM. André Ramasso and Edouard Rambert, and M. Etienne Bentz received the remaining 20l.

Proposed Statue in Havana.

H.M. Legation at Havana report that a competition has been opened by the Cuban Government for the erection at Havana of an equestrian statue of the Cuban General Maceo. Plaster models should be sent by

sculptors desirous of competing to the "Comisión Ejecutiva, Monumento al General Antonio Maceo, Secretaría de Instrucción Pública y Bellas Artes," Havana, before January 20, 1912. The sum of 100,000 pesos (about 20,600l.) has been voted for the work. British sculptors proposing to compete should first put themselves into communication with the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C., where also further particulars (in Spanish) may be seen.

GENERAL NEWS.

Official Delegates to the Architectural Congress.

The following Official Delegates are attending the International Congress of Architects at Rome next month:—H.M. Government will be represented by Sir Henry Tanner, I.S.O., C.B., F.R.I.B.A., of H.M. Office of Works; the London County Council by Mr. W. Edward Riley, F.R.I.B.A., A.M.Inst.C.E., R.B.A., Superintending Architect, London County Council; the R.I.B.A. by Mr. Leonard Stokes, President, R.I.B.A.; Mr. John W. Simpson, Vice-President, R.I.B.A., Secrétaire Comité Permanent International des Architectes; Mr. John Belcher, R.A., F.R.I.B.A., Vice-President of the Comité Permanent International des Architectes; and Mr. John J. Burnet, LL.D., A.R.S.A., F.R.I.B.A. The Liverpool Architectural Society is sending Mr. Arnold Thornely, F.R.I.B.A., the President of the Society; the Devon and Exeter Architectural Society, Mr. James Jerman, F.R.I.B.A., the President of this Society; the Dundee Institute of Architects, Mr. W. Fleming Wilkie, F.R.I.B.A., President of the Dundee Institute; the Manchester Society of Architects, Mr. Percy S. Worthington, F.R.I.B.A.; and the British Fire Prevention Committee, Mr. Edwin O. Sachs, F.R.I.B.A., Chairman of the Committee.

Science Museum.

Mr. Francis Grant Ogilvie, C.B., LL.D., Secretary for the Science Museum and Geological Survey and Museum, has been

appointed Director of the Science Museum. Mr. Ogilvie graduated as B.Sc., Edinburgh, he was Director of the Edinburgh Museum of Science and Art, 1900-3, and Prior Assistant Secretary, Board of Education, 1903-10.

Ordnance Survey.

Lieut.-Colonel C. F. Close, C.M.G., has been appointed Director-General of Ordnance Survey in succession to Col. S. C. N. Grant, C.M.G., R.E.

Huddersfield Memorials to King Edward VII.

Mr. P. Bryant Baker is at work on a bronze statue of King Edward, which will be erected in Huddersfield. The late King will be represented in his Garter robes, and will be emblematic bronze tablets. A from the statue, a sum of 24,000l. has been subscribed to endow a wing in the Huddersfield Infirmary.

King Edward VII. Memorial, Newmarket.

Sir Ernest Cassel has acquired and has presented to the Newmarket Urban District Council, the Grafton House property in H and Fitzroy streets. The property, extending over 2½ acres, belonged to the late King and will be preserved as an open space dedicated to his memory.

British Museum: Report for 1910.

In his annual report upon the general progress at the Museum, in Bloomsbury, Mr. Kenyon states that the total number of visits in 1910 was 739,837, as compared with 708,836 in 1909, and the number of visits to the Reading Room was 219,274, an increase of 1,500 and the third highest recorded, the daily average being 726. The report refers to the purchase of a large collection of the late Sir Francis S. Haden's engravings, and of the Wegener collection of ancient Chinese paintings, to the Salting bequest of prints and drawings, and to the acquisition of the stone sarcophagus of Qem-Pu, 200 B.C., from Memphis, decorated, both within and without, with figures of the gods of the dead and scenes and texts of the Am-Tuat, or guide to the after world. The number of visits made by the public to the Natural History Museum was 515,562, a decrease of 19,554 as compared with the preceding year.

A Proposed New Art Gallery for London.

Negotiations are in progress for the purchase of premises in Old Bond-street as a gallery for the exhibition of works by members of the junior art clubs and societies. The premises stand on the east side of the street, and comprise what in the early years of last century was known as the Western Exchange; there is a rare coloured print of the spacious showrooms in the (old) Garden Collection.

The London Museum.

Mr. J. Seymour Lucas, R.A., has been known for many years as a collector of ancient costumes, many of which have been introduced from time to time into the roman pictures of this popular artist. Mr. Lucas has been persuaded to sell his collection to the London Museum, where they will be set to advantage in a few months' time.

A Patents Exhibition.

Steps are being taken for the establishment in London of a permanent exhibition of current patents, to which the public will have free access, and where they will be conducted through the different sections by experienced demonstrators and salesmen.

Carnegie Libraries for Manchester.

The Free Libraries Committee of Manchester have recommended the City Council to accept an offer made by Mr. Andrew Carnegie to provide 15,000l. for the purpose of erecting branch libraries in the suburbs of the city. If the report is adopted, it is probable that sites will be chosen in Withington, Chorlton-cum-Hardy, and Didsbury.

St. Andrews University.

At the forthcoming celebration of the 500th anniversary of the foundation of the University, the Senatus Academicus will confer the honorary degree of LL.D. upon Lord Balcarras, M.P., Sir George Frampton, R.A., Dr. Kenyon, Director and Principal Librarian, British Museum; Colonel Praeger, F.R.S., Director, Kew Gardens; Dr.

Chimneypiece in the Great Hall, Charterhouse.

From Mr. Godfrey's "A History of Architecture in London." (Mr. B. T. Batsford.)

Director, H.M. Geological Survey; Mr. Watts, F.R.S., Professor of Geology, Imperial College of Science; and Dr. Woodward, F.R.S., Keeper, Geological Department, British Museum.

The Trades' Training Schools.

The classes of the Trades' Training Schools, 3, Great Titchfield-street will reopen on September 11. Full particulars may be obtained from Mr. H. Phillips Fletcher, R.I.B.A., the Director. The Schools, which are under the jurisdiction of the Craftsmen's Companies of Carpenters, Joiners, Inter-Stainers, Plasterers, Tylers and Bricklayers, and Wheelwrights, provide instruction for those engaged in the various trades; the advantages of obtaining skilled tuition at minimal fees should induce every apprentice and workman to join the class for which he is eligible.

Westminster Abbey.

The work of restoring Westminster Abbey to its normal appearance has been completed. The Office of Works. Electric lighting, which was installed for the Coronation, is now in use.

Architects' Institute of the United Kingdom.
By invitation of the Hants, Wilts, and Dorset Branch, the annual country meeting of the Institute will be held on September 14-5 at Portsmouth, under the presidency of Mr. John Marks, of Messrs. Orgill, Marks, & Son. The Council will hold their autumn meeting on September 14 in the Town Hall; on the following two days visits will be paid to Winchester, Southampton, and the Isle of Wight.

Timber Cottages.

The Local Government Board has notified the Billericay Rural District Council that it will be prepared to consider proposals that timber-built cottages should be built for the use of workmen. It appears that there is some overcrowding in the district, the cause being, according to a local Councillor, the coming of so many London pensioners and tradesmen.

The Bridge Collection.

Mrs. E. E. Bridge, of Manor House, Piddletrenthide, Dorsetshire, is about to dispose of a collection of relics and works of art, owned by J. Bridge and J. Gawler Bridge, partners of the firm of Rundell & Bridge, of No. 32, Ludgate-hill, crown jewellers and gold-

smiths to George III. and his three successors on the throne. The collection includes some old silver and Sheffield plate, furniture, miniatures, and paintings, statuettes, models, and bronzes by Nollekens, Bailey, Canova, and Flaxman, and what are described as being the wrought-iron railings and scroll lamp-bracket from the former tomb in the choir, Peterborough Cathedral, of Mary, Queen of Scots, and another from the tomb (by Torrigiano, in Westminster Abbey) of the Lady Margaret, Countess of Richmond and Derby, mother of King Henry VII.

French Architecture Abroad.

Since the International Congress at Antwerp French architects have received numerous commissions from foreign places, notably from the American Republics. French professors seem to be in demand, too, in the West, and their presence there is likely to ensure further business relations between the countries. Is it possible that, by the judicious adaptation of British ideas to the requirements elsewhere, our own architects may secure some of the work of the future?

CORRESPONDENCE.

The Road Board.

SIR,—I notice in the last issue of the *Builder* a paragraph re the work of the Road Board. As a matter of fact, the Road Board are doing a great deal of very useful work in a very quiet manner, and their means, or rather the means at their disposal, are, as you say, very limited.

There are two aspects of the contribution question. The local authorities have initially the onus of maintaining their own roads, and the Road Board would be wrong in taking this responsibility off their hands, even in individual cases. It would almost become a competition who could make their roads the worst and show the greatest need for assistance. As the applications for assistance exceed the funds of the Board by about six to one, under the circumstances the policy of helping those who help themselves is a sound one. One advantage of the contribution system is that it ensures, at the least possible cost to the Board, their advice in the matter of roadmaking being listened to—a most important matter. The Board have under their personal observation almost every experimental section of road in the kingdom, and it

is becoming evident that the old methods of roadmaking (and maintenance also) were so extravagant that in a few years the annual saving from the improvements effected by the spreading of better information and the experimentally-established improved methods will represent so great a sum as to constitute in itself a potential fund by which the other more obviously-needed improvements can be carried out. It is a fact that an ordinary country road can be surfaced with macadam at about 1s. 4d. per square yard, with an extra 4d. a yard for tarring, total 1s. 8d., as against such figures as 2s. 4d. to 4s. often expended under identical conditions with no better results.

The position of the Road Board is that of a consultant called in to manage a badly-managed business; his first job is to cut down all extravagant and useless expenditure and add the savings so effected to his other resources for the ultimate improvement of the position. It is obviously bad management to spend money in building and maintaining new roads and extensions before the best method of road building and maintenance has been settled.

I believe that it is now ascertained that a road suitably built and with a waterproof surface, i.e., tarred, is, so far as rubber-tyred traffic (and nearly all motor traffic is rubber-tyred) almost a permanent job. I have heard that forty or fifty years is its estimated life. It is the horse vehicles and iron-tyred vehicles, including traction engines, that knock such a road to pieces, but even under average conditions the durability of roads under the aegis of the Road Board is being enormously increased.

With the colossal sums to be saved by proper construction being annually lost—irretrievably lost—it seems to me that there is no question as to the wisdom of the present line of action, and I think it is deplorable that the Press should take the superficial view they do as to the field for the activity of the Road Board.

F. W. L.

BOOKS.

A History of Architecture in London. By WALTER H. GODFREY. With 250 illustrations, maps, and lists of buildings. (B. T. Batsford. 7s. 6d.)

SINCE the time of Stow books on London have multiplied so rapidly that the fountain

Interior, The Orangery, Kensington Palace.

Vestry, St. Lawrence Jewry.

(From Mr. Godfrey's "A History of Architecture in London" (Mr. B. T. Batsford).)

of knowledge on the subject would have run dry but for the fact that something new can be said always about the past of a great city. During the centuries which have elapsed since the first encampment on the banks of the Thames the British race has shared enormously in the progress of the world, and while much has been given in the way of enterprise, much of artistic importance has been derived from other countries. The capital city of the Empire reflects, of course, changes in thought and the application of ideas; so the London of to-day may be likened to a vast museum containing evidence of almost every variety of artistic influence. In one decade there will be brought to light some early British or Roman remains which will alter or confirm the opinions of archaeologists; in another decade will arise such a building as the Byzantine Cathedral at Westminster to bring to Londoners the possibilities of an hitherto unrepresented style of architecture.

Such things would only appeal to the limited few if it were not for the guidance of those who devote time and energy to the task of explanation. London has been fortunate in its interpreters, and whether we read the whole-hearted phrases of Johnson, the incidental eulogies of Lamb, the systematic analyses of Besant, or inspired dissertations by such brilliant essayists as Mr. Henry James and Mr. Austin Dobson, we are conscious of the exceptional attractiveness which London possesses. If, however, we wish to penetrate intelligently into the architectural history of the Metropolis we may be pardoned if we choose as cicerone not a man of letters, but an architect well versed in the material side of the subject.

Mr. Godfrey has brought knowledge and

enthusiasm to his work, and he has diligently set down the very facts required by those who would learn or recapitulate. Wisely, he introduces his chapters with a glance at the remains of Grecian and Roman buildings, for "within a radius of a few miles of Bloomsbury lie enough examples of the work of past ages to afford a glimpse into the continuous history of architecture from 500 B.C. to A.D. 1900." and the general reader must be given an insight into the essentials of Classic architecture. The British Museum and South Kensington are rich in relics not only of Old London, such as the front of Sir Paul Pindar's house, once in Bishopsgate, and the panelled room from Clifford's Inn, but contain objects of extreme value and interest of other countries, of ancient days. Some early historical notes, therefore, are of importance in the story of London's architecture.

Norman architecture in London, illustrated by the Keep of the Tower and by the Temple Church, is the real beginning of the book, and from that period to the XIXth century Mr. Godfrey is the able guide who introduces us to the things we might pass by, perhaps, in ignorance—a hooded doorway here, a fine staircase there, each with its message of design, brings forward the richness of London in the details of architecture.

The book is addressed partly to a popular audience, and it fulfils its purpose admirably. There are occasional notes on construction, however, which will be of service to architects.

Mr. Godfrey has not hesitated to go outside the radius of London for illustrations. For instance, he includes Hampton Court, Waltham Cross, and Eltham Palace. Generally, however, the examples chosen are all within easy reach of the pedestrian, and no more profitable hours could be spent than

those devoted to the examination of buildings and decorations referred to by the author.

(London: T. Werner Laurie. 16s. net.)

FIFTY YEARS AGO.

From the *Builder* of September 7, 1861.

St. Mary Redcliffe, Bristol.

THE restoration of this noble church proceeds steadily and satisfactorily, though slowly, and more show is now made by comparatively small expenditure than was first the case. Amongst those who have interested themselves in distinct portions of the work, the Freemasons of the city of Bristol had undertaken the restoration of the north-east corner of the Lady Chapel, on the 28th ult. a grand assemblage of brethren took place on the occasion of laying the last stone of the part completed by them. They met, to the number of 500, in Exchange (Wood's fine building), marched thence in full dress, with band and music, to the church, where a choral service was performed and a sermon preached by the Rev. Brother Watkinson, Provincial Grand Chaplain, the church being crowded. The procession was then reformed and proceeded to the outside of the east end of the church, where the stone was laid by Masonic ceremony.

Friends' House, Croydon: Entrance Doorway.

The George Inn, Southwark.

From Mr. Godfrey's "A History of Architecture in London." (Mr. B. T. Batsford.)

EDITORIAL SUMMARY.

The suggestions drawn up by the Royal Institute of British Architects as a result of the Town Planning Conference last year form the subject of the leading article: "Civics and the Architect."

In the following article (p. 264) reference is made to the Blue Book recently issued on the Census of Production" (1907).

Notes (p. 265) include: "Architecture for the Masses"; "The Natural History and New Science Museums"; "St. George's Barracks"; "Rural Housing."

In his fifth article on "The Story of the Bridge" (p. 265) Mr. Shaw Sparrow traces the evolution of the timber bridge. Examples of constructive carpentry, in which mechanics and fine art were allied, are described.

Mr. Budden gives the history of "The Museo Barracco, Rome" (p. 268), an interesting modern example of polychromatic decoration in architecture.

Under Correspondence (p. 271) will be found letter on the work of the Road Board.

Mr. Godfrey's book on "A History of Architecture in London" is reviewed on p. 271.

Details of the Stockport Police Courts Competition appear on p. 273, and other competition news is given on p. 270.

The Monthly Review of Construction opens with a note on the "Second Report of the Joint Committee on Reinforced Concrete" (p. 275), this is followed by "Some Continental Ideas of Slating" (p. 276), and Notes.

In the Building Trade Section (p. 281) are notes on "Recent Workmen's Compensation Cases," "Increment Value," "Concrete Plant for Cold Weather," "Changes in Rates of Wages," "An Indian Mortar Mill," "Labour Disputes," and General Building News.

On p. 284 are illustrations of new buildings in connexion with the Hackney Union Infirmary, and an article on "The Royal Commission on Sewage Disposal."

MEETINGS.

FRIDAY, SEPTEMBER 8.

Institution of Municipal Engineers at Leam. - Victoria, 15, London Bridge, 9.30. Phoenix Ironworks, 11.0. At 10 leave for Salford, where Air Compressing Station, Erectors, and Refuse Destructor House, under construction, will be shown.

MONDAY, SEPTEMBER 11.

The Incorporated Clerks of Works' Association (Carpenters' Hall, London Wall). - Paper by Mr. C. S. Willis on "Hampson Court: Its Architecture and Associations." 8 p.m.

STOCKPORT POLICE COURTS COMPETITION.

THE result of this competition and the assessor's report were given in our issue of August 25, p. 216.

Professor Reilly adjudicated on the eighteen designs submitted by invited architects from all parts of the country, and the premiums were awarded as follows:—

First—Messrs. J. Theo. Halliday and Claude Paterson, A.A.R.I.B.A., of Stockport and Manchester.

Second—Messrs. Appleyard & Quiggin, of Liverpool.

Third—Messrs. Stott & Son, of Stockport and Manchester.

The competition differs in many respects from the ordinary, and reflects indications of much-needed improvements. We welcome, in the first place, a successful design which is based on monumental academic principles. Let us hope that the latent yearning for a more noble civic architecture which has for some time been making itself felt is at length going to bear fruit. Our large buildings have been too long the object of ridicule of American and Continental architects. We need an architecture that is permanent and lasting and Classic, in the true sense of the word, not a mere fashion of the moment that relies on meretricious tricks of draughtsmanship rather than breadth of conception and purity of detail. We have had enough of this paper stuff, enough of these short cuts to notoriety. The younger generation is surfeited with these pseudo-classic forms and ephemeral mannerisms.

There is no denying the influence of the Liverpool School of Architecture in this competition, particularly in the case of the first two designs, while many of the competitors have undoubtedly had its Sketch-Book in their hands. The part that the School has taken in the growth of monumental architecture in this country is too well known to need further comment.

Another new starting-point is a change in draughtsmanship. Instead of the coarse, thick line and blackened windows of recent years, it is gratifying to find a set of drawings of such refined and delicate rendering as that of Messrs. Halliday & Paterson. The elevations and sections are drawn in pencil and shaded. This, in fact, seems the only reasonable way in which to portray monumental architecture, and should, in competitions of this style, become more general.

It is satisfactory for once to find that the winning design is so pre-eminently the best that it leaves no loopholes for the assaults of discontented competitors, and both the assessor and successful authors will be spared the abuse which has been so sadly characteristic of recent competitions.

The problem was one of such complexity that only a small number of the competitors can be said to have arrived at a thoroughly satisfactory conclusion. A site of ample area has a frontage to Wellington-street, but the whole of the rear portion is at a depth of

25 ft. below the street level. Only a few of the competitors took full advantage of the architectural possibilities this afforded.

The winning plan is simple, straightforward, and workable. It was unfortunate that the conditions necessitated that the two main courts should vary in size, but, in spite of this, the plan is well balanced. Flanking the spacious entrance-hall are, on the one hand, the rooms for barristers and solicitors, and, on the other, those for witnesses. In one wing is a fine range of rooms for magistrates and jury, with a separate entrance, and in the other the police offices. The children's court is on the upper floor, while the cells are particularly well arranged at the lower level. The back elevation, of which a splendid view will be obtained, is unquestionably the most distinguished feature of the design. At the lower level is the police parade-room, a charming composition of five arches, with window infillings after the Adam manner, and a strongly rusticated central door. Behind this piles up the great central mass, with its fine wall surfaces and the bold line of the crowning cornice. The front elevation is, necessarily, owing to its lesser height, not quite so imposing though quiet and dignified. The central portico is flanked by lower wings, stretching out to the extreme ends, and behind the whole rises up the main mass, containing the courts. The central portico might be distinctly improved, and is the weakest part of the design. The pediment placed on a low attic is rather meaningless, and Doric columns might, considering the purpose of the building, be well substituted for the slender Ionic.

It is surprising that there is no echo in any of the designs of Old Newgate, that supreme example of architectural fitness, the grim, forbidding aspect of its walls having been termed one of the strongest deterrents to crime.

The designs placed second and third were, in comparison with the first, distinctly disappointing, particularly as regards the plans. Messrs. Appleyard & Quiggin's main front had quite a strong monumental feeling, but the 2-in. detail was immature, and did not do full justice to the ideas embodied in the small-scale elevation. The design of Messrs. Stott & Son had an ingenious arrangement at the main entrance, whereby two flights of steps led up to the courts and a central flight down to the charge-room. This would involve a somewhat promiscuous mixing of the various elements of society! The 1/2-in. detail was one of the best drawings in the room, being delicately rendered with pencil and wash.

The names were not attached to the other sets of drawings, so that we can only conjecture as to their authors. Two designs we judged those of Mr. S. B. Russell, and Mr. T. E. Cooper, and we fail to understand why one of these did not receive one of the premiums. The principal defects of an otherwise excellent plan were the extreme meanness of the main entrance, and the fact that some of the cells overlooked the parade-ground. The front elevation was not happy in its proportion, and was rather coarsely drawn, but

Accepted Design

STOCKPORT POLICE STATION AND COURTS

Kar for Wellington Street

the back took good advantage of the possibilities of the site. One design had a scholarly and dignified Doric front, charmingly portrayed, but it was unfortunately marred by a somewhat quixotic magnification of the ventilating flue into a huge shaft (shall we say tower?), which we fail to reconcile with the quiet Greek façade below it.

The main point is that the right scheme has won, and that it will raise the level of architecture in Stockport, and promises to be, in our opinion, the most noteworthy modern building in a town which has promoted quite a large amount of architectural energy of recent years, and we venture to congratulate the Corporation on having secured an unusually fine design.

ILLUSTRATIONS.

Edington Church, Wilts.

THIS church, dedicated to SS. Mary, Katherine, and All Saints, was connected with a small monastery of the Bonhommes, founded by William of Edington, who preceded William of Wykeham in the Bishopric of Winchester. It was commenced in 1532, and completed in nine years with the exception of the south porch, which was added a century later.

The church is cruciform in plan with a low central tower, and, in common with most monastic churches, a large chancel, which is more elaborate internally and externally than the rest of the church. The church is built of Bath stone, and contains fragments of XIVth-century glass, three canopied tombs of the XIVth, XVth, and XVIIth century, and a much-restored XVth-century screen. Of the monastery which lay to the north of the church there now remain the Prior's House, gardens, and fish-ponds.

These drawings by Mr. T. F. W. Grant,

A.R.I.B.A., were awarded this year the Measured Drawings Medal and 10*l.* 10*s.* of the Royal Institute of British Architects.

London County Hall.

THE County Hall, with which progress is being slowly but surely made, will attract more attention in the course of next year and thenceforward than it has done up to the present, although the operations of demolishing, excavating, and laying the foundations have not failed to interest passers-by since the work was started. Mr. Ralph Knott hopes that the superstructure will be begun during March, and as the building takes shape day by day citizens and visitors will find something more definite to appreciate or criticise. Meanwhile the river wall presents a formidable appearance. Mr. Leathart's drawing depicts one of the pair of bronze chain supports placed on each of the granite blocks flanking the central projecting portion of the Embankment front. The horses' heads, of which there are four, are slightly varied in design alternately, and have sweeping wings which are skilfully worked to a square measuring 3 ft. 6 in. Mr. Ralph Knott, the architect, is responsible for the design, and Mr. Gilbert Bayes is the sculptor of the supports.

An illustration of the revised design for the County Hall appeared in the *Builder*, September 10, 1910.

The Story of the Bridge.

THE illustrations of Bridges are in connexion with Mr. Shaw Sparrow's fifth article, which begins on p. 265.

King Edward Memorial Hospital, Ealing.

THIS hospital, which was recently opened by H.R.H. Princess Christian, is erected on a site fronting Mattock-lane. The pavilion, which is placed axially north and south, is two stories in height and contains on each floor eighteen beds

and one single-bed ward. The operating theatre adjoins the present and future ward and is connected thereto by a glazed corridor. The administration block fronts Mattock-lane and is three stories in height; the upper floors contain recreation-rooms and bedrooms for matrons, nurses, and servants. To the south of this block is a small casualty ward, a receiving-room, and beyond the kitchen office with boiler-house underneath. The sewer blocks are connected by a covered way, with the exception of the part before mentioned. A small provident dispensary is placed on the western extremity of the site, and behind it a space is reserved for the mortuary.

Provision is made to extend the hospital to accommodate fifty additional patients; this would entail completing the administrative block on three floors to the extent shown in outline on plan. The remaining parts of the hospital are designed on a scale sufficient to meet future requirements.

The building was erected at a cost of 17,000 by Mr. Walter Dickens, builder, Ealing, from the designs of Messrs. Hall-Jones & Cumming. The heating and electric lighting were carried out under the supervision of Messrs. Doll & Williamson.

ROAD REPAIRS.

Visitors to London and residents themselves have not failed to note the inconvenience caused by many roads being "up for repairs. Not everyone will give a thought to the cause of the trouble, which is, to a large extent, the unusual summer heat. Local authorities, prompted by their Finance Committees, are well aware of the extra expenses incurred, all of which, however, must be attributed to the effects of the sun in the year. For instance, Gloucester-place, which is costing about 4,000*l.* to repair, has provided for a long time a test for spring-tyres, and human endurance.

MONTHLY REVIEW OF CONSTRUCTION.

SECOND REPORT OF THE JOINT COMMITTEE ON REINFORCED CONCRETE.

NCE more the thanks of engineers, architects, and others making employment of reinforced concrete are to the Joint Committee organised by the Royal Institute of British Architects. Putting aside at an early date the prece which most engineers then cherished of reinforced concrete as a structural trial, the Institute were the first scientific in this country to recognise officially obvious claims of that material. Though their first Report, issued in 1907, not free from defects and omissions, it nevertheless possessed the great merit of setting in simple and intelligible form a series of data and rules for the computation of beams and columns which have been of practical value not only to architects, but also to public authorities throughout the United Kingdom, and to many of the firms have taken up reinforced concrete work in the last four or five years.

The second Report* is virtually a revised one of the first document, the chief additions and additions being in the data under the head of "Materials," in the "Methods of Calculation" (for beams), and in the section on "Pillars and Pieces under Thrust." A noteworthy section has been added on "Shear Reinforcement" (beams). We are glad to find that all of the modifications suggested at recent times in our columns have been in the text of the present issue.

As a matter of convenience to readers we have below with the various modifications a new matter *seriatim*, giving page numbers and other references for aiding identification.

In the first place, it may be noted that the constitution of the Joint Committee has been slightly altered by the substitution of Mr. Gibson Fleming for Colonel Mayne Major Paul, representing the War Office, by the inclusion of Messrs. F. Capon E. F. Etchells as representatives of the London County Council, and of Messrs. C. F. H. and W. G. Kirkaldy as representatives of the Concrete Institute, the former of these having previously been an unofficial member of the Committee.

The "Prefatory Note" is virtually identical with the section entitled "Report of the Committee" in the first Report. One of our readers will welcome the alteration of paragraph (e), p. 6, to read:—"In all cases a cover of $\frac{1}{2}$ in. on slabs and on beams is sufficient. It is undesirable to make the covering thicker." The corresponding paragraph in the first Report ended 1 in. on slabs and $1\frac{1}{2}$ in. to 2 in. on beams, a quite unnecessary requirement was not only bad from the practical point, but also inconsistent with the provision, given later in the same document, for the placing of reinforcement not more than $\frac{1}{2}$ in. from the surface of the concrete at any point, nor 1 in. in beams and $\frac{3}{4}$ in. in floor slabs.

Under the head of "Materials" an important addition in the form of a footnote (6) is:—"Coke breeze, pan breeze, boiler ashes ought not to be used for concrete. It is advisable not to use slinker or slag unless the material is freed with great care." These provisions are a welcome recognition of the standard in our columns against the persistent use of the residual products mentioned by writers who relied upon fire-resistance apparently were ignorant of the deleterious influence of coal residues on steel and concrete.

* London: The Royal Institute of British Architects,

of the instability of slag, to say nothing of the injurious elements usually contained in slags.

In Clause (7) occur the somewhat curious recommendations that "the proportions of the cement, sand, and aggregate should be separately specified in volumes" and that "the amount of cement added to the aggregate should be determined on the work by weight," cement being taken at 90 lb. per cubic foot. As weight is to be adopted finally, it would obviously be better to specify it in the first instance instead of asking the contractor to translate a percentage into weight by the aid of a coefficient, which is merely a rough approximation. The weight of Portland cement per cubic foot varies considerably with the specific gravity of the clinker and the fineness of grinding, and all architects and engineers who are wise will adopt the precaution of specifying the weight of cement that is to be added to stated volumes of sand and aggregate, for a given weight means a definite quantity of cement, and a given volume means cement and air in uncertain proportions.

Clause (8) paragraph (b) now states that the yield point of steel used as reinforcement should be "not less than 32,000 lb. per square inch," a provision more satisfactory and more exact than that in the former Report, where the elastic limit of from 50 to 60 per cent. of the ultimate stress was adopted as a criterion.

Paragraph (b) in the same clause is amended by omission of the unpractical and unnecessary "wash of thick Portland cement" previously recommended for the painting of steel bars before use.

Clause (9) now contains the timely advice that "No concrete which has begun to set should be used"—a point of vital importance, as known by all who have had any experience of reworked concrete.

The paragraph referring to hand-mixed concrete is the same as before. It would be improved by qualification to the effect that, as hand-mixing is less efficient than machine-mixing, the proportion of cement should be increased to make the concrete equal to that of material mixed by machine.

A footnote to Clause (10) emphasises the desirability of placing the full thickness of concrete in floor slabs in one operation.

In Clause (13) a very important and welcome alteration is to the effect that the strength of 1:2:4 concrete should not be less than 1,800 lb. per square inch at twenty-eight days, or 2,400 lb. per square inch at ninety days. The suggestion in the first Report that concrete of this relatively inferior composition should attain the compressive strength of 2,400 lb. in twenty-eight days has led to considerable misapprehension among architects and local authorities, which has tended in some measure to discourage the use of superior concrete.

Further attention to data connected with the strength of, and working stresses for, concrete materials are given in the succeeding section of the Report, entitled "Methods of Calculation," with which we will now deal.

In Clause (1) a footnote is added to the effect that the customary reduced estimate of floor loads should not be followed in the case of buildings containing heavy machinery, where the actual loads should be taken in full.

Clause (3), under the sub-heading "Beams," has been entirely rewritten, and is a great improvement on its predecessor. The clause now recommends that the bending moments for beams "must be calculated on ordinary statical principles, and the beams and slabs designed and reinforced to resist these moments." It also provides that where the

maximum bending moments in beams or floor slabs continuous over three or more equal spans and under uniformly distributed loads are not determined by exact calculation, the bending moments should not be taken at less than $+\frac{wl^2}{12}$ at the middle of the span, and $-\frac{wl^2}{12}$ at the intermediate supports.

This is a perfectly explicit statement in every way preferable to the former somewhat ambiguous wording, which was apt to be interpreted either as sanction for the moments $+\frac{wl^2}{24}$ at the middle, and $-\frac{wl^2}{12}$ at the supports, or as sanction for taking $+\frac{wl^2}{12}$ at the middle and $-\frac{wl^2}{24}$ at the supports.

It is now made clear that the value $\frac{wl^2}{12}$ is to apply throughout, but we should prefer the adoption of $\frac{wl^2}{10}$, in accordance with the practice of the best authorities and experts.

A new sentence in paragraph (c), p. 11, on stress distribution in reinforcing bars, points out that:—"In the case of steel of large section it may be necessary to consider the stress as varying across the section." While agreeing with this interpolation, we hope it may not often be needed, for the use of reinforcement in the form of large sections is quite contrary to the canons of reinforced concrete design.

Clause (5), entitled "Working Stresses," includes some welcome emendations. The first is that working stresses tabulated for concrete are on the basis of the crushing strength of 1,800 lb. per square inch at the age of twenty-eight days, instead of 2,400 lb. per square inch at the same age. The second is the abandonment of the unnecessary restriction of the limiting compressive stress in columns to 100 lb. less than that permitted in beams. No satisfactory reason has ever been assigned for the previous limitation, which seems to have been adopted at first by the Committee as a safeguard and in compliance with the recommendations of some American writers. The French Commission make no distinction of the kind. The third is that for steel in tension, with the tenacity of 60,000 lb. per square inch, the working stress is fixed at 16,000 lb. instead of 15,000 lb. to 17,000 lb. The new limit, being exactly half the stress at the yield point, is strictly logical. The fourth is that the compressive stress for steel is fixed at fifteen times the stress in the surrounding concrete, this numerical factor being governed by the value $E_s/E_c = 15$. The fifth is the specification of 12,000 lb. per square inch for the working stress of steel in shear. No recommendation was made in the first Report with regard to compressive and shearing stresses in steel. The sixth is an important improvement, for the working compressive stress in concrete mixed in proportions other than 1:2:4 may now be taken at one-third the crushing strength at the age of twenty-eight days, instead of one-fourth for beams and one-fifth for columns. In the case of steel the allowable tensile stress may be taken at one-half the stress at the yield point, but not exceeding 20,000 lb. per square inch.

The foregoing alterations will give considerably increased scope to designers of reinforced concrete structures, while guarding against the adoption of excessive compressive and shearing stresses in steel, as sometimes taken in the past. There is one point, however, which we are sorry to find has been left unaltered, namely, the limit of 60 lb. per square inch for concrete in shear in beams. Concrete in simple shear is quite capable of withstanding stress up to at least 50 per cent. of its compressive strength. The Joint Committee evidently have in mind, not shearing stress itself, but shearing stress as the measure of

indeterminable tension on diagonal planes in the concrete of beams.

Considering this aspect of the case, we cannot afford to disregard the results of well-authenticated tests which show that for concrete mixed in the proportions of about 1:2:4, the shearing stress of 100 lb. per square inch, or a little more, should be taken as a limit not to be overstepped without the risk of failure by diagonal tension.

Consequently the working stress, regarded as the measure of tension on diagonal planes, should not be more than 25 lb. or 30 lb. per square inch. In Clause (4), paragraph (b), p. 11, the Committee say:—"The resistance of concrete to tension is neglected, and the steel reinforcement is assumed to carry all the tension." Therefore, as the stress now in question is really tension and not shear at all, the resistance of the concrete ought logically to be neglected and steel applied to carry the stress. This is the practice of expert designers, and we should like to see it officially adopted, concurrently with a wider limit for simple shear considered on its own merits.

Turning now to beam equations, we regret to notice that, despite the statement of permissible stress for steel in compression, no formulae are included for the guidance of persons wishing to design beams with reinforcement in compression as well as in tension. Such formulae are clearly demanded for the three classes of beams covered by the series of equations relating to tension reinforcement only. Their omission in the second, as in the first, Report is distinctly unfortunate.

The equations now given in remodelled form on pp. 12 to 14 provide completely for the calculation of T-beams, where the neutral axis falls outside, T-beams where the neutral axis falls within the slab, and rectangular beams, a very convenient feature being the adoption of the standard notation proposed by the Concrete Institute. Another noteworthy improvement is the adoption of a more simple sectional area in the first class of T-beams as the basis for computing the proportionate area of tension reinforcement.

As before, the equations are based on the straight-line theory, and so involve nothing fresh from the theoretical standpoint. The only objection to them is the unnecessarily complicated aspect they present to the eye, and the labour their employment will involve in practical work.

It would be perfectly easy to express the same meaning in much more simple terms. As an example we take the equation, on p. 13, for the tensile resistance moment of a T-beam, where the neutral axis falls outside the slab. As written in the Report the equation is:—

$$R_t = b d^2 \left(s_1^3 + 4 m r s_1^2 - 12 m r s_1 + 12 m r \right) / 6 m (2 - s_1)$$

Now this can be put more conveniently in the same notation as follows:—

$$R_t = b d^2 \left[t r \left(1 - \frac{3 s_1 r_1}{6 r_1 - 3 s_1} \right) \right]$$

In the simplified form numerous repetitions of m , r , and s_1 are avoided, the result calculated for the term within square brackets is applicable to beams of any dimensions, and for approximate computations the value of the term within the small brackets, representing the proportionate length of the arm of leverage of internal forces, can be assumed at, say, 0.9, which is a fair average for ordinary beams. Moreover, the simplified equation lends itself conveniently to the preparation of tables and diagrams containing values from which the exact resistance moment for beams of any dimensions can readily be obtained by multiplication into the quantity $b d^2$.

No doubt those who are quite at home in mathematical exercises can perform the work of simplification for themselves, while there are many others who would be grateful to the Joint Committee for a simplified series of working rules.

The new section, entitled "Shear Reinforcement" (p. 14), deals with the important question of web reinforcement for beams. Subject to the reservation that 60 lb. per square inch as the working stress for concrete in shear does not provide an adequate factor of safety in respect of diagonal tension in beams, the procedure recommended is quite satisfactory, and the inclusion of rules for web reinforcement fills up a gap that was left open in the preceding Report.

We are glad to observe also that the section on "Pillars and Pieces under Direct Thrust" (p. 15) has been amplified by equations and data taking into account the valuable aid rendered by lateral reinforcement, which, properly disposed, raises the ultimate strength and increases the security against sudden failure by reducing (not preventing, as inadvertently stated in the Report) the lateral expansion of the concrete. The stipulation that an ample proportion of longitudinal reinforcement shall also be applied is wise, for, however great may be the value of lateral binding as auxiliary reinforcement, the longitudinal bars are always of primary importance both theoretically and practically.

The table of factors on p. 17 for different forms of lateral reinforcement will be found useful as a guide, but it is not improbable that the values there given may require modification when further experiments have settled more definitely the relative efficacy of helical, circular, and rectilinear binding for the core of reinforced concrete columns and struts.

The new subsection on "Working Stresses" (p. 18) contains features that should be widely appreciated. The recommendation of the safety factor of 4 at ninety days for all pillars is a further example of the recognition accorded elsewhere in the Report of the fact that concrete cannot be fairly judged by its strength at the tender age of twenty-eight days, and the table of working stresses makes quite plain the intention of the Committee that higher stresses are permissible for qualities of concrete superior to 1:2:4 mixtures. The specification of cement by weight in the same table is another commendable feature, as also is a footnote conveying the much-belated explanation in respect of 1:2:4 concrete at the age of twenty-eight days that "the limit of 2,400 lb. per square inch given in the previous Report of the Committee was adopted on the assumption that the cubes would be rammed with iron rammers under laboratory conditions."

The absence of this explanation has caused not a little inconvenience to reinforced concrete specialist firms during the past three or four years, especially when dealing with architects and engineers, who, with the object of being perfectly safe, have adopted the practice of interpreting literally the wording of the first Report.

The present Report concludes with a series of appendices, discussing various theoretical points raised in the text, and at the end is a tabular statement of the equations for singly reinforced beams. At the beginning of the pamphlet the notation adopted throughout is printed on a folding-plate which can be opened for reference while formulae are being studied.

Taken as a whole, this second Report marks a great advance, making clear several points previously capable of varying interpretation, and setting a more liberal standard for the employment of reinforced concrete, while providing reasonable safeguards for the protection of architects and their clients. It is to be hoped that when the Committee of the Institution of Civil Engineers have advanced to the stage of being ready to formulate recommendations, the Institution will be prepared also to co-operate with the Joint Committee in the establishment of regulations, and so obviate the inconvenience, at present threatened, of two independent and possibly conflicting codes dealing with reinforced concrete work.

SOME CONTINENTAL IDEAS OF SLATING.

By H. Y. MARGARY.

ON the Continent of Europe in general, and in France, Belgium, and parts of Germany in particular, there is, and has been from early times, a great love for slatted roofs. This elaboration applies not only to the way in which roof surfaces are built up by means of gables, dormers, turrets, chimneys, etc., but also extends to the texture of the roof surfaces themselves, these countries some charming effects produced by means of slates laid in a manner resembling the scales of a fish. There is a great variety of ways in which this can be produced. Three of these are shown in Fig. 1, that at A being perhaps the most known in this country; but the fact that each slate is fixed by one nail only renders a roof slated by this method somewhat noisy in a high wind, while it is also the case that the slates hang vertically upon the rafters. This arrangement does not seem to please the continental architect, who prefers general lines of his slating to run obliquely in gentle curves across his roof surface, as suggested in Fig. 2. For this reason more often uses slating of the types shown at B and C, Fig. 1. A doubling course of the eaves is required when slating as at A is used, but this is unnecessary with the other two types.

Interest is added to a roof by laying on two or lower courses with the edges of slates running in a different direction to the remainder of the slating. The simplest way to do this is to commence by laying a slat at a right-hand verge with the tail of the slat hanging the tilting fillet, as shown in Fig. 1, B, a piece of slate being laid beneath it where the roof boarding will be otherwise exposed. The remaining slats of the course are laid with the edges lap about 3 in. beyond the nail holes of the slates previously laid, the upper corners of slates being arranged to form a curve mentioned above.

Fig. 1, C, shows the slating commenced on a valley board, the right-hand slat of first course being cut so that it fits upon the valley board as hereafter explained.

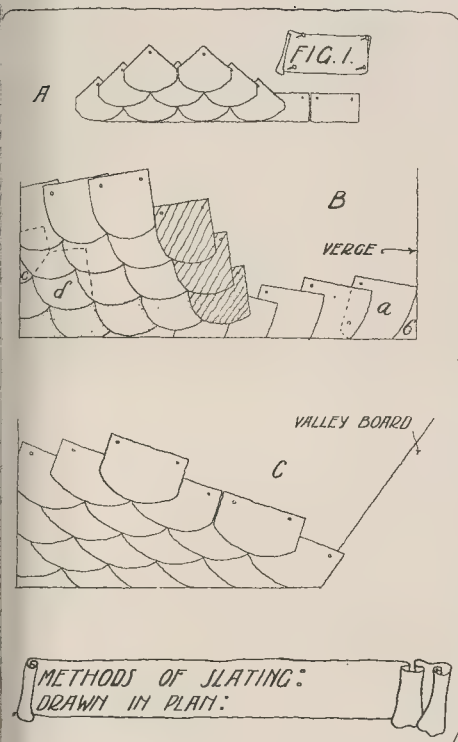

The second course is then laid so as to give a lap that is nowhere less than 3 in. Where the slates come against the eaves or verges they are cut off as shown.

Inconveniently small pieces will be obtained at the verges by cutting the slates only, but these may be avoided by cutting the end slate, as shown at C, Fig. 1, to the shape of the dotted outline, and cutting a corresponding portion off adjoining slate D.

It should be noticed that the slates may be laid in courses either across or up the roof, as indicated by the dotted and shaded shading respectively at Fig. 1, B.

It is usually most convenient to lay courses across the roof except near the verges, where, by laying the slates up the roof, any cutting and adjusting such as is shown at C and D is more easily performed.

Some charming effects are produced by forming all intersections of roof surfaces entirely in slate, i.e., without the use of lead, zinc, or other similar material. Fig. 3 shows a dormer treated entirely in slate. Fig. 3 shows the same dormer boarded ready to receive the slating. The dormer gable and cheeks may be of brick, batten, studding, or any other suitable material, making no difference to the method of hanging the slates, save that battens or fixings are necessary when the dormer is formed of any material that will not take the slates. It will be seen that boards are used across the valley at an angle of 45° to those between the main roof and dormer cheeks being cut to fit under the dormer eaves, and those between the main roof and dormer roofs having their upper ends mitred. These valley boards are from 6 in. up to

Some Continental Ideas of Slating.

in width according to the nature of the curve desired in the finished slating. The slates when laid are arranged as

SECTION THROUGH VALLEY.

FIG. 5.

shown in Fig. 4, narrow strips being used, as these conform readily to a quick curve. Fig. 5 is a section through a valley, showing

DIAGRAM SHOWING SLATING TO CONICAL TURRET ROOF & CIRCULAR VALLEY:

FIG. 6.

the arrangement of slates. The slates of the main roof are tilted up upon the valley board, and the valley slates lap over them,

ARRANGEMENT OF SLATES AT HIPS & RIDGE

FIG. 7.

while the slates of the dormer roof or cheek overhang the valley slates.

When a valley is curved on plan, as in

FIG. 8.

DIAGRAM SHOWING INTERSECTION OF RIDGE & HIPS:

Fig. 6, it is still carried up in a curve from the main roof surface, but in place of a valley board, which would be difficult and wasteful to cut and fit, short fillets are employed. These are nailed at 45 deg. across the valley, radiating from the centre of a circular turret, or, if the plan of the turret be other than a circle, normal to the curve on plan, the spacing being the gauge of the slating. On a turret roof the general arrangement of slates is the same as on a plane roof, but, of course, the slates must decrease in width and length, and the curved edge must be flattened towards the top so as to ensure a proper lap at every point, and so that the slates conform more closely to the increasing sharpness of curvature. If the slates were carried right to the top of the cone they would be so narrow that there would be insufficient horizontal laps to keep out the rain. For this reason lead is bossed over the upper part of the roof.

Ridges are formed of slates of the same thickness as the rest of the slates laid horizontally, as shown in Figs. 2 and 4, the top edge of the slates on one side being carried up higher than that on the other side so that the joint between them is covered, thus preventing the passage of rain. Fig. 7 shows a section of this. The same arrangement may be applied to hips, but it is simpler to cut the slates at the hips on one roof surface so as to overlap the slates on the adjoining surface, as shown in Fig. 8. Fig. 2 shows the intersection of a ridge and roof plane. Narrow ridge slates are used in this position so that they may be worked up in a curve over the mitred ends of the valley boards. As the curve ascends the angle between the two sides of the roof is flattened out so that

the uppermost slates lie flat on the main roof, where they are covered by the slates of the main roof.

For slate hanging the general arrangement of the slates is the same as for roof slating but the lap may be diminished if required.

Each course of slates on each mullion, Fig. 2, is composed of two slates, one rather wider than the other, so as to bring the joint to the centre of the mullion.

A straight course is shown below the valley of the dormer gable, but, of course, the gable may terminate with a moulded cornice with a barge board, as desired.

The slating on the dormer cheeks projects an inch or so beyond that of the gable wall so as to form a weather-resisting joint. Where the gable wall intersects the main roof the lower edge of the slate hanging is tilted forward, and is cut at each end to beneath the projecting edge of the slates to the dormer cheeks.

It is a prevalent custom to fix iron hooks in rows along the roof. These are fixed to the roof boarding by means of screws or nails preferably over rafters. Fig. 9 gives sketches of these hooks, A being designed for fixing at the ridge and B for fixing low down upon the roof surface. The beauty of a roof is considerably enhanced by the hooks, which are often beautifully wrought. The commonest form is made from a strip of iron with the exposed end worked into a scroll. The hooks serve as a fixing for the slater's scaffold when the slating is first laid and subsequently when repairs are necessary.

Fig. 10 shows a method of slating round chimney-stack without the use of lead. Here the front face and flanks of the stack are treated in the same way as a dormer, but the

A

B

FIG. 9.

ingement of valley boards and slating at back of the chimney calls for some planation. The upper ends of the valley rds *a a* are cut so that when fixed they at an angle of 45 deg. to the horizontal. o fillets such as *b* are spiked to the back he chimney at an angle of 45 deg. to the izontal, the upper edge of the lower end ng kept below the upper edge of the rd *a* by a distance equal to the thickness the roofing boarding so that when the ace *d* is formed its lower edge will be h with either upper edge of *a*. Next two ts are nailed to the roof at an angle of east 30 deg. to the horizontal, and the ace *d* is formed by nailing narrow boards ween the fillets *b* and *c*. The angle ween *d* and the main roof surface is d off by means of a tapered valley board. An arrangement of surfaces is thus ained, which tilts away from the back of chimney-stack, and is so gently eased t the slates may be easily laid upon them s to throw off the water.

t is best to form a gable at the back of y wide chimney-stacks with the valleys ned as already explained.

he ridge in Fig. 10 is formed as already lained.

he first two or three courses of slates at back of the stack are usually formed of row slates, but the remainder may usually of the same kind as used for the main roof, rather a larger lap.

ig. 11 gives a general idea of the appear- e of a stack with the surrounding slating hed off.

rojecting course of bricks or slates may sed to cover the upturned edges of the

slating round a stack, but when the stack is rough-cast the upturned edges of slate are covered with this material.

The explanation of these slating details is somewhat lengthy, but once the slater has seen work carried out as described above he will find no difficulty in actually performing the work himself.

CONSTRUCTION NOTES.

Mr. H. BURCHARTZ has made Frozen and experiments to determine the Rethawed effect of frost, if any, on the Mortar and subsequent hardening pro- Concrete. perties of cement, mortar, and concrete, these having been previously mixed ready for use:—

Cement.—Tests were made on two samples of cement, which had been prepared in the dry and wet ways respectively. The cements were mixed with water to a stiff paste, and the time taken for hardening to begin and for complete setting under the conditions stated below:—

(1) The cements were allowed to set under normal conditions.

(2) The cements were kept at nearly as possible at a temperature of 0° C. = 32° F.

(3) The cements were subjected to a temperature of -10° C. for three hours.

(4) The cements were subjected to a temperature of -10° C. for twenty-four hours.

(5) The cements were subjected to a temperature of -10° C. for seventy-two hours.

These frozen samples, viz., (3), (4), and (5), were, at the expiration of the hours stated, broken up with a hammer, and, after being allowed to thaw, were stirred for three minutes. The times for hardening and setting were measured from this point forward. It was found that preliminary freezing did not affect the times of hardening and setting. The samples

DIAGRAM SHOWING INTERSECTION OF CHIMNEY & ROOF SURFACE:

FIG. 10.

PLAN SHOWING BOARDING

PLAN SHOWING SLATING

kept at 0° C., however, were about four times as long as the others in reaching each stage. During the tests the temperature and humidity of the air were carefully noted. The same cements were used to make mortar and concrete.

Mortar and Concrete.—The mortar consisted of 1 part by weight of cement to 3 parts by weight of standard sand. The concrete was made up of 1 part of cement to 5 parts of gravel. Two classes of each were prepared, sufficient water being added to make the mixture in the one class (1) "earth damp," and in the other (2) "wet."

Test pieces were made (1) immediately after mixing, and (2) after subjecting to a temperature of about -14° C. (equal to 8-8° F.) for (a) three hours, (b) twenty-four hours, (c) seventy-two hours, and subsequently thawing. The test pieces were allowed to set under damp sand, some for seven days, and the remainder for twenty-eight days, and then tensile and compression tests were made.

The results showed that cooling for a few hours only had a negligible effect on the hardening of mortar and concrete, but that the rate of hardening was much lower after a prolonged freezing, this being strikingly accentuated for the "earth damp" over that for the "wet" mixings.

Testing Concrete and Materials for Reinforced Concrete.

The testing of reinforced concrete is under consideration and will form the subject of a later report.

Although the classified list of aggregates includes crushed slag, clinker, and coke breeze, we are glad to see a note to the effect that these are not recommended for reinforced concrete. The point is one which we have emphasised on several occasions during the past four or five years.

The accompanying diagram gives the result of a series of tests denoting the percentage of voids in various kinds of aggregates and sand. This diagram is interesting, but cannot be accepted as a guide in practical work where fragments and particles exhibit wide variations from time to time.

The deleterious effect of dust in sand is

DIAGRAM SHOWING PERCENTAGES OF VOIDS IN VARIOUS BALLASTS AND SANDS

EXPLANATION.—Each horizontal thick line represents the percentage of voids which

falls on the line. Numbers above figures are the percentages of voids in the sand.

The figures above figures are the percentages of voids in the sand.

clearly demonstrated by tests quoted in the report. According to these the compressive and tensile strength of 1:3 mortar made with granite and whinstone crushings, including all dust, is remarkably lower than that of mortar in the same proportions, but made with standard sand.

While accepting the tests for cement contained in the latest revision of the British Standard Specification, the committee advocate the adoption of crushing tests on 3-in. cubes of 1:3 mortar, the crushing strength to be not less than ten times the tensile strength at twenty-eight days required by the Standard Specification.

The standard recommended for steel may be thus summarised: Tensile strength, 60,000 lb. per square inch; yield point, 34,000 lb. per square inch; contraction of area at fracture, 45 per cent.; or elongation of bars not more than 1 in. diameter 25 per cent., on a length of eight diameters, the elongation for larger bars being fixed at 30 per cent. on a length of four diameters. The usual cold bending test is also included.

For determining the crushing strength of concrete the Committee recommend that tests shall be made on six 4-in. or 6-in. cubes in every case, three cubes being moulded in the laboratory and three on the works under construction, the concrete to be taken from the actual mixing plant.

It should be noted that the cubes can be made in metal moulds and the concrete worked in by pumping and tamping and afterwards gently rammed. Differences of manipulation will certainly be followed by variable results, and unless some standard mechanical contrivance can be adopted for filling the moulds we fear that misleading results will be unavoidable.

One very commendable suggestion is that specifications should provide for a provisional sum to be expended in the various tests required.

Rendering Linoleum Fireproof.

Mr. F. Fritz, investigating the properties of linoleum, has found that certain attempts to render linoleum fireproof by substituting asbestos, kieselsäure (sometimes spoken of as "fossil meal"), etc., for the cork-powder have not met with any appreciable success. On the other hand, good results have been attained by adding to the ingredients of the linoleum substances which when heated emit gases that would extinguish a flame. Suitable proportions he finds are:—Twenty parts by weight of cork-powder, 17 of linoleum cement, 8 of sodium bicarbonate, and 4 of ochre. The addition of the sodium bicarbonate does not have any apparent injurious effect upon the finished linoleum, and the temperature at which it decomposes is far above that of the kneading process. It is unnecessary to impregnate the jute basis with the salt, though in certain cases the fabric may with advantage be soaked in a weak solution thereof, and then dried. To find out how much "linoleum cement" is contained in a sample Mr. Fritz recommends a modification of the method suggested by Messrs. Ulzer and Baderle.

The last named technicians estimate by heating the finely-powdered material with benzene in a sealed tube at 150° C.; but

Mr. Fritz finds that the "cement" is not completely dissolved by this treatment, and that better results are obtained if, after heating, the residue is extracted with a mixture of benzene and chloroform.

The nature of the residue may be qualitatively, and in some measure quantitatively, determined by a subsequent microscopic examination.

Testing Materials of Construction.

WITH a few notable exceptions, the testing of structural materials has not been undertaken systematically in this country, either by Government or by scientific societies. There was once, and perhaps may still be, a comatose British section of the International Association for Testing Materials, but for some reason this organisation never seemed to flourish. In the United States a similar branch has blossomed out into an independent society of continued vitality and activity. This is shown by the annual meeting held under the presidency of Dr. H. M. Howe at Atlantic City in July last, when 450 members and visitors were present, the total membership of the Society being 1,400 at present. A new stage of development is indicated by the evidences of systematic work conducted by numerous committees and sub-committees by whom various classes of material have been under consideration during the past year. Many important progress reports, completed specifications, and papers were submitted at the annual meeting.

Sound-Resisting Walls and Ceilings.

A METHOD recently devised in Germany for rendering walls and ceilings capable of effective resistance to sound transmission is illustrated diagrammatically in the accompanying sketch.

Under the ceiling or soffit of the floor, or parallel to the wall, as the case may be, a network of wire is stretched tightly by means

Sound-Resisting Walls and Ceilings.

of pulleys, secured as at a into the adjacent walls, and not touching at any point the surface to be protected against sound. Then upon the wirework is plastered a composition formed of strong glue, plaster of Paris, and granular cork, so as to make a flat slab between wall and the wall or ceiling is a cushion of confinement.

The inventor points out that the arrangement is advantageous in the case of ceilings of fire-resisting floors which, although otherwise excellent, are characterised by excessive sonority. He also draws attention to the fact that sounds are often transmitted from one part of a building to another, and from adjoining buildings through contiguous walls. This contention is undoubtedly correct, and those who undertake to provide against the conduction of sound will do well not to neglect their efforts to the treatment of floors.

The method described is good in respects:—(1) The absence of contact between the protective and protected surfaces; (2) the colloidal nature of the composition recommended for plastering.

Reinforced Concrete Notes.

THE use of reinforced concrete is rapidly extending, encroaching on the province of other materials. Several years ago reinforced concrete was tried in the form of sleepers by an English railway company, and the result was satisfactory. Now the companies—the London and North-Western, Great Northern, and the Great Eastern—have utilised reinforced concrete for fence posts. A well known, creosoted wooden posts require renewing, their life not being more than twenty years. On the other hand, reinforced concrete has a much longer life, being in fact practically imperishable, so that, even if its cost is greater, its advantages counterbalance its first economy. The cost of such posts runs at about 6½d. a foot lineal, and in cases where cement, iron, and sand are cheap locally the cost of reinforced concrete posts is less than that of creosoted wooden ones. Similarly for the use of reinforced concrete is a boon to the farmer. Posts, drinking-troughs, channels, and a variety of other parts about the farm can easily be made by the farmer himself in his spare time, and especially in the case of cast drinking-troughs greater cleanliness is obtained.

Economy in Building by Use of Terra-Cotta.

THE use of terra-cotta in the State Educational building, Albany, N.Y., in place of marble in the decorative features, it is claimed, enabled a saving of 100,000 to be made in this building. The plain parts of the building and the shafts of the twenty-eight columns which are employed have been executed in marble, the decorative parts, including large Corinthian capitals, have been made of terra-cotta glazed to a colour to match the marble work.

The cost of these capitals, which are 80 to 10 ft. high, is said to have been 89¢ each, against an estimated cost of the same in marble of 480¢ each, a saving on the capitals alone of roughly, 11,000¢.

THE BUILDING TRADE.

RECENT WORKMEN'S COMPENSATION CASES.—I.

Arriving At and Leaving Work.

WE have from time to time suggested certain principles which would assist in enabling employers and workmen to determine when the employment commences and ceases, and, consequently, when they are within the Workmen's Compensation Act. We may refer in particular to the articles in the *Builder*, number 2, 1907, and August 27, 1910. Recent cases serve further to illustrate the principles enunciated in the November 2, 1907. We then laid it that, "although not absolutely at the place where his work has to be performed, a workman arriving at or leaving premises which are under the control of the employer for the purposes of getting to or from his work will be deemed still to be in the course of his employment if he is furthering the employer's interests," and in that case and the article of August 27, 1910, illustrated that proposition by reference to decided cases.

In two recent cases make the matter clearer. In *Gilmour v. Dorman, Long & Co., Ltd.*, a workman employed at steel works elected to go to his work across a footpath which traversed some land of his employers, but which necessitated his walking no part of his journey to the works along a railway line. He slipped and was injured on the land belonging to his employers. The Court of Appeal held that he was injured "in the course of his employment." The employers could not authorise him to reach by a route which necessitated trespass on the railway line and there was an alternative way he could have selected. The Court of Session have come to a similar conclusion in the case of *McLaren v. Caledonian Railway*, where a man in the employ of the railway company started to traverse the railway instead of walking down a road which connected two places at which he was employed. These cases well illustrate the meaning of our article August 27, 1910, that a man, if he approaches or leaves by a route within the contemplation of parties will be within the contract of employment, but not so if, for his own convenience, he is taking an unauthorised route over his employer's premises.

Continuous Employment, or Employment Implying Residence on Premises.

When the employment is continuous, or involves residence on the employer's premises, the principles apply. We treated on this subject of the law in articles January 9, 1909, and 13, 1910, but one or two recent decisions further illustrate the problem. If an employee has to return to the premises, and is injured by the recognised means of access to the premises, he will have met with the accident "in the course of his employment." In *Moore v. Manchester Liners*, the Court, August 13, 1910, provided, that he had not committed a breach of contract by being absent at a wrong time or on leave. If he is away with leave, but is on his own business, it is essential to prove that at the time the accident occurred, he reached his employer's premises or some place of access to the same under their contract. The accident will not arise out of his employment (see the decision of the House of Lords in *Kitchinham v. Owners of the S.S. "Thamesburg"*). If he is on his employer's premises he is continuously under the Act, provided, of course, that he runs no unnecessary risk outside the scope of employment.

INCREMENT VALUE.

Some recent correspondence in the *Times* on the Administration of the Finance Act 1909, very uncertain nature of increment value has been exemplified by the divergent expressions. One correspondent, writing to the House of Commons, has even gone so far as to declare that house property, apart

from the land upon which it is built, can never increase in value, and that as long as the cost of labour and materials remain the same, the supply being unlimited, demand can have no effect on its value. He argues from this that land is the only factor that can appreciate, and the value of the perishable article, the house, having been found, the value of the land can easily be determined.

There is unfortunately too much ground for thinking that the valuation officers proceed on some such view as this in making their valuations. They consider the bricks and mortar to be perishable, and when an occasion arises treat any difference shown between the original valuation and the valuation on the occasion as attributable to a rise in the value of the land. This may be very well on paper, but how does it strike the ordinary builder? Lord Sheffield has pointed out that fashion may affect the value of house property quite apart from any fluctuation in the value of the land, and we think all builders will endorse his view. Under the Finance Act fashion or demand is attributed entirely to site value, but we think the fallacy of any such contention may be exposed by considering the case of houses of a particular character. Of late years there has been a demand for houses of any definite period, such as Elizabethan houses, Georgian houses, etc. Houses in the neighbourhood of such a house of character may have depreciated, but a fancy price will be given for a house of genuine antiquity. What has the value of the land to do with this? The land, owing to encroachment of buildings of an undesirable character, may have depreciated, but the demand is for the house itself. Yet if the principles above enunciated be applied to such a property a sum for depreciation must be written off, which would leave hardly any value at all, and the high price obtained for something in the nature of a curio would be attributed entirely to the land. Such a case shows the injustice of this principle of taxation, and it is highly erroneous to exclude the question of demand. A house may be suitable for some particular purpose, and its adaptability to this purpose forms part of its value entirely independent of the value of the site. There appears considerable risk that the depreciation written off buildings will in every case be added to the site value, in which case owners of a wasting property will be taxed not on increment, but on depreciation. The whole subject certainly calls for a strict and impartial inquiry at the hands of competent persons.

CONCRETE PLANT FOR COLD WEATHER.

ALTHOUGH severe frost rarely prevails in Great Britain for long periods, the plant and arrangements described below will probably furnish some useful hints to contractors engaged in concrete work both in winter and in summer.

The methods in question were adopted by the Newton Engineering Company of Milwaukee for building a three-story warehouse,

64 ft. by 112 ft. in plan, having a reinforced concrete skeleton with brick curtain walls.

We give a sketch plan showing the arrangement of the plant, which comprised an electrically-operated concrete-mixer discharging directly into the bucket of an electric hoist consisting of a sectional steel tower with guides and head-frame for operation of the bucket-shaped cage. A special feature of the hoist was the manner in which the lower part was carried horizontally so as to cause the cage to pass under the outlet of the mixer so as to receive the concrete without involving the use of intermediary appliances. In addition to saving the cost of unnecessary handling this method possesses the recommendation of reducing to a minimum the period elapsing between the mixing and deposition of the material.

The electrically-driven gear for operating the concrete hoist was provided with an extra winding drum for transporting trucks of material running on the 24-in. gauge track shown in the plan, and for rendering other aid.

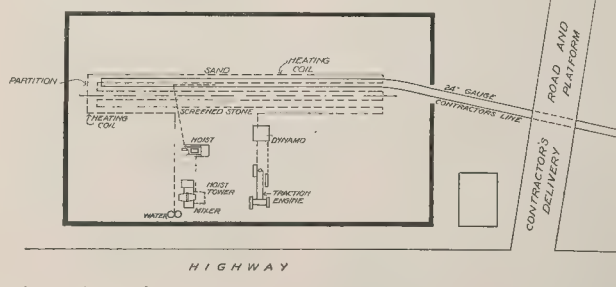

Beyond the concrete plant proper the contractors provided a 5-h.p. electric hoist for dealing with materials, such as brick, mortar, timber, and steel. In addition an electrically-driven circular saw bench was laid down for preparing timber used in the construction of moulds.

As electric power was not available on the site of the works the contractors generated the requisite current by the aid of a 13-h.p. dynamo, driven by a 20-h.p. traction engine.

Materials were brought to the site by a road shown at the right-hand of the plan, the waggons being driven up an inclined timber platform through trap-doors in which their contents could be discharged into trucks running on the contractor's track beneath, the latter being laid on an inclined trestle. The trucks employed were of special design, discharging by a hopper bottom and a side outlet. The contractor's line inside the building was carried by a trestle similar to that outside and close to a partition dividing sand from aggregate.

When the truck was used for delivering gravel a screen was attached below the bottom outlet, the result being that sand found its way through the pebbles to one side of the partition, while the screened pebbles rolled over and collected on the other side. In order to prevent the sand and aggregate from freezing steam pipes were laid on the ground beneath the material heaps, and supplied from the boiler of the traction engine. Exhaust from the coil was led into the vessels used for the supply of water to the concrete-mixer.

The procedure followed by the contractors was generally as described below. While the moulds and brick walls for each story were being erected, concrete materials were delivered and transported on the contractor's track to the interior of the building. The steam coil was kept hot so that the sand and stone should be thawed and remain warm until sufficient was collected for the concrete of an entire floor. When all was ready the operations of mixing and depositing concrete were commenced and continued without cessation until the entire floor was completed, thus obviating the bonding of old and new work. As the flooring was

Concrete Plant for Cold Weather.

completed the surface was protected by canvas, this protection, in conjunction with the use of salamanders below the moulds, salt in the water, and warmed materials, eliminating all the troubles usually accompanying the execution of concrete work in frosty weather.

While the building was under construction the temperature for at least fifty days was below 15 deg. F. all day, and sometimes fell to below zero. The erection of this building under severe weather conditions with results stated to compare favourably with those obtained in warm weather shows that with suitable precautions reinforced concrete work is entirely practicable at low temperatures, but it must be borne in mind that the cost is considerably above the average.

CHANGES IN RATES OF WAGES: BUILDING TRADE.

THE eighteenth report of the Board of Trade on changes in rates of wages and hours of labour contains some statistics of considerable interest at a time when public attention has so forcibly been drawn to the question of the workman and his hire. In considering the figures presented in these reports it is essential to bear in mind that the changes in wages referred to are changes in the rate of remuneration of a certain class of workpeople apart from any change in the nature of the work performed. Thus the figures relate only to changes in rates of wages quite distinct from earnings.

In the fifteen years 1896-1910 there have been eight years with rising and seven years with falling wages, but the net effect has been an increase of 353.985*l.* in an ordinary week's pay.

1908 and 1909 were years of falling rates of wages representing respectively decreases per week of 59.17*l.* and 68.92*l.*, but 1910 showed an improvement, with a net increase of 14,534*l.* These being general figures, we may turn more particularly to the building trade.

The report states:—"Employment in the building trades continued slack in 1910, and although the percentage of trade union members unemployed showed some improvement on the previous year, the industry generally remained depressed."

This statement supports our comment (the *Builder*, May 26) on the Budget statement of the Chancellor of the Exchequer, when he represented the building trade to be participating in the general prosperity of the country, and, as we contended, took too favourable a view of the conditions prevailing in this trade.

In the year under review, 1910, the net result of changes in the rate of wages is an increase per week of 37*l.*, as compared with a decrease in 1909 of 71*l.* The number of workpeople affected by any change was, however, only 4,970, or 0.5 per cent. of the number employed. The changes were effected as to 27 per cent. of the persons involved by conciliation and arbitration, and it is particularly worthy of attention that, as regards 4,752 persons, the changes were effected without strike, and only as to 218 persons after a strike.

The net result of changes in hours of labour was a reduction of 4,208 per week, and 12,918 workpeople were affected. The changes were attained by conciliation or arbitration as to 21 per cent. of the persons involved, and only in the case of 109 persons was striking resorted to before the settlement was attained. In this respect the building trade—a most depressed industry—continues to show a good example to far more prosperous trades.

This report does not deal with the amount of employment or unemployment. The figures published in the *Board of Trade Labour Gazette* for July showed some improvement, but the returns made to the Board of Trade, as we have pointed out frequently and as was recognised in the Actuarial Report on the Insurance Bill (see the *Builder*, May 26), only apply to certain classes employed in the building trade, and are an imperfect guide as to the conditions prevailing in the trade as a whole.

A DECEASED BUILDER'S ESTATE

The late Mr. George Boxall, of Hazelhurst, Pangbourne, Berks, builder and contractor, has left estate of the gross value of 24,157*l.*

An Indian Mortar Mill.

AN INDIAN MORTAR MILL.

THE accompanying illustration depicts an Indian mortar mill, in which the mortar is ground and mixed under a heavy stone roller, which is pulled round in a circular trough by a pair of small bullocks. The trough is only a little wider than the roller, which squeezes much of the mortar out on to the ground on each side. This is scraped back into the trough by a woman coolie, who follows the roller round and round, using a "mamoty," or hoe. In Southern India the roller is usually made of hard gneiss, blocks of which, intended for the same building as that for which the mortar is being prepared, may be seen at the left-hand side of the picture. Very good mortar is made by this machine, which is supremely efficient as regards the application of the power. Almost the whole of the resistance to the pull of the bullocks is that due to the performance of the work of mixing and crushing, and the return of the material by hand results in better mixing than that which would be effected by any but a very complicated mechanical device. Slow movement for men and animals is less tiring than standing still, and the friction of the machine is very small indeed.

A BILL RELATING TO LABOUR DISPUTES.

A BILL has been introduced, presented by Mr. Crooks and supported by members of various parties, to deal with labour disputes, which is deserving of some attention, as its object is to foster conciliation and to obviate disastrous strikes and lock-outs.

The Bill contains forty-six sections, and it is not our intention to examine it in detail. It provides for the constitution of conciliation boards to be appointed by the Board of Trade, consisting of three members—one to be appointed on the recommendation of the employers, one on the recommendation of the employees, and the third on the recommendation of the members so chosen. The expenses of these tribunals would be defrayed out of moneys provided by Parliament. This being the case, it is a matter for comment that the Bill contains no provisions enabling them to enforce their awards, unless, under clause 37, the parties agree in writing that they shall be legally enforceable.

The most important clauses are 32 to 36, which have for their object the prevention of any strike or lock-out prior to, or pending a reference to the tribunals, and imposing penalties for a breach of these provisions. This seems a step in the right direction if such penalties could ever be enforced, but since the Trade Disputes Act the trade unions, the real parties to strikes, are immune from proceedings, and cannot have their funds attached.

The intention of these clauses appears to be to render a reference to arbitration a condition precedent to the right to lock-out or to strike, but as the reference to arbitration is optional, this intention might be expressed

in clearer terms. Besides this, as "disputes" is defined in the accepted sense of a difference between an employer and his employees, Bill would appear to have no application where there is no such difference, but men come out, or are locked out, because of disputes between other employers and employees, i.e., in the case of general strikes. Therefore, although the Bill is worthy of attention, it appears hardly adequate to meet the "present distress."

GENERAL BUILDING NEWS.

CHURCH AT WOODSEATS, SHEFFIELD.

This church, to accommodate 600, is in the erection from the designs of Messrs. C. M. Hadfield. The estimated cost is 7,200*l.* The whole building will not be complete, however, until financial considerations have been overcome.

BAPTIST CHAPEL, PORT TALBOT.

The Calcaria Welsh Baptist Chapel, Port Talbot, was opened at the end of last month by the designs of Messrs. Evans & Jones. It was designed by Messrs. Evans & Jones and Messrs. W. P. & E. Williams were contractors. The building is of stone, and the cost was 1,100*l.*

SCHOOL AT GABALFA.

An infants' school, designed by Mr. Pugh-Jones, of Cardiff, has been inaugurated at Gabalfa. The cost of the building is 2,805*l.*, accommodation being provided for scholars. The contractors were Messrs. K. & Wells, of Cardiff.

NEW SCHOOL, NEWCASTLE.

A new school has been erected at Foss Hall at a cost of about 4,000*l.*, from designs of Messrs. Hope & Tasker, architects. The contract was carried out by Mr. J. W. High Barnes Works, Sunderland.

SCHOOL IN WEST FIFE.

Owing to the construction of the Royal Naval Base the village of Limekilns has been peopled to such an extent that a new school was considered necessary by the Dunfermline School Board. Accordingly the building, cost 7,000*l.*—has been begun. The architects are Messrs. Hyslop, Ure, & Beveridge, Dunfermline. The following firms and individuals are also at work on the school: Contractors and builders, Messrs. James Stewart & Sons, Dunfermline; joiner, George Lawrie; plumbers, Messrs. Thomson & Co.; slater, Mr. John Robertson; plasterer, Mr. John Lambert; heating, Messrs. Mackenzie & Moncur; ventilation, Messrs. Donald & Donald; smith work, Messrs. Bonnar & Son; painters, Messrs. Hoggan & Son.

NEW SCHOOL, FOR PENZANCE.

A site near the Public Buildings has been acquired by the Borough Education Committee, who proposed to build on the land a school to meet the demand of the neighbourhood.

INFANTS' SCHOOL, SALFORD.

Mr. J. B. Broadbent, A.R.I.B.A., is architect of the infants' school in course of erection in Robert Hall-street, Trafford Park, Salford. A memorial stone was placed in position last week.

ELEMENTARY SCHOOL, STOWMARKET.
is proposed by the East Suffolk County Council to provide school accommodation for about 600 children, and a site has been fixed at Stowmarket.

SCHOOLS AT WEST BROMWICH.
Schools, designed by Messrs. Wood & Brick, have been built at Hill Top, West Bromwich, on a site formerly occupied by the "Hollies," the residence of the late Alder- Wilson, who interested himself in the education arrangements. There are four classrooms, for boys, girls, junior mixed, and infants, each section accommodating 320 pupils. The cost of the schools was £13,860, inclusive of equipment.

EXTENSION OF TUBES, LONDON.
Messrs. John Mowlem & Co., contractors, of London, are to execute the construction of a new tube from Paddington tube, and the extension from Charing Cross to the Embankment for the London United Electric Railways.

PORT GLASGOW STATION.
The new passenger station was sub- commenced recently at Port Glasgow. Town- Council, and it was decided to assist the Glasgow Railway with their scheme. The new station leading off Princess-street forms an access to the new station.

BUILDING IN LIVERPOOL.
According to the report of the Building Surveyor, beat no records for building in 1910. Indeed, except in the Walton ward, there was a substantial diminution of building. The 1,710 houses erected was a decrease of 439 than in 1909, and 396 below average of many years. The reason lies in the advent of the garden city of three and a half acres, which has diverted funds within the city boundary.

PAY OF BUILDERS' LABOURERS.
The employers in the district of Salford have asked to give to labourers engaged in building trade an immediate advance of 1s. 6d. in the amounts desired being a fixed sum of 6d. an hour for all general labourers, including excavators, 6d. per hour for hod-carriers, and 7d. per hour for masons, mill men, iron fixers, and other labourers. It appears that many firms pay such wages to certain of their labourers, and it is probable that there will be difficulty in adjusting the matter. Con- siderable who have based their estimates on the current rates of pay, may, however, seek to increase the alteration.

SEASHORE, KNOTT END, FLEETWOOD.
The esplanade is being made at Knott End the plans of Mr. T. A. Drummond, Surveyor to the Quail Holme Estate, and Mr. Monk, Surveyor to the Presall Urban Sanitary Authority, have been suggested for years but it is only recently that the local interests have been brought forward. The length of the esplanade will be 1,000 yds., and its width will range between 100 and 110 ft.

HOUSE COLLAPSE IN THE WEST END.
The site of a building, recently shored up in Great Portland-street, was cleared a house adjoining, though up, collapsed, and the workmen but- tress escaped.

TRADE NEWS.
In the direction of Messrs. N. W. Harri- son, R.I.B.A., and G. A. Harrison, M.S.A., the "Boyle" system of ventilation, embracing Boyle's latest patent "air- ventilators and air inlets, has been applied to George-street Congregational Church, Oxford.

Mr. Stanley Jones & Co., whose factories at Salford's Bush have been extended by 15,000 sq. ft., have just secured the order for the installation of showcases, etc., in the premises of Messrs. Katz Brothers, Ltd., at 10, Abchurch-lane. The amount of the contract is £2,000.

New Hospital, Atherstone, is being designed with Shorland's warm-air ventilating system. Manchester stoves, by Messrs. E. H. and Brother, Ltd., of Failsforth, Lancashire. Messrs. O'Brien, Thomas, & Co., Upper Portland-street, London, and Excelsior Works, Birmingham, have recently supplied for their D. O. Boyd's roof ventilators for new dining and refreshment rooms at the new hospital being erected at King's Cross, the contractors being Messrs. Hall & King, of the Lynn. The two lifts are carried out by the Lift and Hoist Com- pany, Premier Engineering Works, Deptford,

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABEYDORE.—Repairs to parish church (470l.); Rector of Abeydore.

Aberdeen.—Additions to slaughter house, Hutcheon street, for the Aberdeen Flesher Incorporation.
Aberystwyth.—Parish hall; Churchwardens, St. Michael's, Aberystwyth.
Billingborough.—Alterations and improvements at the Vicarage; the Vicar.
Bingley (Yorks).—Public baths, Myrtle-park; Mr. H. Bottomley, Surveyor, Bingley Urban District Council.

Birmingham.—Sanatorium, near Birming- ham; Messrs. Martin & Martin, architects, Colmore-row, Birmingham; Messrs. Lowe & Son, builders, Burton-on-Trent. Additions, Ansell's Brewery, Messrs. Lusk & McKenzie, architects, Bedford-row, W.C.; Mr. W. J. Whittall, builder, Lancaster-street, Birming- ham. New ropeworks for Messrs. Wright; Messrs. R. Fenwick, Ltd., builders, William Edward-street, Birmingham.

Bispham.—School chapel; Trustees of the Bispham Congregational Church.

Blaengarw.—Hall (1,000l.); Vicar, St. James', Blaengarw. One hundred houses for the International Coal Company, Blaengarw.

Blowick.—School (7,000l.); Mr. L. Maggs, architect, Shire Hall, Nottingham.

Bolton.—Extensions, Townley's Hospital (30,000l.); Mr. H. I. Cooper, Clerk, Board of Guardians, Bolton.

Brigg.—Alterations to factory for Messrs. Spring & Co.

Broughton (Manchester).—Extensions to North Manchester New Church, Bury New- road; the Vicar.

Burbage.—Institute, Bishops-lane (1,612l.); Messrs. Robinson Bros., builders, Burbage.

Collington.—School (1,000l.); Mr. W. J. Martin, builder, Drakevale.

Cuckfield.—Parish hall; Rev. J. L. Stewart, Cuckfield.

Darnley.—Home for nurses (5,500l.); Mr. H. Clough, architect, Rochdale; Mr. R. Kay, builder, Rochdale.

Dowlais.—Proposed extensions to Wimborne baths; Mr. T. F. Harvey, Surveyor, Merthyr Tydfil Town Council.

Dundee.—Training college, Park lane (60,000l.); Mr. F. M. Cappon, architect, Bank- street, Dundee.

Durham.—Hall (1,020l.); Pastor, Presby- terian Church, Durham. Extension to Union Offices (840l.); Mr. C. B. Smith, care of Mr. H. E. Ferens, Clerk, Board of Guardians, Durham.

Durrington.—School; Mr. J. Powell, County Hall, Trowbridge.

Eastbourne. The following plans have been passed:—Marine Hall, Seaside, for Mr. J. Stainley; Mr. Andrew Ford, architect. Addi- tions, "Holyrood," St. Anne's-road, for Mr. J. K. Brydgos; Mr. P. D. Stonham, architect.

House and garage, Pridaux-road: Messrs. Peerless-Dennis & Co., builders. Additions to premises, Lisimore-road, for Messrs. Bobby & Co.; Mr. Andrew Ford, architect; Messrs. M. Martin & Son, builders.

Four houses, Desmond-road; Mr. A. Chandler, architect; Messrs. Ford & Pellett, builders.

Reclis.—Three houses, Corporation-road; Messrs. Thomas Moore & Son, builders, 22, Monton-road, Eccles.

Edinburgh.—Ice rink, West Tollcross, for the Edinburgh Ice and Cold Storage Company, Ltd.

Embsay.—Church, Moor-lane; Architect, care of the Swedenborgian Trustees.

Falkirk.—Board-room, etc., Dalders-avenue (1,800l.); for the Bainsford and Grahamston Co-operative Baking Society.

Ferryhill.—Alterations and extensions to club for the Ferryhill and District Workmen's Club.

Freckleton.—Bank premises, The Green; architects, care of the Directors, Manchester and Liverpool District Bank.

Frinton-on-Sea.—Free church (4,500l.); Mr. W. Hayne, architect, Frinton-on-Sea; Messrs. Potter & Son, builders, Chelmsford.

Gellifaelog.—Proposed 300 houses; Mr. T. F. Harvey, Surveyor, Merthyr Corporation.

Gerrard's Cross.—Bank; Architects, care of the Directors, Messrs. Barclay & Co.

Golear.—Additions to Heath House Mills for Messrs. Thorpe.

Greenock.—Alterations to the West Parish church; the Pastor.

Halifax.—Improvements to the Crossley and Porter Orphanage (2,000l.); the Governors.

Harwich.—Theatre, King's Quay-street; Mr. C. Thurston, Harwich.

Hebburn.—Offices for Messrs. Hawthorn Leslie & Co., shipbuilders; Messrs. J. & W. Lowry, builders, Corporation-street, Newcastle-on-Tyne.

Howden.—Alterations to workhouse; Mr. H. Green, Clerk, Board of Guardians.

Keighley.—Sunday school; the Pastor, Victoria park, Wesleyan Church.

Launceston.—Generating station adjoining London and South-Western Railway Station, for the Launceston and District Electric Supply Company.

Leeming Bar.—Proposed church; Rev. B. Peirse, Leeming Bar.

Limbury.—School; Messrs. Gotch & Saunders, architects, Market-place, Kettering.

Llanhllith (Mon.).—Fifty houses; Mr. D. J. Loughor, architect, Pontypool.

Locks Bottom (Bromley).—Proposed exten- sions to workhouse (12,000l.); Architect, care of Mr. E. Haselhurst, Clerk, Board of Guardians, Bromley.

London.—Grain silo; Messrs. J. Ballantine & Co., builders, Strand-road, London.

Lowestoft.—Beach school; Messrs. Oliver & Chetwood, architects, Bloomsbury-square, W.C.

Lytham.—Club-house for the Lytham and St. Anne's Golf Club (3,100l.); Mr. G. H. Willoughby, architect, 48, Parr's Bank-build- ings, Manchester; Messrs. Dryland & Preston, builders, 20, Clifford-road, Blackpool.

Malton.—Workhouse laundry; Mr. C. H. Channon, architect, care of the Guardians, Malton.

Mansfield (Notts.).—Additions to workhouse; Messrs. Vallance & Westwick, architects, Mansfield; Messrs. Moore & Son, builders, Mansfield.

Monkton.—New school; Mr. W. Reid, archi- tect, Monkton.

Nanthir.—Fifty houses; Mr. Sansome, builder, Blaengarw.

Newcastle-on-Tyne.—Building Dove House, also business premises, Northumberland-street; Mr. Henry Gibson, architect, Dean street, Newcastle-on-Tyne.

Newcastle (Staffs.).—Business premises, also new premises for Messrs. Coop & Co., Ltd.; Mr. H. Booth, architect, 42, Regent-street, Haslingden; Messrs. Broadhurst & Son, builders, High-lane, Burslem.

Old Whittington.—County school; Mr. J. H. Beckett, builder, Mansfield, Notts.

Oswestry.—Almshouses (1,400l.); Mr. J. C. Vaughan, builder, Oswestry.

Penrith.—Grammar school; Messrs. Harrison & Ash, architects, Newcastle-on-Tyne.

Perry Barr (Birmingham).—School; Mr. Hutchings, County Hall, Stafford.

Port-Glasgow.—Bank (8,000l.), for the Union Bank of Scotland; Messrs. George Arthur & Son, builders, Airdrie.

Redditch.—School (6,425l.); Mr. A. V. Rowe, architect, care of Mr. A. W. Priestley, Secre- tary, Education Committee, Worcestershire County Council, Worcester.

Rhosddu.—New church; the Vicar, St. James', Rhosddu.

Rochdale.—Alterations to wood mill for Messrs. A. Mosley & Sons.

Ropley and Sholing.—Schools; Mr. W. J. Taylor, The Castle, Winchester.

South Crosland.—Extensions and additions to Cocking Steps Mill for Messrs. John Wigley & Sons.

South Shields.—Two school departments, Stanhope-road (8,450l.); Mr. J. L. Miller, builder, Albion-road, North Shields.

Southwick.—Isolation hospital; Surveyor, Southwick Urban District Council.

Stoke-on-Trent.—Electric power station (5,120l.); Mr. Wardle, builder, Longport, Stoke-on-Trent.

Viewforth.—School (8,000l.); Mr. J. A. Carfrae, architect, 3, Queen-street, Edinburgh.

Walsall.—Business premises, Park-street; Messrs. Hickton & Farmer, architects, Bridge- street, Walsall.

Walton (near Peterborough).—Factory for Messrs. Frederick Sage & Co.; Mr. A. W. Ruddle, architect, Peterborough; Mr. J. Cracknell, builder, Peterborough.

Warrington.—The following plans have been passed:—Office, etc., off Longford-street, for the Warrington Steel Foundry Company, Ltd. Garage, Powell-street, for Messrs. J. Patter- son & Sons. Extensions to works, Bawsey-road, for the Warrington Wire Rope Company.

Winchcombe.—Proposed twelve houses, Greet road (3,000l.); Mr. T. Smith, Surveyor, Winchcombe Rural District Council.

Wood End (near Birmingham).—Residence; Mr. B. J. Emery, architect, 109, Colmore-row, Birmingham.

Woodlands.—Church (7,000l.); Messrs. Mullins & Richardson, builders, 5, Shotton- street, Doncaster.

THE LATE MR. JOHN SHAW.

The late Mr. John Shaw, of Wirksworth, Derbyshire, stone merchant, of the firm of Messrs. Bowne & Shaw, who died on July 8, aged 90 years, was one of the pioneers of the limestone quarrying industry in that county. His estate is of the gross value of 55,590l., with net personality sworn at 22,841l.

* See also our list of Competitions, Contracts, etc., on another page

NURSES' HOME AND SHORT-PERIOD LUNATIC WARDS, HACKNEY UNION INFIRMARY.

THESE buildings are about to be erected on vacant land adjoining the Infirmary, and approached by a private road dividing the latter from the Workhouse. The main part of the lunacy wards is one story in height, with a second story containing quarters for male nurses above the centre of the block, the staircase approach forming a division between the accommodation for male and female lunatics. Below this building is a heating chamber working both blocks. The nurses' home has a subway connexion from the infirmary passing beneath the lunacy wards. The centre portion of the ground floor is devoted to sitting-rooms for the nurses and sisters; the remainder of this floor and the whole of the upper stories being devoted to nurses' bedrooms, bathrooms, boxrooms, and linen storage; 101 bedrooms in all are provided. Both buildings will be of fire-resisting construction. Airing yards for male and female lunatics occupy the space east of the lunacy wards, west of which is the male officers' recreation-ground. The space on the west of the nurses' home is devoted to a nurses' recreation-ground. A cycle store will be provided as a detached building against the boundary wall. The tender of Messrs. F. & T. Thorne, of Poplar, amounting to 19,460*l.*, has been provisionally accepted for the work. The architect is Mr. W. A. Finch, of 76, Finsbury-pavement, E.C.

THE ROYAL COMMISSION ON SEWAGE DISPOSAL.

THE Seventh Report of the Royal Commission on Sewage Disposal, just issued, seems to possess, in some respects, features of wider interest than those previously published, and for that reason may appeal to a larger public than is usual with works of this character, however important the subject matter may be to the body politic.

Naturally, anything emanating from such a source as the volume under consideration will be of interest to those more professionally concerned in the science of sewage "treatment" and disposal, embracing, as it does, within that category not only sewage and municipal engineers, chemists, and bacteriologists, but municipal and public health officials generally. This Report will, however, doubtless be of interest to a wider public, and even the scientifically-disposed "man in the street" will find much to attract him in the descriptions of the means used for the unveiling of some of Nature's secrets which this publication contains, and may consequently welcome any matter calling his attention thereto.

The just issued Blue Book—Volume II, Appendices, Part I.—contains the minutes of evidence, and very detailed reports to the Commission in reference to growth of green seaweeds in sewage-polluted estuaries; though, on looking more fully into the matter, it is realised that pollution can similarly take place in the open waters of the sea coasts. The subject possesses at least a threefold aspect, because, not only has it a bearing

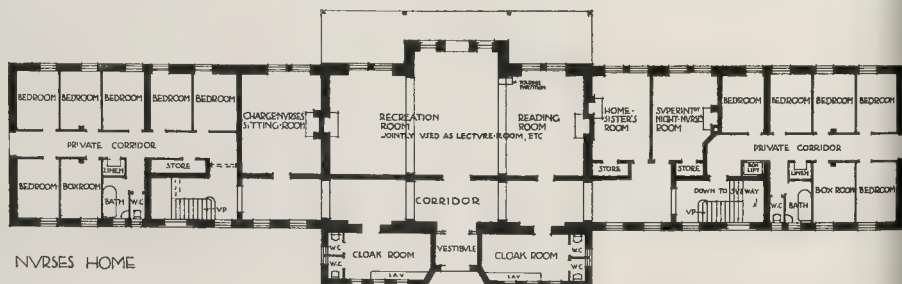

upon the discharge of crude sewage or perfectly "treated" effluent into estuaries and the possibility of detrimentally affecting the shores upon which the various currents may carry it, but there is in such a case consequent interference with the amenity of riparian communities and private owners, and, in addition, the pollution of any fish layings and other infringements of the Rivers Pollution Prevention Act, 1876, which applies to the United Kingdom.

As regards the legislative aspect of the subject, it has to be admitted that, although some five-and-thirty years have passed since the 1876 Act was placed upon the statute book, yet even now scientific knowledge does not enable satisfactory compliance with requirements in every case, and the example before us exemplifies this.

The present publication is of especial interest to local sanitary authorities where areas are situated either upon the sea coast or on estuaries or arms of the sea, because of the effect of the discharge of crude sewage or of effluent upon the water therein; and, further, the consequences of their reaching neighbouring coasts.

Briefly, the Report, minutes of evidence, and the numerous tables which it also contains, concerns the action both of "treated" and "treated" sewage upon water, in estuaries, and on the sea coast, the evidence and experiments, whilst dealing more especially with the waters of Bel Lough, also included experiments in the vicinity of the Giant's Causeway and on Devonshire coast.

This work originated consequent on a serious effluvia nuisance which had occurred

NURSES' HOME

LUNACY WARDS

Hackney Union Infirmary: Nurses' Home and Lunacy Wards.

Mr. W. A. Finch, Architect.

years in Belfast Lough, and which led to the Belfast Corporation Act, 1899, containing provisions under which the Corporation provided works, within three years, for the proper purification of the sewage of the city. Circumstances, which the following perhaps explain, have militated against these requirements.

Up to then the only "treatment" which Belfast sewage had received was by screening and sedimentation, a process still carried out in decision as to the most satisfactory method to employ to prevent a recurrence of nuisance.

Nuisance in question, it had been established by investigation and experiment, could proceed entirely to rotting green seaweeds, chief of which being the *Ulva latissima*. In this class of seaweed can grow in sea water, there seems to be every indication that the growth is remarkably tardy when compared with that in sewage-polluted sea.

The spring and summer months are conducive to its growth (experiments showed increase of 25 per cent.), and these seasons coincide with the periods of greatest nuisance from pollution of all kinds. The *Ulva* taken from mudbanks in Belfast, the chief nursery there of this species (the algae, and where the sea water flower which is polluted to the extent of 1 per cent with Belfast sewage (as measured by the alkaline nitrogen), was found to contain 10 per cent of sulphur, as compared with 1 per cent in sewage sludge.

It may be mentioned that Professors Lettis and Lettis, and others, are of opinion that the growth of sewage is not likely to be needed in most cases of seaside pollution at a measurable distance from the outfall. The opinion of Professor Adey, the author of the nuisance in Belfast Lough is that the putrefaction in the presence of sea of marine algae, the growth of which is stimulated and promoted by sewage.

Ulva latissima grows luxuriantly in sewage-polluted water, but, curiously, it is but little where there are great quantities of sewage as at an outfall, because it could not exist there; it would, in fact, be red.

It seems no doubt but that not only water at places in the British Isles, but on the Continent, the presence of a kind of green seaweed, the *Ulva*, is evidence of sewage pollution. At the same time it seems clearly established that sewage is also conducive to the growth of *Ulva*.

It appears that there is a decidedly interesting connection with the *Ulva* in that it requires something to which to attach itself, and besides being found on rocks and solid bodies they show a predilection for the shells of mussels (either dead or alive). Mussels attach themselves to "byssus" threads, which they throw out. Mussels are often found in polluted water; indeed, they seem most prolific there, and appear to deliberately attach themselves to the *Ulva*.

Professor Lettis suggests some sort of symptom of the *Ulva* and the mussel that eats the small creatures which are killed by the mussels.

Situations where sewage effluents have been discharged into sea water there seems indication that the removal or destruction of mussel beds will bring about the cessation of the growth of the *Ulva*, for the production of which they rear nurseries, and thus prevent the rotting of the *Ulva* and consequent nuisance.

Persons occupying lands in the vicinity of *Ulva* growth in Belfast Lough take in amount away in carts to put on the manure.

A difficult point to determine, however, means to employ to get rid of the nuisance.

Experiments at Belfast with sulphate of copper on an area of 37 acres densely covered with mussels, and where *Ulva* had increased their annual growth, had no last effect. Where mussels, however, were present in trenches, the particular area has, in the words of Mr. H. A. Cutler, M.Inst.C.E., Belfast City Surveyor, "practically ceased to be a nursery for growing weed, and that the mud has disappeared."

With regard to the effect of clearing off mussels in greatly reducing the growth of *Ulva latissima*, Southend is an interesting and useful case in point, for, as a result of such clearance, the *Ulva* was washed away by the tides.

The subject is one to which much knowledge has been added by the investigations of the Royal Commission, but its labours should by no means end with the Report just issued, for it is a matter of much importance to all sanitary authorities whose areas are situated on estuaries and the sea coasts, as well as to riparian owners and proprietors of edible shellfish layings so situated.

HOUSING IN MIDDLESEX.

DR. C. W. F. YORKE, the Medical Officer of Health for Middlesex, gives some interesting information in his annual report, which has just been issued, with regard to the housing question in the county. He summarizes reports which have been received from the district medical officers of health in relation to the Housing and Town Planning Act, and the question generally, as follows:—

Acton.—Dr. Thomas states that it is proposed early in each year "to draw up a list of houses which have shown an excessive mortality and a high infantile mortality in the previous year, and to these will be added others which, for some special reason, e.g., unusual incidence of infectious disease, appear to need inspection." In commenting upon some of the streets inspected he states:—"It will be observed that some of the streets have been comparatively recently erected, and yet the percentage of sanitary defects in these houses is almost as high as in the older property."

Brentford.—Dr. Dott states that under the Housing and Town Planning Act it has been found possible to deal more expeditiously with insanitary property.

Chiswick.—The system previously in force here has needed but little alteration to comply with the requirements of the regulations under the Act. Attention is drawn by the Medical Officer of Health to houses in Essex-place, which, at the date of his report, were uninhabitable.

Edmonton.—Closing orders under sect. 17 of the Housing Act were made as regards eighteen houses. Six houses were otherwise closed and fifteen houses were demolished by the owners.

Enfield. Action has been taken for instituting systematic house inspection. During the year four houses were closed.

Finchley.—The system of house to house inspection previously carried out practically meet the requirements of the regulations under the Act.

Furn Barnet.—Dr. Sprent writes that the housing accommodation in the district is adequate.

Hampton.—The housing accommodation is reported to be adequate. Sixty-five houses erected by the Council a few years ago under Part III. of the Housing Act "have been almost fully occupied during the whole of the year."

Hampton Wick.—Arrangements have been made to carry out the regulations in an efficient manner. Several houses were voluntarily closed by owners after notice had been served on them to carry out needful repairs.

Hayes.—In this district the housing question assumed an urgent condition, owing to an influx of workers, and the fact that many houses are in an insanitary state. The district medical officer writes that the housing accommodation is very inadequate. Owing to several large factories having been built at Botwell, cottage property of a rental of from 5s. to 7s. 6d. per week were in great demand.

Numbers of workers at the factories reside outside the district. In the houses in that portion of the district near the factories there was considerable overcrowding. A number of cottages were in an insanitary condition, but before anything could be done in the way of closing them other accommodation would have to be provided.

Hendon (Urban).—In commenting on the class of houses which are being built in the district, Dr. Andrew says they are not specially suited to persons of the working class, and that the question of erecting accommodation for same has been for some time under the consideration of the Council.

Heston and Isleworth.—Dr. Buchan, referring to the recently-issued regulations of the Local Government Board as to inspection of houses, urges that additional powers are needed in connexion with (1) the absence of proper storage for and the preparation of food; (2) the paving and drainage of courtyards common to more than one house; and (3) the cleansing

of cellars, etc. He suggests draft clauses for insertion in a local Bill in 1912.

Uxbridge Northwood.—In May the Council received plans for the development of certain areas in the district; they then considered the advisability of a town planning scheme. The Housing and Town Planning Committee reported in August. The Council then gave the Committee authority to prepare all necessary plans, and call Conferences, and do such other acts as might be necessary to make application to the Local Government Board for authority to prepare a scheme. On November 30 the first Conference of landowners was convened. In December plans and evidence were ready to be submitted to the Board, and at the close of the year the Council were only waiting for an inquiry to be held by the Board as to the advisability of preparing a scheme.

Southall-Norwood.—There is ample accommodation in the district for the working classes. **Southgate.** Thirty-four workmen's cottages in Tottenham-road have been erected by the Council.

Staines (Urban).—The housing accommodation is adequate for the needs of the district.

Sunbury.—There is no lack of accommodation for the working classes, houses being unoccupied.

Twickenham.—Closing orders were made in regard to twenty-three houses. Ten of these had been demolished, and the remainder were rendered fit for habitation.

Uxbridge (Urban).—Dr. Lock says that the death rate in the parish compares unfavourably with an adjoining district, and he proposes to make recommendations to his authority for the improvement of the housing conditions. There is need of cottages at a rental of under 6s. per week.

Wembley.—One house was closed, and in three other instances the owner closed houses on learning that the local authority proposed to take action.

Willenden.—Thirty-five notices were served under sect. 15, and six under sect. 16 of the Housing Act, 1909. Four closing orders under sect. 17 were issued.

Wood Green.—Nine houses were repaired and made fit for habitation, and sixteen houses were demolished by the owners without the local authority having recourse to the powers under the Housing Act.

LONDON COUNCILS.

Shoreditch.—The Lighting Committee have decided to convert all the street lamps north of Old-street (1,055 in all) from gas to electricity. The capital cost of laying about fourteen miles of cables in 160 streets of sufficient size to serve not only for the street lamps, but to meet any reasonable demand likely to arise, is put approximately at £3,385, while the cost of converting the lamps for electric lighting is estimated at 65s. The work is to be done gradually.

Wimbledon.—The following plans have been passed:—Britannia Incandescent Mantle Company, Ltd., additions, rear of mantle works, Ravensbury-road; Messrs. Holloway Brothers, additions to hospital, Thurston-road; Mr. W. Miles, additions, "Kelvinville," Malcom-road; Messrs. Ogden, Sons, & Olley, motor garage, Grosvenor-hill; Mr. Melville S. Ward, additions, "Rusthall," Parkside.

LAW REPORT.

Breach of Building By-Laws: Doncaster Architect Fined.

AN interesting case was heard at the Doncaster Borough Police Court on Monday, when Mr. Thomas Henry Johnson, of Priory-place, one of the best-known architects and surveyors in the town, was summoned for two offences against the Doncaster Corporation Building By-Laws.

The Town Clerk, who prosecuted on behalf of the Corporation, stated the offences consisted of building contrary to plans which had been approved by the Sanitary Committee, and of making substantial additions to a building without submitting any plans at all.

In March last Mr. Johnson submitted plans for a shop and temperance hotel in Frenchgate. The plans showed walls 9 in. thick, whereas they should have been 15½ in. thick.

Amended plans were passed on March 28, but on August 11 the Borough Surveyor discovered that the third story of the building had only a 9-in. external wall instead of the 14-in. shown on the plan. Over and above this a very substantial addition had been made to the premises, six bedrooms, bathroom, and water-closet having been added without any plans being submitted. The Surveyor wrote, asking the defendant to discontinue operations, but the work had continued up to the present time. He asked the Bench to inflict a substantial

penalty, and also a continuing penalty from August 11.

Mr. Williamson, of Retford, who defended, pointed out that it was unlikely in a building which was to cost 7,000l. a man would wilfully break the by-laws in order to save 15l. The mistake was due to a series of unfortunate circumstances, and in the negotiations defendant had always said he was willing to put right anything that was wrong. Owing to a change of clerks in defendant's office the wrong plans were sent to the contractor, and defendant was actually paying for a 14-in. wall whilst a 9-in. wall had been erected. He was still prepared to put the error right.

The Bench imposed a fine of 2l. 10s. in each case.

FOREIGN AND COLONIAL.

Demand for Concrete Mixers in Spain.

According to an American Consular Report, large quantities of concrete are being used in Seville, where the operation of mixing is done by hand; but the opinion is expressed that machinery would find ready sale if introduced by enterprising firms. Another reason making this outlet a promising one for makers of concrete mixers is, that in the preparatory work and building now going on, and the improvements in the city that will be made for the Spanish-American Exhibition to be held in Seville during the year 1914, concrete will find very extensive use.

Collapse at Viterbo.

A correspondent of the *Morning Leader* reports that on the 24th ult., at Viterbo, near Rome, seven houses suddenly collapsed "as if they were a pack of cards." Several persons were seriously injured. No earth tremor was felt, nor was there any other apparent cause of the disaster. Civil engineers sent by the Government say that many other houses threaten to collapse and must be abandoned.

Progress of Chicago.

According to a report from the British Consul in Chicago, the building figures of that city for 1910 show a remarkable increase over those of 1909, and are the largest hitherto recorded. Permits were issued during 1910 for construction of 11,408 buildings, involving a total outlay of 19,353,125l., as compared with 11,241 buildings, costing 18,644,900l. in 1909. Improvements effected by the city of Chicago included an expenditure of 429,400l. on the new City Hall during 1910; also 100,000l. on paving repairs.

New Fruit Market, Milan.

The spacious market opened this year in Milan replaces several fruit and vegetable markets previously held in the centre of the city. The new buildings cover a site about 1,500 ft. long by 650 ft. wide, in communication with the goods stations by means of a branch line. The warehouses are disposed in the form of two concentric circles around the central buildings. The interior warehouses are reserved for wholesale business, and those in the outer circle are devoted to retail trade, conveniently arranged shops being provided for occupation by dealers. The inner buildings are spacious steel frame sheds, 65 ft. wide by about 26 ft. high, and the outer buildings are of masonry construction. The interior of the new market includes a hotel and a restaurant, as well as stables for the use of cultivators who send in their produce by road, and are obliged to remain some time in the city. The market was established by the municipality, and forms one of the most useful among the various improvements effected within recent years in the commercial capital of Italy.

TRADE CATALOGUES.

We have received from the "Peerless Heater" Company, of 70 and 71, Bishopsgate-street Within, a booklet describing the "Peerless" gas-heated kitchen boiler. It is claimed that the "Peerless" will heat more water and keep it hot, on a smaller consumption of gas, than any other heater. The parts are simple, and there is little to get out of order. For country house use, where there is no gas, a gasoline burner may be attached, and the results are precisely the same as where gas is used. The extremely moderate price at which it is supplied, and the sound principles and simplicity of its design, should ensure for it a steady and increasing popularity.

Messrs. Mander Brothers, of Wolverhampton, and Noel-street, Oxford-street, London, W., forward us a booklet dealing with their well known decorative specialities. Specimens are given of this firm's well-known "Suffield" greens, which will, it is claimed, stand all weathers without loss of colour. It is made in 14

ten shades, and, when mixed with white, is susceptible of many rich and beautiful tints. The "Olsina" water paints are particularly deserving of the attention of our readers. Besides being specially adapted for schools, hospitals, and public and buildings generally, they can also be tried on ironwork, such as radiators, hot-water piping, steamship funnels, etc. "Olsina" is made in one hundred different shades, and may be varnished to form a suitable wall decoration for bathrooms. Among the firm's other specialties we desire to call attention to the "Matsine" transparent colours, which may be used as a stain on new woodwork, as a "scumble" on painted work (by this method, when applied on different ground colours, the characteristics of many rare woods may be reproduced), or as a glaze on the top of old grained work. Messrs. Mander's varnishes are well enough known to need no encomium from us.

PATENTS.

APPLICATIONS PUBLISHED.*

11,246 of 1910.—Domingo Desplats: Device for retaining doors, windows, and the like in an open position.

18,715 of 1910.—James McLellan: Apparatus for simultaneously heating and coating the surfaces of stone, brick, earthenware, concrete, metal, and hardware articles of all kinds with metals and vitreous materials.

18,716 of 1910.—James McLellan: Process for coating the surfaces of stone, brick, earthenware, concrete, metal, and hardware articles of all kinds with metals, vitreous materials, and the like.

19,003 of 1910.—William John Dunn: Door locks.

20,782 of 1910.—Joseph Freeman Goddard: Concrete and like compounds.

21,322 of 1910.—William Duggan: Apparatus for closing doors and gates.

21,600 of 1910.—Edgar Newton: Means for the connexion and fixing of taps for baths, basins, sinks, and the like.

22,866 of 1910.—Gottfried Obrist, Wilhelm Obrist, and Alphons Obrist: Uniting of glass panes.

23,257 of 1910.—William Henry Richardson: Air inlet valves for drains.

24,643 of 1910.—Otto Buchholz and Alfred Buchholz: Guard for the top openings of the waste pipes of roofs.

86 of 1911.—William Julius Baltzer: Forming concrete bodies in moulds.

984 of 1911.—Professor Dr. Wilhelm Schneidewind and Dr. Dietrich Meyer: Apparatus for opening and closing doors.

6,665 of 1911.—Heinrich Christophery: Door or window handles.

7,075 of 1911.—Frank McMurray Sawyer: Construction of walls, columns, and the like.

7,575 of 1911.—Frank Hine Willis: Fire resisting floors.

8,025 of 1911.—Ludwig Schiff: Door-securing devices.

9,634 of 1911.—Frederick James Marchmont and Edward John Farrell: Wall ties.

11,532 of 1911.—Erwin Marshall Hilton, Albert Veil, and Alfred Henry Lovignour: Means for securing sheets of glass to window frames and the like.

SELECTED PATENTS.

7,567 of 1910.—Alfred Lee Moorshead: Rail way station roofs.

This relates to railway stations wherein the roof is supported on columns placed between adjacent tracks, so as to leave the platforms unobstructed, and a minimum space is provided above the engine funnels so that the smoke may quickly escape. Subways for goods or local trains may be built under the platform. A sectional elevation of one form of roof is shown, also an enlarged detail. The columns

7,667 of 1910.

12 are arranged between the pairs of tracks 10, and support the roof principals 15.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

Baffle-plates deflect the smoke through tubes 26. Skylights 21 extend on each side of the ridge of each span, with or without impervious roofing. The valleys are covered by portions 24, which are carried by brackets on the longitudinal girders. Rainwater is drained off by gutters leading to fall adjacent to alternate columns. The framework consists of steel plates and bars riveted together and covered with concrete.

7,802 of 1910.—Ludwig Pollaert: Scaffold.

This relates to a scaffold-securing device wherein the scaffold poles are secured together by chains c, each having one link d permanently connected to a slotted clamping e, the chain being passed round the vertical pole, hooked over a lug on the upper end of the bar, and then passed round the horizontal

7,802 of 1910.

pole and hooked over a lug on the lower end of the bar, the weight of the horizontal actuating the lower end of the bar to the chain around the poles. Adjustment of poles of different diameters is effected by J-shaped slot l, and the pairs of lugs m and g, f.

8,442 of 1910.

8,442 of 1910.—Kenneth Faro Deskins: Window holders.

This relates to window frames wherein the sashes are held in any position by

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvii.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

SEPTEMBER 9.—**Eforest-fach.**—Parish hall, to cost 1,200. Premiums 25, 10, and 5. Particulars from H. Plant, 14, Fisher-street, Swansea.

SEPTEMBER 9.—**Fontenay.**—SWIMMING-BATH.—Open to architects of the West Riding Yorkshire. Particulars from the Borough Engineer.

SEPTEMBER 12-25.—**Athens.**—COURT OF JUSTICE. An international competition is instituted by Ministry of the Interior, for the erection of a building, to cost 160,000. The Official Rules may be seen at the Library of the B.A.

SEPTEMBER 15.—**Lowestoft.**—SCHOOL.—The Lowestoft Education Committee invite designs and specifications for a new school, to cost 10,000. Three premiums are offered: 20, 10, and 5. See advertisement in issue of June 16 for further particulars.

SEPTEMBER 15.—**Manchester.**—LIBRARY AND GALLERIES.—Limited to the ten selected competitors in the first competition. See issue of June 23, p. 780.

SEPTEMBER 14.—**Eastington R.D.C.**—100 model sets for Merton Colliery, Durham. 24 per cent. on net cost to successful architect.

SEPTEMBER 7.—**Barnesley.**—EXTENSION OF THE BARNESLEY T.C. invite drawings for proposed extension of Public Baths. Three premiums are offered—500, 300, 200. See advertisement in issue of August 11 for further particulars.

SEPTEMBER 7.—**Evesham U.D.C.**—Designs for building out site and erecting thereon three small houses. Particulars from the Clerk to the Council.

SEPTEMBER 12.—**Coseley.**—Plans are invited for a school to accommodate about 200 children. Particulars from the Education Officer, Coseley, near Aston.

SEPTEMBER 14.—**Bristol.**—ALTERATIONS IN THE MID HOTEL.—Particulars from Mr. E. Atkins, 44, Corn-street, Bristol.

SEPTEMBER 25.—**Salford.**—Extension of office accommodation on Workhouse site at Eccles New. Premiums 200, and 100. Particulars from Board of Guardians, Salford. Limited to architects practising in Salford district only.

SEPTEMBER 30.—**Holland.**—STAINED GLASS WINDOW.—Designs are invited for a stained glass window to be erected in the University at Oxford. See advertisement in issue of June 9 for further particulars.

SEPTEMBER 31.—**Marblebone.**—NEW MUNICIPAL BUILDINGS.—Premiums of 1000, 750, 500. The designs of Mr. Henry T. Hargrave, F.R.I.B.A. Set off September 1 of issue of July 14 for further particulars.

SEPTEMBER 1.—**City of St. Petersburg.**—CONTEST TO ALEXANDER III.—Particulars in our issue of August 13, 1910.

SEPTEMBER 30.—**Cardiff.**—TECHNICAL INSTITUTE. The Cardiff Education Committee invite designs and estimates for a technical institute. See advertisement in issue of August 18 for further particulars. Successful architect to carry out work. Premiums of 1250, 750, and 500, to Mr. E. T. Hall, assessor.

SEPTEMBER 30.—**Hastings.**—EAST SUSSEX HOSPITAL.—The Joint Committee of the East Sussex Hospital and King Edward VII. Memorial Funds invite designs for new hospital. advertisement in issue of August 25 sets out the particulars. Premiums of 1250, 750, and 500. Mr. E. T. Hall, assessor.

SEPTEMBER 29.—**Glasgow.**—DESIGN FOR A DOCK.—Designs are invited (Alexander Thomson, 37, Glasgow, City). The Government of the monthwealth of Australia invite competitive designs for the laying out of this Federal capital. See advertisement in issue of September 1 for further particulars.

SEPTEMBER 1, 1912.—**Dusseldorf.**—A plan for the reconstruction of the City of Dusseldorf. Premiums 1000, 500, and 250. Copy to be seen at the application to Chief Burgomaster, Dusseldorf.

SEPTEMBER 1.—**Nottingham.**—BAPTIST CHURCH REPAIRS.—Limited to Nottingham architects. Particulars from Messrs. Borske & Jackson, 10, King-street, Nottingham.

SEPTEMBER 1.—**Rochdale Infirmary.**—EXTENSIONS. See advertisement in issue of August 18 for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

SEPTEMBER 9.—**Aberdew.**—BUILDINGS.—Erection of new farm buildings, etc., at the Court Farm. Plans and specification from Mr. Thomas Roderick, architect, Clifton-street, Aberdeen.

SEPTEMBER 9.—**New Tredegar.**—ALTERATIONS, ETC.—For alterations, etc., to the Queen's Hotel, Tredegar. Specification from Mr. George Kenhole, M.S.A., Bargoed.

SEPTEMBER 9.—**Ramsgate.**—EXTENSION.—For the extension of the manual room at the school. Specifications by the Committee's Architect, Mr. Wilfred H. Robinson, of Canton House, Westminster, seen at the offices of the Local Secretary, Mr. A. R. R. Franks, Public Library, Ramsgate.

SEPTEMBER 11.—**Abercromby.**—HOUSE. Alteration of a house. Plans from Mr. J. T. Williams, architect, Napier-street, Cardigan.

SEPTEMBER 11.—**Belfast.**—WAREHOUSE. Erection of new warehouse premises in Albert street and Fox-row. Plans and specifications with Messrs. Blackwood & Jury, M.S.R.I.A.I., architects, 41, Donegal-place, Belfast, and quantities from Mr. S. C. Hunter, Scottish Provident-buildings, Belfast, on deposit of 25, 25.

SEPTEMBER 11.—**Port Dinorwic.**—HOUSE. Erection of a dwelling-house. Plans with Mr. Llewellyn Lloyd Jones, architect and surveyor, Tower-buildings, Carnarvon.

SEPTEMBER 12.—**Exeter.**—ADDITIONS, ETC.—For alterations and additions at the Workhouse laundry. Plans and specifications seen, and quantities from the architect, Mr. R. M. Challice, 14, Bedford-circus, Exeter.

SEPTEMBER 12.—**Gwynn-ae-Gurwen.**—REPAIRS, ETC.—Repairs and alterations of Carmel Congregational Church. Specifications and plans with Mr. D. Morgan, architect, Brynhyfryd, Gwynn-ae-Gurwen.

SEPTEMBER 12.—**Newton Abbot.**—WOODSHED, ETC.—Erection of a woodshed and also construction of a cold-chamber at the Workhouse. Plans and specifications with the architect, Mr. Segar, Union-street, Newton Abbot.

SEPTEMBER 12.—**South Barton.**—WORKS.—For carrying out certain works at the dwelling house and outbuildings. Plans and specifications from Mr. James Crockett, F.R.I.B.A. architect and surveyor, Stuckey's Bank chambers, Exeter.

SEPTEMBER 13.—**Wigan.**—SHED.—Erection of a cart-shed at Green Side Farm, Billinge-Higher End. Plans and specification with Mr. H. Gordon Ackerley, Clerk, 9, Victoria-buildings, King-street, Wigan.

SEPTEMBER 14.—**Chilpenham.**—ADDITIONS, ETC. Alterations and additions at Castle Coombe Council School. Plans and specifications, on deposit of 10, 10, from Mr. J. G. Powell, County Surveyor, Trowbridge.

SEPTEMBER 14.—**Dowla.**—ALTERATIONS.—For alterations to Pantecollos House. Plans and specifications seen, and quantities from the architect, Mr. Thomas Roderick, Clifton-street, Aberdeen.

SEPTEMBER 15.—**Barrow-in-Furness.**—POST OFFICE. Extension of post-office. Drawings, specification, and contract with the Postmaster, Barrow-in-Furness. Quantities on deposit of 10, 10, from the Secretary, Post Office of Works, etc., Storey's-gate, London, S.W.

PATENTS.—Continued from page 286.

engagement of teeth 7 on bowed springs 4, 4a, mounted on the edges of the sash-stiles with corrugated strips 3 secured on the frame. The springs 4, 4a, are secured at one end to the sash-stiles by screws, while the other ends are secured by screws passing through slots 6 in the springs. On the bottom sash is mounted a spring catch 11 of ordinary construction, sliding in a casing formed by bending over the upper end of the spring 4a, and engaging a recess 8 in the upper sash.

8,488 of 1910.—William John Stewart: Piles. This relates to hollow, wooden, and other piles, which may, after driving, be filled with concrete; the piles are constructed of stout longitudinal ribs 1, alternating with lighter ribs 2, and connected together by means of stays. A light sheathing 4 of wood is connected to the ribs; and on the outside of the sheathing are secured longitudinal pieces 5 of hoop iron, to the exterior of which are fastened hoops 6. The shoe, which consists of a balk of timber 7, having an iron or steel point 8, is attached to the ribs 1, 2, and the sheathing 4, and vertical pieces 5 may also be brought down over the shoe. The pile is driven by means of a core provided with fixed or adjustable horizontal or longitudinal ribs, which

8,488 of 1910.

contact with the lighter ribs of the pile. A solid core 10 projects through the bottom of the pile, and is provided with shoulders 12, with projections 14, 15, for assisting in pulling the pile downwards.

(See "Note" on page 283.)

A QUAINI TEXT-BOOK OF 1734.

"January 11, 1734.—We have perused these Two Volumes of The Builders Dictionary and do think they contain a great deal of useful Knowledge in the Building Business.

NICHOLAS HAWKMOOR. JOHN JAMES. JAMES GIBBS."

THE chief interest of this sumptuously-bound volume lies in the recommendation. Doubtless these names had weight, as letter is given a whole page, that in opening the book we find courteous hint that someone has been able to see that ordinary readers have been safeguarded in their quest for

"useful Knowledge in the Building Business."

Good bold type is accorded to the Preface to induce us not to miss it. And a wonderfully true statement is included in its propositions, viz., that "Distress was the Parent of Architecture." Many think that no alteration has occurred in this country, with certain notable excep-

tions, and that Distress possesses that which Emerson attributes to the English race, "great spawning power," so far as architecture is concerned. We are at liberty to differ or agree with both opinions, each to his liking.

The proposition of our text-book is that distress produced the "Indians' hut and the Icelanders' cave," and as the

authors beg us not to censure them even if they are not "Worthy of Applause," we may, perhaps with emphasis, say there is something in their proposition, however the other may stand.

"To conclude," says the Preface, "we have nothing more to add but our grateful Acknowledgements to those Gentlemen and Artists who have favoured us," etc.

To say that this discrimination is easily understood renders one liable to misconstruction, at a time, too, when we are all gentlemen and ladies. We know what the authors intended to convey, and doubtless the gentlemen and artists found their reward in a way which made up for any secret annoyance due to the distinction being drawn in such a case. We have to accept the premises that private gentlemen did not assist and that competent professional men did, and this begins a series of arguments sufficient to occupy a debating club's time during a whole evening. There is a deal of worry in thinking the matter out alone, and it is not advised.

"Building is used to signify both the Constructing and Raising of an Edifice; in which sense it comprehends as well the Expenses as the Invention and Execution of the Design. In Building there are three things to be considered, viz., First, Commodity or Convenience, Secondly, Firmness, Thirdly, Delight."

If there be a "peage in words," as Ruskin bids us learn, here is an example. One which shows us the depth and quality of the tongue which is one of our shured privileges.

The order may be altered to desire, our text-book says—

- (1) Commodity or Convenience.
- (2) Firmness.
- (3) Delight.

Altogether it seems to need nothing more than the statement as the authors left it—a standard to work up to.

What are the "Ichonography, Orthography, and Stenography of the staircase"? It is laid down that "no Person who intends to build a Structure" should proceed "without the Advice of a Surveyor or Master-Workman who understands the Theory of Building and is capable of drawing a Draught." And "In a Draught there ought to be the Ichonography of each Floor, and the Orthography of each Face"; then, "if the Artizan be well versed in Prospective more than one face may be represented Stenographically."

In any case, it is plain that Ichonography is an essential in a staircase or elsewhere; "likewise the Ichonography of all chimneys, both as to length and breadth of Hearths, Jambs, Bed-Places, Width of Doors, and Windows, in each Contignation or Floor."

So that we must observe the Ichonography of each Contignation.

There is a sympathetic, full-of-fellow-feeling sort of paragraph telling us "By no Means build too near a Great Neighbour, which were to be as unfortunately seated on the Earth as Mercury is in the Heavens, for the most part ever in Combustion or Obscurity under brighter Beams than his own."

This is described, as the authors say, as "A Political Precept," because they don't know what else to call it; and in italics too.

The sentiment has relationship to that of some of our present town-planning schemes, in so far as the Greater Neighbours are called upon for a better aim than that of extinguishing smaller ones if they live in the town which is planned.

We are shown an interesting account in "Mr. William Blakewey's Bill of Materials had of, and work done, by Thomas Halling, Bricklayer, June 5th, 1732:—

	£	s.	d.
For 8000 of Bricks @ 12/- per M..	4	16	0
For 4000 of Tiles @ 20/- per M. .	4	00	0
For 1500 of Lime @ 12/- per C. .	9	00	0
For 14 Load of Sand @ 2/6 per L	1	15	0
For 500 Nine inch Paving Tiles @ 11/- per C. .	2	15	0
For 30 Ridge Tiles @ 1 1/2/- per piece	0	04	4 1/2
For 3 weeks and 2 days work for myself at 3/- per diem	3	00	0
For 25 days work and a half for my man 2/6 per diem	3	03	9
For a labourer 25 days and a half at 1/8 per diem.	1	18	0
Their Sum Total is	30	12	5 1/2

If the error in the total is thought to be the builder's, as it is in his favour, what are we to say of the extension of the labourer's item?

Our authors say that "the bricklayers bill may be made after this manner," so that we must not be hypercritical. Doubtless an adjustment took place. Then we read, "But if Bricklayers do not work by the Day, then they either undertake the Work by the Great, viz., to do all, and to find all the Materials; or else they are to do it by Measure, and to do all the Work and to find all the Materials at such a price by the Rod for Walling; by the Square for Tiling; and by the Yard for Paving, etc."

In addition, we get a description of piecework, "according as he" (the bricklayer) "has made his agreement."

So that in 1734 building methods included estimated work, daywork, measured work, and piecework, as in our day.

In "Foundations" it is stated, "That we may found our Habitation firmly requires the exactest care." Surely this is well put. Turn it into the phraseology of our modern specification as a beginning for excavator and concretor, as—"All parts of the structure must be firmly founded with the most exact care," and it loses its quality without gaining any great merit as an instruction, though it retains its flavour of warning.

We get a reason for this exactest care. "For, says Sir Henry Wootton, if the Foundation dance 'twill marr all the mirth in the House."

In the instructions for foundations we meet our present rule for the bottom course of footings.

"Thirdly, that the breadth of the Substruction be at least double the Breadth of the Wall that is to be raised upon it.

But even in this case Art ought to give way to Discretion and the substruction may be made either broader or narrower, according as the Goodness of the Ground, and the Ponderosity of the Edifice requires."

In "Floorings" the "Receipts" are wide in range.

"Take of clayey loam and new soft horse dung one third, with a small quantity of coal Ashes, if they can be had, and temper these—and lay the Floor with the *Stuff* three or four inches thick."

The proportions are mystifying; supposing "coal Ashes" can't "be had."

"Sir Hugh Plat gives us a receipt making an artificial Composition which with to make smooth *glittering* and *lustrous* Floors."

Ox Blood and fine Clay temper together makes the finest Floor in the World."

We may question the wisdom of inserting the following, unless as a sort of backhanded caution, seeing that authors write for those occupied in so way in building. It is frank, yet may be excused for winning.

"Dr. Fuller advises rather to believe any Man rather than an Artificer in his own Art as to the Charges of a Building, especially if either himself or any Friend of his is to be concerned in the *Build* that is designed to be erected! Not that builders can tell nearly the Charge when they know the Design, but it is very rare that they will give a just Estimate of it according to their judgment; because they think that if they should acquaint a Gentleman with the full Expense, first, it would discourage him from prosecuting it; and for that Reason, they soo him up, till it cost him something considerable; after which he must go through with it, or lose what hath been expended."

Then, our authors continue. "The Spirit of Building first possessed Poor after the Flood; which then caused Confusion of Languages, and, since, Confusion of many a Man's Estate. And hence, when some Persons would with a Curse upon one with whom they are anary, they wish them to be possessed with the *Spirit of Building*, or as other term it, *The Italian Plague*."

The adjective could not be "Italian" nowadays if the plague exist still, which we at any rate are not disposed to admit.

Some of us may be inclined to agree with the criticism implied regarding the contemporary examples our authors have in mind. Was it that where seventy were avoided a sort of exotic elegance was attained? That with all the dignity of the examples they were not altogether of the atmosphere if they were in it? However that may be, certainly we may agree that there is a gracious native quality added to our fair English landscapes by some of our modern masters. Their achievements fit the picture of a truly an our woods and our cornfield and meadows, and actually help to make "the smiling land" of England—unmistakably of England.

PRESIDENT OF THE INSTITUTE OF MUNICIPAL ENGINEERS.

Mr. Ernest A. Stickland, A.M.Inst.C.E., Borough Surveyor, of Windsor, has been nominated by the Council of the Institution of Municipal Engineers as President for the year 1911-12. Mr. Stickland was elected in 1890 to Mr. A. M. Fowler, the City Engineer and Surveyor of Newcastle-on-Tyne. On the completion of his articles he obtained a position under the Borough Surveyor of Stockport. In 1895 he was appointed Resident Engineer for the contractor upon a large sewerage extension contract in Blackburn. On the completion of the works Mr. Stickland was appointed an assistant in the City Surveyor's office, York. Leaving there in 1897 he was appointed an assistant to the Borough Surveyor of Reading, where he remained for nearly two years. In the latter part of 1898 Mr. Stickland was appointed Borough Surveyor of Newbury, and in 1897 Borough Surveyor of Windsor.

THE LESSON OF TATTERSHALL CASTLE.

CONSIDERABLE indignation has been provoked amongst the inhabitants of the little Lincolnshire town of Tattershall by the extraordinary and incredible mutilation that the XVth-century castle, in which they take so much pride, is suffering at the hands of its most recent purchasers. The secrecy in which the whole transaction has been veiled indicates that its perpetrators, whosever they may be, realise its discreditability; but the visible progress of the work is a sufficient exposure of its barbarism and folly. The first of the wonderful stone chimney pieces to be torn out from the walls has proved by shattered fragments (as everyone familiar with them anticipated) that their beauty and preservation depended on the support of the brickwork in which they were structurally incorporated. The whole series forms so complete an archaic illustration of nearly four centuries of family and manorial history at their re-erection elsewhere will be incongruous absurdity, the very falsehood of which will rob their art of all that duty which consists in fitness. All the antiquarian societies, national and local, are keenly striving to arrest or pair such gross vandalism, but their task is a difficult one.

This is but one more example of the urgent need of Government control over national monuments. However well formed and energetic our voluntary societies may be, it is impossible for them to take the place of, and act as efficiently as, a properly constituted authority for the purpose of protecting works of artistic or archaeological value, and the other features of interest such as typical scenes of natural beauty and the haunts of wild life.

All these matters would fall within the province of a Minister of Fine Arts when he gets him appointed. Our readers are doubtless aware that steps have been taken towards scheduling buildings of special value up to the end of the XVIIIth century, and that considerable progress has already been made in the preparation of this list. But, important as is the work the Royal Commission so engaged, it by no means covers the ground necessary to include all that it is desirable to reserve. For one thing, it is limited to structures from the hand of man and does not extend to objects for the beauties of which we are indebted to the workings of Nature; besides, why should the period be arbitrarily limited by the year 1700; surely there is much that we should be sorry to lose belonging to more recent periods?

As the beginning of a long and arduous undertaking, all welcomed the appointment of this Commission, but the question arises, whether we can afford to wait for the completion of its labours before making more definite steps? We think not, and the possible fate of Tattershall Castle, even if through the efforts of Lord Brownlow and others this fate is averted, is only one more proof of the urgency of some immediate action for the preservation of our national monuments in their integrity. It may be

urged that we must first decide what is a national monument or object of national interest, before we can protect it, but surely it would be possible to draft some comprehensive definition that could be operative during the completion of a detailed schedule.

We would urge our legislators to take some such step pending the years that must elapse before a full list is prepared. Other nations have long been in advance of us in this respect, and we must endeavour to make up the leeway in the most expeditious manner, even if we have to discard the claims of strictly logical procedure in so doing.

NOTES.

Restorations of Ancient Rome.

In our Historical Review we illustrate M. Bigot's comprehensive restoration of Ancient Rome. In connexion with this, it may not be generally known that in the Walker Art Gallery at Liverpool there is a very good model of that portion of Rome surrounding the Forum as it was presumed to appear at the Imperial epoch. While this model does not quite accord with the results of more recent archaeological researches, a comparison between it (see front page of this issue) and the one prepared by M. Bigot (see plate) will indicate that it gives a very fair general impression of Rome as it was, and that it is worthy of careful study by those who contemplate visiting the Eternal City, as preparatory to the fuller information to be found in the exhibition at the Piazza del Terme.

The Problem of Ventilation.

THAT the science of ventilation has by no means reached finality, has long been obvious, and while we cannot agree with all the conclusions at which Mr. Leonard Hill, F.R.S., arrived in his paper read before the Physiological Section of the British Association, his remarks certainly point out some of the considerations that are too apt to be neglected in the study of the essentials to good ventilation. That chemical purity is not the only factor was emphasised by Mr. Hill in drawing attention to the fact that temperature, movement, and humidity also had a marked influence. A cool, moving, and dry atmosphere gives vitality and energy, a still, heated, and moist one, a sluggishness and relaxed sensation. For those concerned with the design of buildings the problem is inextricably involved with that of heating; how is sufficient warmth to be economically maintained, while at the same time air is supplied sufficiently cool to be pleasant to breathe? The questions of humidity and movement are minor ones, that of temperature has never been thoroughly solved. When it is, ventilation will have taken a great step towards reproducing the healthy and pleasant conditions that obtain in the open air on a day that is termed "bracing."

Influence of the Sun on Buildings.

THE expansion and contraction of building materials as the result of temperature changes is not always realised by architects quite so fully as it should be. In ordinary

circumstances no particular harm is caused by expansion and contraction in buildings, although plastering and cement stucco or rendering are very apt to suffer unless suitable precautions are taken. An instructive illustration of the deformation caused by the rays of the sun is furnished by the Washington Monument in America. This lofty structure daily suffers deflection owing to temperature variations, the movements being indicated by a copper wire, 174 ft. long, suspended in the middle of the column and supporting a plummet in a vessel of water. It is stated that at midday in summer the apex of the structure, 550 ft. above ground level, is shifted some hundredths of an inch towards the north by expansion of the stone. The effect on metallic structures is naturally much greater, a fact brought home to us when walking across the Forth Bridge the day before that work was opened by King Edward VII., then Prince of Wales. On that occasion the expansion gauge on the middle girder span marked the elongation of 1 in. as the effect of the winter sun for the period of not more than one hour.

New York Building Code. SINCE the presentation of the conflicting reports of the 1909 Committee the existing building code of New York City has been under careful consideration by a Joint Committee, comprising representatives of the American Institute of Architects, the American Institute of Consulting Engineers, the Building Trades Employers' Association, and the New York and the National Boards of Fire Underwriters. It is satisfactory to learn that the Committee of Aldermen have shown a disposition to work with the Joint Committee and to accept their advice on technical matters. Political influences and the tactics of firms interested in different and rival structural materials and methods may probably cause some complications, but it is to be hoped that the city authorities will set their faces against all considerations save those based on technical grounds, and that the new building code may be one worthy of the great city for whose benefit it is intended. We can quite understand the attempted interference of rival commercial interests, but the introduction of politics into the settlement of technical building regulations is beyond comprehension on this side of the Atlantic.

Stonehenge and Cyrene.

THE mystery which veils and the wonder that still englamours the place and structure of Stonehenge are at once partially dispersed, and just by so much enhanced, by a recent discovery. Professor Richard Norton, of Harvard, investigating ancient Cyrene, the site of the capital of Cyrenaica, a little-known country to the west of Northern Egypt, has discovered an assemblage of monoliths so similar in workmanship and structure to those of the outer circle at Stonehenge that he feels justified in identifying the civilisation which made both. From this and other discoveries at Cyrene the Professor has formulated a theory that Stonehenge is perhaps the finest known witness to the existence of one great race, or, at least, one common religion, extending over all of what was

LONDON NEW BRIDGE

WATERLOO BRIDGE

(From Professor Jenkins's "Bridges.")

in Roman times called the civilised world—a race and religion to which his findings in Cyrenaica also belong. We know little of Cyrene and the surrounding country. It lies to the west of Egypt, and is bounded by the deserts and the Mediterranean Sea. It was colonised by the Greeks at about 650 B.C., which does not imply—rather to the contrary, in fact, since the Hellenes were conquerors for choice and pioneers seldom, if ever—that the country was uninhabited till then. Professor Norton's discoveries indicate that it was peopled by a neolithic race of considerable culture, as the stone images and carving, evidently of the date of the monoliths, betray exceptional skill. The association of Stonehenge with Greece rests, too, on the strong probability that they are contemporary—belonging, that is, to the late Neolithic period. Sir Norman Lockyer's remarkable investigations in 1901, by which he discovered that the true axis of Stonehenge was planned to pierce the sun as it rose, two diameters from its present point, on the longest day 3,581 years ago, make the date of Stonehenge 1680 B.C. And, although as yet exact astronomical observations have not been brought to bear upon the temple at Greece, all indications go to prove that they were of the same age and built for the same purpose—the worship of the sun. The

gradual unearthing, through the combined efforts of all the learned sciences bearing upon the remote past, of a synthetic worship amid surroundings of inalienable solemnity, of the one cause and condition of all life, origin of all the forms of Zeus, as it becomes increasingly more clear, has but the effect of adding to rather than detracting from the marvel and fundamental sanctity of the temple on Salisbury Plain.

THE STORY OF THE BRIDGE.

BY WALTER SHAW SPARROW.

VI.—STONE BRIDGES AND SOME PROBLEMS.

IN reading the history of this subject one is troubled by half-a-dozen questions that flash into the mind repeatedly, and find there no answers based on authorities. To what extent were the ancients guided by mathematical theories and calculations in their practical dealings with the high mechanics of arched bridges? Did they start out from the point of view, afterwards held and explained by Bacon, that experience was the only safe guide to success in practical work? Were some of them at all like the great mathematicians of the XVIIth and XVIIIth centuries, who often passed by experience and observation, founding their analytical research on hypotheses which were contradicted by events and by experiments in craftsmanship? Was there among

the Romans such a man as Leibnitz, who in 1691, solved the problem of the catenary curve, showing that this was precisely the curve which an arch ought to have if its materials, infinitely small and of equal weight, were to rest securely together in equilibrium? And was there a Roman Bernoulli, or a Roman La Hire?

Unfortunately we cannot get at all near to the scientific art of bridge building, if this thing appealed to the Romans hours of speculative talk. Vitruvius does not help us here. But if we can take for our criterion of what was probable and likely from the general character of the Roman genius in action, then practice in bridge building was the only recognised guide, just as success or failure in war was the only recognised test of a general and his troops. Practical traditions, traditions formed a discipline of craft laws, and these things, passed on from generation to generation, were familiar to all good masons, so that architects and engineers had at their beck and call a body of workmen thoroughly conversant with those stern facts of practical mechanics that the winnowing experience of centuries had kept and treasured for the common use. Roman bridges and aqueducts, still extant though sometimes in ruins only, belong to periods often wide apart in date, and from their family likeness we can infer with safety that in this perilous work, subject always to the waywardness of storms or the devastating power of floods, and the vibration of heavy traffic, sound conservative methods were the rule, little store being set on experiments in cheaper ways of attaining the same measure of convenience. It is

Ponte Rialto, Venice, built between 1588-1591. By Antonio da Ponte.

[Photo. by Erith.]

markable, for example, that, although the masons took infinite care in the making of their cements, they mistrusted mortars of any kind in bridge arches, preferring to use a huge aqueduct such dimensions and proportions of its parts as would enable it to stand firmly without any cement at all between the joints of its masonry. Experience had taught them, we may believe, that slow-drying mortars were very com- missible, and that quick-setting cements could not be used without risk in heavy masonry, because of the time which must elapse between their use and the bedding of heavy stones in their places upon it. They must have known, too, that when mortars are used in a bridge there should be no more in any joint than just enough to hinder the contact of stones, and to exclude the water without harm to an even bearing. To the work without mortar was a com- pulsive discipline that made thorough craftsmanship a habit, and how perfect this discipline with dry stones could be in man's hands is very well shown in a story which concerns the giant aqueduct of Segovia. The arches of this great monument were

[Photo. by Stengel, Dresden.]

Ponte S. Trinita, Florence. By Bartolomeo Ammanati (1511-1592).

a quiet practitioner like Isambert, whose art was a rational application to special needs of thoroughly tested old methods and traditions. Perronet's self-confidence was so great that his operation of striking the centres of the bridge at Neuilly, by removing

the arches sank 23 in., showing that his mathematical resolutions without excellent mason's work were dangerous and humiliating. Smeaton, in a more tragic way, had to learn the same lesson from his disastrous bridge over the Tyne at Hexham, and learned engineering did not save the Tay Bridge from catastrophe. One could name many other examples of bad work, all arising from self-conscious and theoretical habits of mind passed on to the XIXth century by the spirit of late Renaissance art. Is there not more in rule of thumb than in rule of theory?

To study the worth of local traditions we have only to take a tour through Wales, where, as late as the second decade of the last century, the master mason of every district was able to build a good sound bridge, obeying traditions probably as old as the mediæval bridges at Llangollen, Brecon, and Holt, near Wrexham. And much of the work done is useful to ourselves for the lessons that it teaches. Welsh masons were never ashamed of scabbled faces to their stone bridges, nor of rough natural textures; their economy went hand in hand with good taste; while we for a long time have spent many thousands of pounds on daintily-finished craftsmanship that looks tame in a pile of ordered masonry. I have never seen a genuine Welsh bridge that did not add romance to a fine landscape setting, and I wonder always why Englishmen have failed to keep their old fondness for a bold handling of stone in bridges. Remember the feeble affectations that try to look architectural in the coupled columns to Waterloo Bridge. Rennie, like Telford wished to be architectural, and he was encouraged by the example set by Perronet. But Rennie and Telford were engineers, and never once did they achieve success in their efforts to be architects also. It was not in

"Palladian" Bridge, Prior Park. Built by Ralph Allen (circa 1750).

were taken down during the wars of the XVth century, and Isabella the Catholic had them reconstructed in the best manner of her age. Less than three centuries later the reconstruction gave way, necessitating their restoration, while the untouched masonry work remained a prodigy of youth and heroic old age. Marshal Ney visited the aqueduct in 1808, and when he saw the startling contrast between the old work and the new he pointed to the modern part and said, "The labour of men begins there!" or the Roman arcades seemed like the work of gods.

The most pitiful things in human "progress" are the dry rot of theories and the power of cheapness that eat their way into the vitals of craftsmanship. In the XVIIIth century a disease of theoretical speculation took a firm grip on the technics of bridge building; no work of importance was done without interference from library mathematicians, as well as from infinite talk and dissipation. Greater ado could not have been made if a successful bridge had never been built in the history of the world. And what good came from all the fusian of theories? Perronet was regarded as the most scientific bridge-builder of his age; his knowledge was said to be prodigious and his gift of writing enabled him to be persuasive as well as scientific and learned. Yet his work was accompanied by blunders which in the Middle Ages would have shamed

the immediate support of the arches, was begun eighteen days after the keystones had been put in their places, when the mortar had not yet become hard enough to bear new pressure without yielding. The crowns of

their nature to do what Ammanati had done in the finest bridge of the Renaissance, the Ponte della Santissima Trinità over the Arno at Florence, where the graceful and rhythmic arches have curves which are cycloids. Their rise from the springing level to that of the crown is only a trifle more

than one-sixth the span, while the roadway above, though starting from approaches which are but moderately raised, has a mild gradient admirably suited to the needs of town traffic. The piers are in excellent proportion, and their stern cut-waters are useful foils in an architectural design un-

rivalled among bridges for its blending of lightness with alertness and supple vigour. Yet one Victorian expert, William Hosking, in 1842, tried to prove that the piers were too massive, but he was laughed at by architects, who said that Ammanati alone could have improved the noble design.

Paris Bridges from St. Gervais.

[Photo, by Frith.]

The fact is that from the XVIIIth century war engineers were for ever busy with objects for reducing the size of bridge piers, and in this they were partly right and partly wrong. They were partly right because the medieval system of using piers as abutments had many disadvantages, though necessary those days either for military reasons or to deepen the river up-stream. Old London Bridge was such a dyke, and all medieval bridges of any note could be used for defensive purposes in any part of their rise without much risk to adjacent arches. On the other hand, monster piers not only interfered with navigation; they formed a dangerous rapid below bridge, they needed flooding water into inundations, and led to the drainage of mediæval towns unhealthily. All these points were noted in the

I hold, then, that modern types of bridge building are all imperfect, and that the next European war will prove this to be so. While engineers have been constructing their hideous metal monsters, and scheming to get in masonry the maximum of strength with the smallest amount of materials, a necessity for defensive preparations has pressed with ever greater urgency on all alert nations, and the result is that ways of communication everywhere are out of keeping with the needs and with the destructive power of modern war. In recognition of this plain fact, what importance need we attach to such details of construction as the relative proportion between the breadth of piers and the spans of arches? Here is a little table to show how the engineering mind has viewed that one point from Roman times to the reign of Victoria:—

Bridge.	Breadth of Piers.	Span of Arches.	Period or Engineer.	Remarks.
	Ft.	Ft.		
Roman	5	33	Roman	Unusual proportions in Roman work. Each pier an abutment.
Antiquarian	11	25	Roman	
Esprit	38	110	Roman	War bridges, with piers acting as abutments.
London	22	115	Mediæval	
Windsor	15 to 34	10 to 33	Mediæval	
Royal	14	72	Mediæval	
Paris	19	106	Mansard	Modern peace bridges, showing their variations from the XVIIIth century to the death of Telford in 1834.
Italy	14	128	Hupart	
Switzerland	10	58	Perrot	
St. James	17	76	Isid. Jones	
St. James, London	23	140	Labely	Modern peace bridges, showing their variations from the XVIIIth century to the death of Telford in 1834.
St. James, London	18	77	Myrie	
St. James, London	14	90	Streaton	
St. James, London	12	72	Telford	
St. James, London	8	65	Telford	
St. James, London	8	60	Telford	

XVIIIth century, and much thinner piers were advocated as if they had no disadvantages of their own. The thrust was to be relieved over the arches to the abutments. There were to be no abutment piers at all, though wars and rumours of wars kept rope in a ferment. Perrott alone protested. He told his employers, the French Government, that it would be prudent, designing bridges for rivers of great width, to introduce some strong piers, which, in case of need, might serve as abutments; they could be placed at distances of three or four arches apart. No recommendation could have been wiser in that; and if we view it as a criticism of modern bridges, what are we to say? We are living at a time when all the great nations of the world are making themselves dykes for the next huge war. Yet the dykes of the world are, as a rule, so unitary that they seem fitted only for everting peace and trade. A single shell could ruin a great suspension bridge; a whole railway system could be paralysed by a few cartridges loaded with modern explosives; and how many stone bridges would bear the loss of an arch apiece without injury to the whole structures? Good heavens! If the black race in the U.S.A. were to produce a great leader, a Napoleon, easily he could prove that a destruction unwarlike bridges cripples an industrial life of society! In short, whatever may be said against the mediæval bridge, it certainly embodied the mediæval spirit, in religion and in war; while the bridges of our own time have nothing whatever in common with that force in politics that needs for its exertion the discipline of vast armies and great navies. But I shall be told, perhaps, that no skill I thought could succeed in making our dykes proof against artillery. This is true; but it is true also of battleships. Yet battleships are made, and rightly made, with defensive armour so as to resist shells with the might that science can invent and prove. Why bridges should be designed without any fitness for the perils of war, if railways and highways counted for nothing in the transport of food and men and merchandise, is a thing that passes all understanding.

PUBLICATIONS RELATING TO THE PAPAL COLLECTIONS IN ROME.

It may not be generally known to English readers that the Papal authorities have of recent years initiated the publication of two important series of works, on a really magnificent scale, dealing with the more important of the treasures in their keeping. The first of these series describes some of the more interesting objects in the archaeological, artistic, and numismatic collections of the Vatican and Lateran palaces, while the second series consists of reproductions in facsimile of the most valuable of the manuscripts preserved in the Vatican Library. A new work was published in each of these series in 1910, and it so happens that both of them possess a considerable interest for architects. The first of them* contains reproductions of all the ancient mosaics in the Vatican and the Lateran palaces. Most of them are now fulfilling their original purpose, being in actual use as pavements, and only a few of the finer ones are placed upon the walls. The majority of them are not, it is true, of the highest artistic value, but they have hitherto been, it is not too much to say, hardly noticed; and this series of fine photographic reproductions—coloured plates are not given, in order not to increase still further the price of a work already somewhat costly—will enable their designs to be carefully studied and adopted by students of decoration. It will be especially instructive to compare them with the many examples of mosaic pavements which have been found in Roman buildings in Britain, which, while far rougher and coarser in execution, are often quite as complicated in design—a fact which may lead us to suppose that the original cartoons were executed in Italy or by Italian craftsmen. We do not, indeed, often get in England the simple scenes which form a not inconsiderable proportion of the mosaics illustrated in the work before us, but find rather a tendency to the use of intricate geometrical patterns, which may be due to the fact that the great majority of the Romano-British mosaics are comparatively late in date, belonging probably to the IIIrd and IVth centuries after Christ, while those preserved in the Vatican may be placed in the IInd and the IIIrd centuries. In the work before us the mosaics are arranged in topographical order, according to the localities in which they were found—first, those from Rome and its immediate suburbs, then those from the country surrounding it (there are hardly any specimens from other parts of Italy); and, finally, those of which the provenance is unknown. First comes the well-known mosaic of athletes now in the Lateran Museum, which is really composed of the fragments of two pavements, found in the two large apses, or credes, at each end of the great central hall of the Baths of Caracalla, which look on to the two palaestrae, or courtyards, where the athletes performed their exercises. Then come various smaller mosaics, most of them coloured, the finest of which is one representing an unswept floor, with a row of tragic and comic masks along one side of it—a favourite subject in antiquity. This particular specimen is especially well laid, and the tesserae are exceptionally small. From the farm of Tor Marancia, on the Via Ardeatina, comes another small still-life scene of fish and vegetables hanging up in a cupboard; this, and several large pavements in black and white mosaic, of a purely decorative character, were found in two ancient villas on this farm, which belonged to Munatia Procula and Numisia Procula, two Roman ladies who lived in the middle of the IInd century after Christ. Hadrian's Villa is represented by a group of well executed coloured mosaics with landscapes; a few fine pavements with geometric designs, however, are still to be seen *in situ* in the villa itself. As far as composition goes, however, the

It will be seen that the proportion has been varied from nearly one-half of the span to a ninth part of the chord. What a war bridge should be at the present time is a hard nut for architects and engineers to crack; but an arched bridge, carried by a new and much lighter type of abutment piers, seems to be least at variance with the common sense of military defence. The subjects chosen for illustration include the beautiful bridge by Ammannati, architect and sculptor, who died in 1592; the Rialto, finished by Antonio da Ponte in 1591; some English Renaissance types, and a striking general view of seven Paris bridges. I do not know whether the piers of a bridge are proper pedestals for figures in sculpture, but the Chatsworth bridge is one example among many of this decorative convention. A flood would wash the statues thoroughly and keep them clean, but this seems hardly enough to account for their position above the cut-waters. The Rialto, founded on 12,000 piles 10 ft. long, is carried above the Grand Canal to a height of 24 ft. 6 in. Its fine arch has a span of 91 ft., and the footway is 72 ft. wide. The design has often been given to Michelangelo, but it belongs unquestionably to Antonio da Ponte, who was chosen by the Senate in a competition against Palladio.

UNIVERSITY OF LONDON.
On October 2 will be opened a course of instruction in sculpture, under the direction of Mr. Havard Thomas, and in connexion with the Slade School of Fine Art.

STAR AND GARTER HOTEL, RICHMOND.
We understand that Mr. W. R. Waters, C.E., F.S.I., and Mr. Harold A. Coombes, successors to Mr. Albert Chancellor (Messrs. Chancellor & Sons), of Richmond and London, are instructed to carry out extensive alterations and additions, at a cost of 30,000., to the hotel, which has just been purchased after having been closed for some years. The hotel represents an inn established on the site, and with that sign, in or about 1738. A fire consumed the older part of the hotel forty years ago. Of the present buildings the banqueting-house was erected in 1864-5 after plans and designs by E. M. Barry, R.A., the pavilion or ballroom, with the gallery, was added by C. J. Phipps.

"Monument to the Glory of the Independence of a Great Country." Design by M. René F. H. Mirland. Awarded the Grand Prix de Rome.
(From *l'Architecture*.)

palm must certainly be given to the large octagonal mosaic from the *Thermae of Oriculum* (the modern Otricoli), a town in Umbria, on the ancient Via Flaminia, not far from Narni, where the famous Bridge of Augustus is. It is, as all visitors to the Vatican know, placed to great advantage in the large Sala Rotonda of the Sculpture Museum; and it was completed externally by the addition of other less important mosaics in black and white, probably found elsewhere, which have been exposed to considerable injury from the continual traffic. In the room preceding the Sala Rotonda, the Sala a Croce Greca, which is at the head of the stairs as one enters the Museum, are other smaller mosaics let into the pavement, of which the finest is a coloured mosaic with a helmeted head of Minerva in the centre, found at Tusculum in 1741-6, in a villa popu-

larly, but wrongly, supposed to be the Tusculan villa of Cicero, the site of which, while it cannot as yet be accurately fixed, was certainly a good deal lower down.

Another interesting pavement comes from Lorum, on the Via Aurelia, the birthplace of Antoninus Pius, now marked only by a large farmhouse in the middle of the desolate Campagna; it has no less than thirty-two scenes of actors and masks, a few of which are now exhibited in the Sala degli Animali (a room in the Vatican museum of sculpture devoted in the main to representations of various animals), while the rest are stored away; for the whole pavement, which had at first been laid down in the museum, was so much damaged that it had to be taken up in 1894. Similar damage has befallen a large carpet-like pavement from the *Thermae* at Ostia, which still remains in the Sala dell'

Immacolata Concezione, where the doctrine of the Immaculate Conception was promulgated by Pius IX. in 1854. It is, however, difficult to know how else, except as pavements, large floor mosaics could be effectively exhibited. Placed upon walls they are cumbersome and heavy, and fail of their due effect while their faults of execution become too prominent. On the other hand, as pavements, they have often been altered in shape to fit them to the rooms in which they are placed, and, being liable to damage, they are exposed to the necessity of restoration; and the modern Italian workmen are so skilful that it is often difficult to distinguish repairs from original work in mosaics which are not of the highest technical excellence. Dr. Nogara's patient researches into the records of their discovery have done much to establish the facts in this connexion, and, indeed his text is mainly devoted to the discussion of their provenance and of the circumstances under which they were found, and to an accurate description of the mosaics themselves. Having placed the material at the disposal of students, he leaves to others artistic criticism and the collection of parallel examples elsewhere. It is worth remarking that none of the larger mosaics illustrated in the work before us were found before the end of the XVIIIth century, and that even of the smaller scenes none have been preserved to us from a period earlier than the beginning of that century. We have several drawings of pavements found in the XVIIIth century (hardly any, one would say, from the XVIIth), but it obviously was not thought practicable, or, at any rate, not worth while to remove them bodily and make use of them elsewhere. Ancient paintings, on the other hand, came somewhat earlier into favour—as is, indeed, natural from their greater technical excellence—and such paintings as the *Alcibiades* and the *Rome in the Palazzo Barberini* were removed to places of safety as early as the XVIIth century, immediately after their discovery; while the study of decorative frescoes (as, for example, of those in the Golden House of Nero, under the *Thermae* of Trajan, known, until lately, as those of Titus) began early in the XVIIth century.

The other work, the eleventh of the second of the two series of which we spoke* at the beginning, is of quite a different character. It is a reproduction of the well-known

* *Codices e Vaticanis selecti phototypice expressi iussu Pii PP. X. Consilio et opera curatorum. Bibliotheca Vaticana volumina et. Il libro di Giuliano da Sangallo (codice Vaticano Barberiniano Latino 4424) con introduzione e note di Cristiano Hülsen. 1 vol. text. folio; pp. 1X + 164, seventeen plates. 1 vol. facsimiles, elephant folio, sixty-nine plates, with reproductions on both sides of the page. Leipzig: O. Harrassowitz, 1910 320 marks (161.).*

(From *l'Architecture*.)

ume in which Giuliano da Sangallo, the famous Florentine architect, had gathered together all the specimens of architecture, ancient and modern, which, of what he knew, led him to be of the greatest interest and beauty. It is a volume of seventy-five parchment leaves, originally consisting of five separate fascicles, the formation of which was begun in 1485, but bound up not earlier than 1514 nor later than 1516, the year of Liano's death. His son, Francesco, into whose hands the book fell, made a few additions in the vacant spaces upon some of the leaves, but did not add to their number.

The drawings are very various in subject and execution, but the great majority of them are not sketches, but drawings carefully cut and finished at home with ruler and compasses; and some of them, indeed, are copied from earlier originals by other artists, notably Francesco di Giorgio Martini of Siena. The chief interest was in the study and design of fortifications. With regard to the so-called *Codex Escurialensis*, an almost temporary sketchbook by an unknown artist, the state of affairs is somewhat curious. In some cases it seems clear that Sangallo's drawings have served as a model for the artist who made those drawings—who was, as Hermann Egger has demonstrated in his edition of the *Codex* (see *Classical Quarterly*, vol. III. (1909), 147), a pupil of Domenico Ghirlandaio—so that Sangallo must have actually lent the volume to Ghirlandaio; in others, as in the case of some of the views of Rome, which are common to both, each depends on a common original—a drawing of Ghirlandaio himself. This is all the more strange, as we know that Sangallo was much in Rome; but we find again that he often makes incorrect copies, not taken from the monuments themselves, but from earlier manuscript copies of the inscriptions, even monuments so well known and accessible as the Column of Trajan and the Arch of Constantine in Rome. Further, in regard to accuracy in general, we find that Liano's reconstructions are not infrequently too arbitrary in important details.

But when all this has been said, we still are before us one of the most important series of archaeological drawings that has come down to us from the Renaissance. It is one of the earliest in date, and certainly as fine as any in execution; and its value, not only as an artistic, but from an archaeological point of view, is, therefore, very considerable. We learn much in regard to the topography of Rome from Sangallo's drawings, which are almost the only ones of more than one building which have not completely disappeared—such as a porch, perhaps connected with the Theatre of Marcellus at Rome, or at least situated near it, and of the so-called Torre di Boezio at Pavia.

He alone, too, shows the Arch of Gallienus on the Esquiline in Rome with the two lateral openings which it originally possessed, but which were destroyed late in the XVth

century, leaving only the single arch which is now preserved.

We learn much, too, as to the internal decoration of certain of the early Christian

Plan. Design by M. André J. L. Japy. Awarded the Premier Second Grand Prix de Rome.

(From *l'Architecture*.)

GRAND PRIX DE ROME.

OUR illustrations of the designs of two of the successful competitors for the Grand Prix de Rome are reproduced from *l'Architecture*. The subject was "A Monument to the Glory of the Independence of a Great Country." M. Mirland, winner of the prize, was a pupil of M. Laloux, and was born in 1884. M. Japy, pupil of M. Pascal, was born in 1883. The winner of the Deuxième Second Grand Prix was M. Paul A. Tournon, pupil of MM. Seellier de Gisors et Bernier.

buildings of Rome, now entirely destroyed or modernised—the Lateran baptistery, the Oratory of the Holy Cross (Oratorium Sanctæ Crucis) built on the north-west of it by Pope Hilarius in the latter half of the IVth century after Christ, and of the Pagan basilica of Junius Bassus on the Esquiline, converted to Christian uses at the same period. We possess so few examples of the marble incrustation of this time (S. Sabina at Rome and the Cathedral of Parenzo in Istria) may be mentioned as among the best extant) that these drawings have an especial value from this point of view.

We have, too, numerous drawings of cornices, bases, capitals, and other architectural members (like those of the unknown artist of the first quarter of the XVth century, wrongly called Andrea Coner, whose sketchbooks are preserved in the Soane Museum in Lincoln's Inn Fields, and were published in facsimile in the *Papers of the British School at Rome*, Vol. II.). These Professor Hülsen has spent much labour in identifying; and, indeed, the whole of the volume of text which accompanies the larger volume of reproductions in facsimile bears evidence of his scholarly acumen and thoroughness, both in the introduction, in which he deals with the history of the volume, how it came to be formed, from what sources the drawings are derived, and how it was copied by later draughtsmen (notably by an artist who worked for Cassiano dal Pozzo in the first half of the XVIIth century, and whose copies from it are to be found both in the so-called Coner volume—which must once have belonged to dal Pozzo—and in one of the volumes of archaeological drawings purchased from Cardinal Alessandro Albani, to whom they eventually passed from the dal Pozzo family, by King George III., and now preserved in the Royal Library at Windsor), and in the text, in which he deals elaborately and carefully with every drawing

separately, and with the archaeological, architectural, and artistic information which may be extracted from them.

The improvement of processes of reproduction has fortunately rendered the publication in facsimile of drawings of such importance a comparatively simple, though still a somewhat costly matter; and the more of such publications that can be made the greater will be the service that will be done to students. To compare the various drawings scattered through the public and private libraries of Europe by means of notes is no easy matter, whereas from photographs one can tell at a glance which are or are not identical, or do or do not derive from a common archetype; and from such studies we shall learn, not merely more about antiquity, but more about the history and development of Renaissance art and architecture, and what were the ancient originals which were then the special objects of study and attention. There must have been many pattern-books, the originals of which go back to some architects of distinction, in which were grouped plans and details which students would find useful (the drawings of the so-called Coner, carefully measured, obviously not copied directly from the original, but from some unknown archetype and classified according to subject, form an excellent example); and to discover what these archetypes were, of what they consisted, and by whom they were put together would be of great interest. We must not forget that the so-called Coner was directly copied by Michelangelo in some of his architectural studies in red chalk, preserved both at the British Museum and in the Casa Buonarroti at Florence.

Finally, publication in facsimile is certainly the best method of insurance against fire or theft that could possibly be adopted, and is therefore of paramount importance in the case of MSS. or drawings of value.

MEMORIAL TO EDWARD VI. IN CRATHIE CHURCH.

ON Monday, the King, in Crathie Parish Church, unveiled a memorial to King Edward VI. which takes the form of a marble communion table and an oak screen. The memorial is placed in the east end of the chancel, the table being of Iona marble, white, with veins of green and black. Between 6 ft. and 7 ft. in length, and standing 3 ft. in height, it is arranged in front into three panels, with one at each end, while the table is formed of a solid slab. In the background is a carved oak screen that rises against the wall to a height of about 8 ft. The wood which was obtained from a country house at Leicester, is over 600 years old. The carving is in the late Scottish Gothic style.

The memorial was designed by the architects of the church, Messrs. A. Marshall Mackenzie & Son. The communion table was the work of Messrs. Galbraith & Winton, Glasgow, and the carved oak screen, that of Messrs. J. and A. Ogilvie, Aberdeen.

GENERAL NEWS.

Professional Announcements.

Mr. Theodore Fyfe has removed from Gray's Inn-square, W.C., and his business address will in future be 2, Montague-place, Russell-square, W.C. Telephone: 1322 Central.

Bequest for Bristol Cathedral.

The late Mr. C. Y. Sturge, of St. Augustine's-mansions, Bloomberg-street, Westminster, and of Rodborough Heights, Gloucestershire, who represented Westminster on the London County Council, left an estate valued at 11,237l. gross, of which 9,847l. net personality. He left to the Dean and

Memorial to King Edward, Crathie.
Messrs. A. Marshall Mackenzie & Son, Architects.

Chapter of Bristol Cathedral 1,000l. for any purposes connected with the services or adornment of the Cathedral, expressing the desire, without creating any trust in that respect, that it should be expended wholly or partly either on the completion of the cloisters or in a stained glass window for the nave; and if he shall not have fulfilled such bequest in his lifetime a further 200l. for filling the vacant niches in the south side of the abbey gateway with appropriate articles, in accordance with the scheme prepared by him in 1905 in conjunction with Mr. Walter Reed, Messrs. Frost & Reed, of Bristol.

The Society of Architects.

The Society will be officially represented at the Ninth Architectural Congress at Rome by Mr. Percy B. Tibbs, F.R.I.B.A., Vice-president, and Mr. R. G. Lovell, Member of Council.

The Society will be officially represented at the Crystal Palace Mansion House Conference, October 23, by Mr. Geo. E. Bond, P., President, and Mr. Percy B. Tibbs, F.R.I.B.A., Vice-President.

London Salon of Photography.

The London Salon of Photography has just been opened for a six weeks' season at the galleries of the Royal Water-Colour Society, Pall Mall East. The aim of the Salon exhibitions, as expressed in the catalogue, is to encourage those in whom individual aim and feeling have found expression by means of the camera. There are over two hundred pictures in the galleries. A large number of the pictures exhibited have an architectural taint, although cathedral studies are few. The repainting of Winchester Cathedral has been seized upon by Mr. C. David Kay for a pictorial effect, Pierre Dubreuil shows Notre Dame de Paris in a new setting, and Mr. E. Evans has a bay of the north porch of Bathurst. Mr. John H. Anderson has taken his subject Cannon-street railway-station, Mr. Evershed, Lambeth Bridge, and Mr. Hector Murchison has made a picture out of the chimneys of the Adelphi. Several Salon openings have been arranged, one of the organizers being Mr. Arthur Marshall, F.R.I.B.A., who also contributes a Venetian study to the walls of the Exhibition.

Instruction in Structural Engineering and Reinforced Concrete.

Up till recently no adequate course of instruction was available for students of reinforced concrete, but last winter the deficiency was repaired by the establishment of classes on this subject at the London County Council School of Building, Fernside-road, Brixton, W., the lecturer being Mr. H. Kempton Tyson, the Secretary of the Concrete Institute. The course was a very complete one, and the demand for such instruction resulted in a large attendance and necessitated an extension of the scheme, an elementary theory class being formed and two assistant teachers appointed. Though the subject of reinforced concrete is taught in many places abroad, the course at the School of Building is distinctive in respect to the great feature made of practical work, which is of the utmost importance to a knowledge of theory and the proper execution of the work. Those who seek to gain work are required to take both the practical and theoretical instruction, but the practical part is so arranged that it can be taken independently by builders, clerks of works, foremen, craftsmen, and others who only wish to study this aspect. A complete course of instruction extends over four years, various other classes at the School have been utilised in the preliminary stages, and the opportunity will be taken in giving the necessary instruction in the principles of structural design to show their application to all constructive materials.

Battersea Polytechnic.

The calendar of the Battersea Polytechnic for the new session, which opens on Monday, September 25, gives details of the courses and classes held at the Institution. Full day and evening courses in preparation for the intermediate and final degree examinations in Science and Engineering are offered, and the lecturers in the various subjects are fully recognised by the University of London, so that students attending the Polytechnic may be registered as internal students of the

University of London. In the day technical college, full-time courses are arranged in mechanical, civil, electrical, and motor engineering, architecture and building, chemical engineering and art, the courses covering a period of three years, at the end of which time students passing the necessary examinations are awarded the Polytechnic Diploma. Concurrently with the Diploma courses, students can prepare for and take the Degree courses in science and engineering of the University of London. In addition to the scholarships already existing, the governing body have instituted one of 40l. a year for three years tenable at the day technical college. Evening courses are provided in the departments of mechanical engineering and building trades, electrical engineering, mathematics, physics, chemistry, natural science, photography, art. Special mention may be made of the following new developments:—In the Mechanical Engineering Department the governing body have arranged a course of lectures on "Illuminating Engineering." In the Electrical Engineering Department special attention is being given to the subject of electric traction, and new machinery and apparatus are being purchased in order that the subject may be more fully and thoroughly dealt with. In the Physics Department the course on acoustics for music students will be repeated, and a class in physical chemistry for chemistry students has been arranged. In the Chemistry Department the chemical engineering course has been extended by the addition of a practical class. Attention may also be drawn to the chemistry course for sanitary inspectors.

Provincial Housing Problems.

Evictions have been taking place in Winchester, various dwellings having been declared by the City Council to be unfit for habitation. The absence of alternative accommodation has caused some distress to the victims, but the difficulty will be met in the near future by the erection of eighty-two new dwellings. This seems to be an opportunity not only for a general consideration of the local housing problem, but for the preparation of a scheme capable of expansion to anticipate the demands of the future.

At Coventry there seems to be still more discomfort, in spite of efforts made by the Corporation to provide suitable accommodation. The scarcity of dwellings is said to be so extreme that marriages have had to be postponed until facilities are forthcoming for setting up housekeeping.

On the other hand, there seems to be too much room at Stapleford and Sandiacre, near Nottingham, where the building trade is almost at a standstill. In the first-named township about a hundred houses are said to be vacant, and a local builder can find employment for only a dozen men. Whether this points to overbuilding in the past or to some unusual industrial dislocation is a matter for inquiry. Progress seems assured further north in the county, for the Education Committee propose to build a school to accommodate about 600 children of the parishes of Rildworth and Rufford. This is the result of colliery developments near Rainworth.

Apothecaries' Hall, Blackfriars.

The Society of Apothecaries are about to dispose of some 12,000 ft. super. of their lands in Water lane, in the parish of St. Anne, Blackfriars, having separated from the Grocers' Company, they obtained a charter of incorporation dated on December 6, 1617, with a further charter on January 29, 1685. They thereupon established themselves in Coghiam House, the Lady Howard of Effingham's property, which they adapted for their purposes, in Blackfriars (since Water Lane, and standing on the north side of Playhouse-yard. The Society's hall, dispensary, laboratories, and other premises, as rebuilt in 1676-7, were improved and enlarged in 1786.

Proposed Bridge, Glasgow.

The Corporation are again considering the much vexed question of supplying further facilities for traffic across the Clyde. The Tramways Committee have framed proposals for building a bridge a short distance upstream from Glasgow Bridge to relieve the traffic from Jamaica (north) and Bridge and

Portland streets (south), with an approach from Argyll-street through St. Enoch square, and from Broomielaw and West Clyde-street. That project would involve, in all likelihood, the demolition of St. Enoch's Church in the square and the laying of tramway lines along Buchanan-street.

Tattershall Castle Fireplaces.

The purchasers of these famous accessories to the ruined castle in Lincolnshire have agreed to stop the work of removal until to day (Friday), and will resell to the National Trust if 3,000l. is forthcoming by to-morrow. The sum of 5,000l. will effect the purchase of the castle complete with its mantelpieces.

Property Sales.

The list of properties just placed in the market comprises the fine early Jacobean manor house at Fritwell, near Bicester, Oxon, formerly the seat of the Willes family, and restored and refitted by Thomas Garner for his own residence; Allan Bank, near Ambleside, the home in 1808-11 of William Wordsworth, who there, it is said, wrote the greater portion of "The Excursion"; Broome Park, an estate of 3,550 acres, situated in several parishes between Canterbury and Folkestone, and the original of the Tappington of "The Ingoldsby Legends"; the late Miss C. A. Sullivan's estate, extending over 55 acres, in Fulham, and including Canwarth House, the home of Bernard Lintot, Sir James Lowther (Lord Lonsdale), and Lady Shelley, Broom House, sold to the Hon. Lawrence Sullivan, who married Lord Palmerston's sister Elizabeth, and Broom Farm, whence there was a ferry to the Feathers at the outfall of the Wandle; Blair Drummond, in Perthshire, 7,000 acres, the seat of the late Colonel Home Drummond and of his house for nearly three centuries past; Hodroby Hall, near Doncaster, Lord Galway's seat of 1,000 acres, with a mansion built by Sir Thomas Garrigue, temp. Elizabeth; Poynton, Cheshire, which, having continued in the Warren family for five centuries, was bequeathed to Lady Vernon by the daughter of Sir George Warren (ob. 1801); Burwell Park (1,460 acres), Louth, Lincs, seat of the Listers and birthplace of Sarah, Duchess of Marlborough (on the estate are the ruins of a Benedictine priory founded by John de Hay and given to St. Mary's Abbey, near Bordeaux); and Aldwyth Theatre, built after Mr. W. G. R. Sprague's designs, for Mr. Seymour Hicks, in 1904-5.

OBITUARY.

Mr. W. H. Hill.

The death is announced of Mr. William Henry Hill, B.E., of the firm of Messrs. W. H. Hill & Son, of Cork, and Fellow of the Royal Institute of the Architects of Ireland. Mr. Hill was elected a Fellow of the Royal Institute of British Architects in 1888. Of the more important of the works carried out by him and the firm, we may mention the following:—In Cork and the county—Roman Catholic Church, Cork Lunatic Asylum (1899), Consumption Sanatorium at Streamhill, Doneraile (with Mr. R. Evans, 1908), Council Chamber, etc., Court House, the River Lee bridge, near Queen's College, and premises for the Young Men's Association, South Mall, Cork; repair and restoration of Castlemaquair, Carrigrohane (with new spire), and Movedy churches; Provincial Bank, and Auxiliary Asylum extension, Youghal; Kilbonane Parish Church and new sanctuary; Celtic Cross, Soldiers' Memorial, Gill Abbey; artisans' dwellings for Queenstown Naval Dwellings Company (1902-6); and many houses, villas, and business premises in Cork, Bandon, Douglas, Glasheen, Junishannon, Gill Abbey, Mallow, Fermoy, and around. In Tipperary—Villa residence in Carrigrohane and houses for Lord Barrymore, and the Soldiers' Home (1901). The firm were engineers for the intake installation, service reservoir, and ancillary works for the Mallow Rural District Council at Buttevant (1907).

Mr. E. B. Thornhill.

The late Mr. Edward Baylies Thornhill, M.I.C.E., entered the offices of the London and North-Western Railway Company in 1862, and, after forty years' service, was appointed chief engineer. He retired two years ago. He made the plans for the new docks at Garston, the widening of the railway into Euston, and the reconstruction of Lime-street Station, Liverpool.

EDITORIAL SUMMARY.

THE leading article is entitled "A Quaint Text-Book of 1734," the text-book in question consisting of two volumes of "The Builder's Dictionary," published in that year.

The second leading article, "The Lesson of Tattershall Castle" (p. 293), deals with the mutilation of the XVth-century castle there.

Notes (p. 293) include: "Restorations of Ancient Rome"; "Stonehenge and Cyrene"; "Influence of the Sun on Buildings"; "New York Building Code"; "The Problem of Ventilation."

"The Story of the Bridge," illustrated, is continued in part VI. of this series of articles, stone bridges and their types being dealt with (p. 234).

"Publications Relating to the Papal Collections in Rome" is the title of an article on p. 297.

Illustrations of the 1st and 2nd Grand Prix de Rome Prize Designs are given on pp. 293 and 293.

The Illustrated Monthly Historical Review (p. 303) includes: "Archaeological Restorations by French Architects"; "The Roman Forum"; and Notes.

"The Building Trade (p. 308) includes: "Recent Workmen's Compensation Cases—IL"; "The Trade Union Congress"; "Concrete-mixing Installation"; "General Building News"; "Projected New Buildings in the Provinces," etc.

The greater part of a paper by Mr. Percy E. Nobbs, read before the Royal Architectural Institute of Canada at Winnipeg, is given on p. 312.

In Law Reports will be found a brief notice of the case of "Howlett v. Harrods, Ltd." (p. 314).

THE INTERNATIONAL CONGRESS OF ARCHITECTS.

From the Programme of the Ninth International Congress of Architects, Rome, we take the following particulars:—

Monday, October 2.

9 a.m.—12.—Meeting of Permanent Committee and the General Committee of Organisation for appointment of President and Council, etc.

2 p.m.—Visit of all members of the Congress to the tombs of the Kings of Italy, and to that of Raphael in the Pantheon.

4—7 p.m.—Visit to the monument to Victor Emmanuel II.

7.30 p.m.—Dinner given by the Committee of Organisation to the delegates of foreign Governments and to the members of the Permanent Committee.

10 p.m.—Reception by the Associations of the Artists of Rome, by arrangement with the Committee of Organisation, to all members of the Congress in the rooms of the Associazione Artistica Internazionale.

Tuesday, October 3.

10 a.m.—Meeting of the reporters of the various subjects at Castel S. Angelo 9—12. Visits to monuments and exhibitions.

12.30 p.m.—Lunch given by the Committee of Organisation to the delegates of foreign and national associations.

3—5 p.m.—Inaugural session at the Capitol in the hall of the Horatii and Curiatii.

10 p.m.—Reception by the Syndic in the Capitol.

Wednesday, October 4.

9 a.m.—12.—First meeting of the Congress at Castel S. Angelo for the discussion of special subjects.

12.30 p.m.—Fees for private invitations.

2—7 p.m.—Visits to monuments and exhibitions.

Thursday, October 5.

9—11 a.m.—Second general meeting of the Congress, discussion.

11 a.m.—12.—Lecture by Professor Corrado Ricci, Director of Antiquities and Fine Arts on the Imperial Fora.

2 p.m.—Visits to monuments and exhibitions.

6—8 p.m.—Garden party.

Friday, October 6.

Excursions in the neighbourhood at pleasure. Evening free for receptions by foreign Embassies to the architects of their respective countries.

Saturday, October 7.
9—11 a.m.—Third general meeting of Congress. Discussion and lecture by Professor Stubben on the laying-out of towns.
2—7 p.m.—Visit to monuments and exhibitions.
10 p.m.—Reception.

Sunday, October 8.

Picnic Ottobrata (lunch given by the Committee of Organisation to all the members of the Congress).

4—9 p.m.—Reception by the Minister of Public Instruction in the Casino of the Villa Borghese.

Monday, October 9.

9 a.m.—12. Fourth general meeting of the Congress, discussion and lectures.
2—7 p.m.—Visit to monuments and exhibitions.

Tuesday, October 10.

9 a.m.—12. Closing meeting of the Congress.
2—7 p.m.—Visit to monuments and exhibitions.
8 p.m.—Farewell banquet (by payment of 20 francs).

Wednesday and Thursday, October 11 and 12.

Excursions at pleasure in the neighbourhood. Excursion to Venice. Train leaves Rome on the evening of the 12th.

Friday, October 13.

2 p.m.—Meeting of the Congress at the Doge's Palace. Visit to the Campanile of San Marco.

Saturday, October 14.

Excursion to the Venetian lagoon by invitation of the Town Council of Venice.

Sunday, October 15.

Visit to monuments.

The following excursions have been arranged in the neighbourhood of Rome:—I. Ostia, II. Subiaco, III. Orvieto, IV. Tivoli, and Villa of Hadrian, V. Anagni and Ferentino, VI. Corneto, VII. Castelli Romani, VIII. Viterbo, IX. Cori, Fossanova, Ninfa.

By virtue of a special concession on the part of the Italian Association of hotel proprietors (Roman section) members of the Congress of Architects may, on proving their identity, avail themselves of the reduced charges in hotels. Names of hotels and particulars will be found on the programme.

COMPETITION NEWS.

Manchester Art Gallery.

To-morrow is the receiving day for the designs by the ten selected competitors in this important competition, and architects throughout the kingdom will await with interest the verdict of Professor Blomfield.

Deptford Central Library.

The Public Libraries Committee report having further considered the question of obtaining the services of a quantity surveyor for the erection of the Central Library, and have come to the conclusion that it would be in the Council's interests to communicate with a number of quantity surveyors of repute, to be selected by the Committee, inquiring whether they would be prepared to carry out the above-mentioned work at a remuneration of 14 per cent. of the lowest tender, such fee to include the cost of printing and lithography, also to ask those firms who were prepared to accept the terms mentioned, at what figure they would be prepared (1) to measure up for the various certificates granted during the progress of the work; (2) to measure and adjust variations, on the understanding that when omissions and additions are set against each other on provisional amounts the commission will only be paid on the difference and not on the provisional amounts; (3) to measure for and adjust the final accounts of the building.

School, Tranent, Scotland.

Some time ago Tranent School Board invited plans and estimates for a new school proposed to be erected on the Ormiston-road, Tranent. There were six sets of plans, and after consideration the award was given to Mr. Peter Whitcross, architect, Prestonpans, whose plans, with relative cost of 5,000*l.*, were accepted.

School, Little Clacton, Essex.

A new Council School is proposed to be erected at Little Clacton, Essex. Competitive designs have been submitted to the Committee, who have accepted the designs sent in by Messrs. Tomkins, Homer, & Ley, of 214, Bishopsgate, E.C., and Frinton-on-Sea, and appointed them architects for the new buildings.

INTERCOMMUNICATION COLUMN.

Wind Pressure.

SIR,—A detached public building is proposed to be erected to plans passed by Council. The plans are certified by engineer to be strong enough to withstand any wind pressure the could now get to it. Can the Council ask for it building to be certified strong enough to withstand wind pressure if whole surrounding district was obliterated and this one building left?

Leyton.

TANNER.

ILLUSTRATIONS.

Oxford-circus.

THE illustration shows the design prepared for Jays, Ltd., by Mr. Henry Tanner, which has been adopted by the Crown authorities for the rebuilding of the whole of the circus when the present Crown leases fall in.

The other three segments of the circus will therefore, be rebuilt in accordance with this design.

House and Gardens, Mellerstain.

MELLERSTAIN, the seat of Colonel Lord Binning, C.B., is a very large house of two dates—an earlier house now forming one of the advanced wings of the forecourt on the north side designed by John Adam, father of the brothers Adam, and dating from about 1720 and the main block, the large building shown in the background of the drawing designed by Robert Adam, and containing what is probably the finest suite of ceilings by that architect in existence. On the outside there are no details, and Robert Adam for reasons unknown allowed himself to drop into the bastard Gothic of the XVIIIth century, hence the battlements on a house otherwise of a regular Georgian type. There were no gardens round the house. On the other hand, some 450 yds. to the south of the house and some 90 ft. below it is a large piece of water laid out as a "canal," oblong in plan, with segmental ends and returns and surrounded by beech woods. This canal has now been restored to its original shape, and the object of the design has been to make use of the fall of the ground and to bring the house into touch with the canal in one consecutive scheme, the axis line starting from the centre of the south front of the house and ending at the further end of the canal, a distance of some 765 yds. Advantage has been taken of a hollow in the brow of the hill to form a concave demi-lune with straight returns, and from the foot of this a grass walk 100 ft. wide is to lead down to the steps and balustrade at the near end of the canal. In execution several deviations from the design shown on the drawing are being made by the architect, Professor Reginald Blomfield, A.R.A. The stone used is Black Pasture stone. The contractor is Mr. Millar, of Edinburgh.

Ancient Rome.

THE reproductions of M. Bigot's model and plan of Ancient Rome are in connexion with Mr. Ashby's article on restorations by French architects exhibited at Rome (p. 303).

FIFTY YEARS AGO.

Improved Granaries.

THE agricultural journals of France draw attention to a new system of preserving wheat. It consists of pits dug in the earth and lined with masonry or brickwork, which is afterwards coated with thin sheet iron. The War Department of France, by way of experiment, had 576 quintals (the quintal is 2 cwt.) of wheat buried for the space of 25½ months in such pits; and the result, says the *Economist*, was that the grain was preserved in excellent condition.

MONTHLY HISTORICAL REVIEW.

The Palace of Diocletian at Spalato: General View of Model from the South.

ARCHÆOLOGICAL RESTORATIONS BY FRENCH ARCHITECTS.

GENERAL notice of the Archæological Exhibition, which is being held this year in the Baths of Diocletian at Spalato (May 19), but there is one class of which the excellence and importance is such that they seem to call for special treatment; and these are two splendid restorations in the form of models, executed by two French architects, MM. Ernest Hébrard and M. de la Médière. The former has spent years of persistent, careful work in the preparation of his model of ancient Rome on the scale of 1:400, which is that of the famous Lanciani's great plan, the foundation of the study of ancient Rome at the present day. Not content with following the archaeological authorities available, he has conducted independent investigations into the details, e.g., as to the exact location and nature of the carceres of the Circus Maximus, as to the identity of the temple which occupied the elevated platform above the forum of Titus, etc., so that his judgment may command our respect. This is the place to enter into a detailed account of the model, but a few general remarks may not inappropriately be made upon it.

The illustrations (see plates), due to M. Ernest Hébrard, and, by his courtesy and kindness, give us a perspective view of the model seen from the north-east, and a plan, as yet unpublished, which will respond. The north-east portion of the city, the tableland from which the Quirinal, Viminal, and Esquiline hills descend (including the Baths of Diocletian, the Forum, the Imperial Fora, and a large part of public parks), and also the Janiculum and Vatican, are omitted. We are struck at once by the large space occupied by the public buildings (temples, baths, circuses, etc.), with which gardens are often associated, even in the central portion of the city. We must remember that the great gardens were mainly situated in the suburban districts which are not included in the view of the model. As is shown in the

plan of the city, the growth of Rome given by Dr. Thomas Ashby at the Town Planning Conference last October, almost all the emperors who reigned for more than a very few years increased the number of public buildings, and generally constructed a particular group of them; sometimes they encroached on the Campus Martius, in origin an open flat space by the river on the west of the Via Flaminia (the modern Corso), used as a drill and exercise ground; but often they erected their monumental edifices in more thickly-populated

quarters of the city, and this was especially the case with the successive Imperial Fora.

The period chosen is, indeed, thus described by M. Bigot himself in the brief *Notice sur le Relief de Rome Impériale*, which he has prepared for the use of visitors:—"The city is represented at the middle of the IVth century after Christ, the period at which its monumental aspect attained its highest development. The last great buildings constructed are the Basilica of Maxentius, which

The Palace of Diocletian at Spalato: The Mausoleum.
Restoration by M. Ernest Hébrard.

The Palace of Diocletian at Spalato :
View of the Peristyle in its present condition.

was inaugurated by Constantine, and the Baths of Constantine. The Emperor Constantine brings from Egypt the greatest of the obelisks, which now adorns the Square of S. John Lateran, and places it in the Circus Maximus, and this is the finishing touch. The edicts of Constantine have already dealt a mortal blow to Paganism: the temples are shortly to be closed; those which the fire destroys will certainly not be reconstructed. The churches, on the other hand, are rising from the earth [they hardly fall within the extent covered by the model]. The reign of Julian (360) checks for a moment the fall of Paganism and the progress of Christianity. On the eve of the barbarian invasions Rome has never been so fair." The moment of representation is indeed well chosen; the age of Constantine, while it marks a decadence in the execution of details and in the fineness of decoration, witnessed the solution of problems of construction which earlier builders had hardly attempted, and a new style of architecture begins.

Another point which strikes us at once is the extreme narrowness of the streets. We have to remember that the privilege of driving in a carriage within the city was an exceptional one, conceded to only a very few, and that cart traffic was mainly carried on at

night. The richer citizens went about in litters, the poorer on foot, so that wide streets were unnecessary, and we find narrow alleys like those which are seen in seaport towns on the Mediterranean at the present day. But even the main arteries of traffic seem of inconsiderable width to us who are accustomed to modern roads and vehicles; the standard width of a Roman high-road outside the city is only 14 ft., so that those ancient bridges which are still in use on the modern high-roads are narrower than the rest of the road, somewhat paradoxically, inasmuch as they were slightly wider than the rest of the road in ancient times. The Roman vehicles were obviously narrow, with a width of not much over 5 ft., and long narrow carts are still in favour in the Campagna.

But the narrowness of the streets had another object: to give shelter from the sun in summer and from the cold north wind in winter a fact of which it would seem that the city architects of modern Italy have been entirely oblivious. Modern traffic, and especially motor traffic, demands, it is true, a certain number of broad arteries and open spaces; but it ought to be recognised, at the very outset of the campaign in favour of the better planning of towns, that climatic conditions must be carefully considered, and

that in the south a very broad street, very large square, such as that in front of the new monument to Victor Emmanuel may, unless adequately shaded by trees, be a disadvantage rather than otherwise.

The model shows us another case in which the superiority of the judgment of the Roman architects is clear. At the Ælius, at any rate, and at certain points as well, especially in the vicinity of other bridges, the embanking walls of the Tiber were not, as now, perpendicular though to provide only for the river full, but there were two steps on each, so that, when the river was high, all eight arches of the Pons Ælius came into use; when it was at its normal level three flood arches and the upper remained dry; while, when it was low, the three large central arches were empty but there was always a regular and adequate flow of water between its banks. Now, on the other hand, when the river is low the current is distributed over too wide a bed and at some points mudbanks are formed for several years, indeed, owing to the calculations of the engineers, the left bank of the river at the island was silted up, there was serious talk of filling it up and abolishing it.

One or two other points strike our attention. The enormous Circus Maximus, the long line of the aqueducts crossing the Caelian hill, the more important ones, which came in at the highest level of the Esquiline tableland, (omitted), the walls and towers of Aurelian along the left bank of the Tiber, which are now completely disappeared; but a detailed consideration would take too long. There will no doubt be points upon which Mr. Biggs' opinions may be challenged and discussed, but the conscientious thoroughness with which the work has been done must always entitle them to respect; and it is fortunate that it has been possible to include in the exhibition this magnificent reconstruction, the fruit of years of patient labour of study of the monuments themselves, which for the first time places before our eyes an adequate picture of what we must believe that ancient Rome was. What may be the ultimate destination of the model, it is most earnestly to be hoped that a copy, if not the original, will remain available for study in Rome.

The model is so large that a special place has been set apart for it; but in the devoted to the City of Rome in the exhibition itself there is hung a very fine plan of reconstructed ancient Rome, executed by Chedanne, another old student of the V

The Palace of Diocletian at Spalato : Model of Central Avenue and Peristyle.

Turning to the consideration of M. Hébrard's model* and drawings, which are close by, we find ourselves in a not much earlier period. Diocletian's palace at Spalato must have been almost, if not fully, completed at the moment of his death on May 1, 305; and in it we find the dawn of a new architecture and a new style of decoration. It has a great interest for us, for our own Robert Maunier made it the subject of a monumental work, "Ruins of the Palace of the Emperor Diocletian at Spalato in Dalmatia" (London, 1891), which up till last year held the field as the best attempt at reconstruction available. His plan, though to some extent coloured by imaginary additions and adhering to a presupposed but often non-symmetrical, still holds good in its outlines even after the researches of archaeologists of the present day. Professor Niemann, of Vienna, has recently published a plan and drawings of what he thinks exists, with restorations of portions of the palace; while M. Hébrard has also published a plan, with complete restorations, upon the most careful study, and a convincing hypothesis as far as possible. His drawings, and a model based upon them, were exhibited at the Baths of Diocletian; the drawings, with a text in which M. Zeiller will co-operate, will be published in the course of the present year. Meanwhile, M. Zeiller has written a pamphlet to serve as an explanation of the exhibit (*Le Palais de Dioclétien à Spalato*, Paris, 1911), from which, with the permission of M. Hébrard, the illustrations are taken.

The building was neither a villa in the modern sense, nor a palace in the modern sense of the word, but was a fortified castle, resembling a Roman camp in plan; though M. Zeiller thinks it is not unlikely that the element was directly taken from some town as Antioch (we may add Aosta) to the comparison, both of which probably owe their origin to camps). It was enclosed by an almost rectangular enceinte, with square towers at the angles; in the middle of each side, except the side towards the sea, the south-west, was a gate flanked by two square towers, and there were other smaller square towers, one in each angle between the gate and the angle.

On the south-west side there was a portico, adorned by engaged columns, above which there was probably a balcony. The only exit on this side was a low postern in the centre, leading out to a small landing-place, and communicating by a narrow passage under the *tablinum* to the vestibule. In the centre two blocks of buildings in the north-east half of the enclosure, themselves intersected, roughly at right angles, by two blocks of buildings in the north-east half of the enclosure, themselves intersected by a walk which led round the walls, the space immediately adjacent to the latter being no doubt used for rooms. These two blocks were probably occupied, the one by the imperial household, the other by the servants' quarters, &c.

In the south-eastern half, however, the street did not run on, but at once turned into a peristyle, on the right of which was a sacred enclosure with a temple (now the Baptistery of the Cathedral), and on the left a mausoleum (now the Cathedral). See accompanying plan. Straight on was a circular vestibule, leading to the palace proper; and a passage opened to the domestic rooms, while going straight on the chief entrance-room, the *tablinum*, was reached. A very little remains above ground, but the study and investigation of the ruins, which are far better preserved, enabled M. Hébrard to form a very fair idea of the original disposition of the palace;

was actually executed by MM. Germain and others from M. Hébrard's drawings, on the scale of 1:100.

Palais Dioclétien à Spalato, Vienna, 1910.

The Palace of Diocletian.

Restoration by M. Ernest Hébrard.

and, though the names he has assigned to the individual rooms are not in all cases absolutely certain, they may be regarded as at least highly probable.

On each side of the *tablinum* is a group of six small rooms, deriving their light from a narrow court which separates them from it. These, on the analogy of a similar group of rooms at Hadrian's Villa, M. Hébrard supposes to be guest-chambers. Beyond them, on the north-west, is a large apsidal hall, probably the library or museum, running from north-east to south-west; it was not accessible directly from the *tablinum*, but only by means of the long covered promenade which, on the side of the sea (the south-west), replaced the strong walls and towers of the other three sides. Further on, again, is another smaller hall with an exedra, and then come the private apartments of the Emperor and the baths.

On the south-east the arrangement is not symmetrical, as Adam had supposed, but quite different. The principal hall on this side is cruciform, with its axis running parallel to that of the south-western façade, and an apse at the north-west, and the rooms surrounding it differ in plan from those on the other side; and beyond it, at the south-east extremity, is a self-contained group of rooms, which probably formed the women's quarters.

The Palace of Diocletian contains many remarkable innovations in architecture, such as the use of the arch resting directly on a column in the peristyle, the transformation, in the middle of the south-west façade, of a horizontal architrave into a semicircular archivolt, etc.—though M. Zeiller is wrong

(p. 50) in claiming that it offers the first example of the use of mosaic in the decoration of a dome: we may cite, as an example to the contrary, a nymphaum in the Roman Campagna, near the Via Tiburtina, described by Dr. Ashby in "Papers of the British School at Rome," Vol. III., p. 104. We shall therefore, welcome the forthcoming publication of MM. Hébrard and Zeiller's great work; and we may congratulate the French architectural students of the Villa Médici upon the splendid restorations that two of their number have been able to produce as a result of their studies there, with the hope that British students will one day demonstrate that they are capable of work of a similar character.

THE ROMAN FORUM.

In the *Times* of September 5 and 6 appeared two articles giving an exceedingly interesting résumé of twelve years' work of excavation in the "Foro Romano," based on the report now in preparation by Commendatore Boni in view of the International Archeological Congress to be held in Rome in 1912. Few spots on the surface of the Old World have been the scene for so long a period of an intense and constantly varying political and social life, and, consequently, subject to such frequent alterations in aspect, as these few acres of valley bottom. The greatest caution and experience is thus necessarily required in the work of exploration so as to obtain the maximum of information from the numerous strata of construction laid bare by the pick and shovel, and conclusions based on partial excavation have constantly to be revised in view of more exhaustive search.

It is therefore of great value to have this authoritative stocktaking, often a period of scientific investigation prosecuted with great activity and peculiarly rich in results.

The topics discussed resolve themselves into six heads. The first is the primitive cemetery near the Cloaca Maxima, containing examples of various types of early burial, and so old that it was a surprise to contemporaries even as early as Republican times when a portion of it was discovered in one of the rebuildings of the great sewer. The second is the identification by Commendatore Boni of the remains of masonry, consisting of great blocks of square tufa, intersected by the foundations of the Arch of Titus, with the Temple of Jupiter Sator, and of other foundations hard by with those of the Chapel of the Public Lares, the powers which stood in the same relation to the Commonwealth as the Lares Familiares to the family, representing as they did the reserve of the latent energy of the Roman people.

The third is provided by the massive concrete substructure of fortifications, traceable from the House of the Vestals to beyond the Arch of Titus, indicating the existence of two parallel walls with external towers, probably built by Aurelius in the IIIrd century. This work involved the destruction of aristocratic mansions of the Ist, in one of which a mosaic floor and basement with cubicles for slaves opening out of a central corridor have been identified.

A longer portion of the discussion is devoted to the "Tribunal of Trajan," which Commendatore Boni sees in certain remains found in the centre of the Forum on the same site as those of the base of the colossal statue of Domitian. Among these are two reliefs commemorating the proclamation by Trajan of largesse to the people, which are of great importance from the topographical point of view, for the Emperor is represented as standing in the Forum, and if an agreement can be arrived at as to their interpretation the exact position of many of the surrounding buildings will be determined beyond question. No such agreement is, however, yet established among archaeologists.

Of more archaeological than architectural import is the passage in Commendatore Boni's report in which he deals with the origin of the famous Niger Lapis, which he believes to have been placed as a propitiatory after the discords and bloodshed which occurred at the time of the Gracchi on the site of an old destroyed shrine. This had been carefully filled in with river gravel mixed with sacrificial ash and votive offerings before being covered by the black slab marking a *locus religiosus*, a spot of mourning and illness.

Architecturally, the most interesting passage describes the work done at the Basilica Amilia, which, thanks to the removal of a group of houses, it has been possible to explore—sufficiently, at least, to make it clear that this magnificent structure fell in a single day, as the result, probably, of an earthquake. The tangled mass of material accumulated on the floor is far too bulky to be removed except by slow degrees, but the main lines of the building can now be reconstructed with tolerable certainty from what is uncovered, in the light of the drawings made at the Renaissance of the portions of the façade then still standing. In front of the portico ran a line of fourteen *tabernæ*, richly decorated with marbles, corresponding with the bays of the portico behind, and forming a projecting ground story parallel with the *Sacra Via*. This was the only portion restored in the Vth century after the disaster. The rest was abandoned in despair, but utilised as a quarry first for the decoration of the new Rome on the Bosphorus, and later of the newer Rome of the Renaissance. It appears to have been "divided into three naves by two lines of very large columns of African breccia surmounted by Corinthian capitals. These columns supported richly-carved crossbeams, above which rose another line of slender columns, which in their turn supported the cornice and coffered ceiling. With the exception of a very few broken shafts of columns, still standing on white marble bases, everything lies buried in inextricable confusion. Here and there can be seen the foliage of capitals, pieces of most delicate tracery, and the mouldings of bases, architraves, and cornices. But for the

most part the mass of ruins seems jumbled beyond all hope of disentanglement—the delicately cut acanthus of white marble capitals lies next to a shaft of cipollino, flaking off like leaves from a book, or a great column of breccia, disintegrating into its component parts; and all these are mixed up with the crumbling blocks of the tufa walls." The old pavement was formed of "great squares of Chian and Numidian marble bordered with bands of cipollino."

The *Times* articles close with a well-deserved tribute to Commendatore Boni, not only as a learned and imaginative archaeologist, but as an excellent and withal tasteful curator, "for the Forum is really beautiful, thanks to the skill with which vegetation has been used to hide the scars of excavation, the debris of the least important remains, and, above all, the modern work of necessary restoration."

HISTORICAL NOTES.

An Architect-Painter. ONE of the water-colours in the South Kensington Museum is "The River Orwell, and the Bridge near Ipswich," by James Harrison, who "exhibited landscapes at the Royal Academy, 1827-46." Mr. Ralph Thomas, in *Notes and Queries* for September 9, identifies the artist as one who began life as a painter but found his living in architecture; one of his semi-successes being a design for the City of London Schools, which the Committee awarded the third premium.

Monumental Brasses. ONE of the most interesting features of the Ancient Art Section at the Earl's Court Exhibition is that devoted to the monumental brasses arranged by Mr. Walter E. Gawthorp, F.S.A. (Scott.). There are to be seen also rubbings of various periods and styles, including one after the XIVth century brass to Abbot Delamere at St. Albans, which is of Flemish workmanship. By the way, the Archdeacon of Oldham dedicated a few weeks ago, in Islip Church, Northants, the brass reproduced on this page, in memory of John and Anne Nicoll. It was designed by Mr. T. G. Gawthorp, and engraved in the workshops of Messrs. Gawthorp & Sons, who are now engaged on the restoration of some brasses at Magdalen College, Oxford.

Brass in Islip Church, Northants.
Designed by Mr. T. G. Gawthorp.

An Abandoned City. If any site might have seemed immune from the vulgarity of advertisement would be that strange relic of the past, the abandoned city of Les Baux, slowly expiring on the arid rocks of Provence. But no; one of the most prominent portions of this rocky eyrie has recently been cut into a smooth face and whitened to receive a cold advertisement. Les Baux is one of the curiosities of Europe. In the Middle Ages it was a flourishing city, ruled by a line of war barons, who claimed the kingdom of Arles, the county of Provence, and from whom the Houses of Orange and of Monaco are actually descended. The failure of water, the insupportability of the situation, and the general insecurity, rendering such a lofty perch unnecessary, have gradually reduced the population some 400, a tenth of its former size. But great castle and many of the buildings still remain. Among them are many of Gothic and Renaissance times. The latter include a graceful Protestant chapel, the only example left in France of a Huguenot place of worship. It notably renders Les Baux unique in Europe, though paralleled in Arabia and India, is that most of its ancient buildings are notably large portions of the castle and are cut out of the solid rock, and are, in fact, monoliths.

A City Church. THE Wren Church of Andrew-by-the-Wardour, where restorations have been in progress, will be re-opened on the 22nd inst. In the parish magazine the Rector writes:— "For the first time I am able to see the beauty of the richly-carved roof and its various designs. Right down from east to west to the centre of the slightly domed roof is broken a large circle of deeply-carved flowers and foliage, rivaling in beauty and richness of design the woodwork of Grinling Gibbons himself. Small triangular design surmounts each column which rises from the galleries to the ceiling, and a different design fills each triangle, though they consist in each case of cherubs' heads surmounting designs of fruit flowers. But those which strike one most of the carvings over the centre of each arch. The same designs for these are on both sides of the church. Let me begin at the west end, where keeping watch over the organ is an eagle with outspread wings standing on the open floor. The second design consists of two cherubs holding a large crown over some flowers; the third, cherubs sitting on clouds; the fourth, that of cherubs without wings, with a design of rushes entwined round them, while the fifth design, over the altar, is of a large white dove with outspread wings with a branch of olive leaves coming out of either side of its mouth."

The Penalty of Jerry Building. THE collapse of a wall and roof of a winter garden at the Music Hall at Nice, on Friday last, has resulted in several people being killed. It is thought that the work, which was being carried out in reinforced concrete, had not been given sufficient time to set before the internal fitting had been commenced.

The loss of life through the collapse of structure, though not a criminal offence, reminds one of the early days when such was the case. De Morgan, when making excavations at the tell or mound at the Acropolis at Susa, unearthed a large block of black diorite on which were engraved the Laws of Hammurabi, who lived about 2200 B.C.

This code, which gives the Laws of Babylon at that time, was engraved upon the columns in forty-nine long columns with introductory and concluding texts. Forty-four columns are still intact. Amongst others the laws governing building are given, and provided that the responsibility of unsound workmanship rested with the builder. If the builder erected a house which fell down and killed the owner the builder had to pay the penalty with his life. If one or more of the owner's slaves were killed the builder had to replace slave for slave, and if the owner's son were killed, the builder's own son was put to death. One wonders what happened when the builder had no son! The builder had also to pay compensation for damage to the property or utensils of the owner, and, further, had to rebuild the parts that had fallen down.

FEW of the tourists who visit Roman Paris are aware that, like Arles, Nîmes, and Autun, it possesses its Roman amphitheatre. Excavations made in 1870-3, near the Rue Mouffetard, with its reputation as the resort of cut-throats, brought to light the remains of the amphitheatre, which was situated in the 12th or 13th century A.D., and was the summer residence of the Roman Governor, remains of which are to be seen in the garden of the Musée de Cluny. They were outside the city proper, then, and led to the island in the Seine, and occupied the slopes of the hill, later known as Ste. Geneviève. The ellipse measures 180 ft. by 160 ft., and the structure, though less well-preserved than many other examples, has been extensively and judiciously repaired. After protracted negotiations, the municipality has finally come to terms with the owner of the land, and intends to make the amphitheatre accessible to the public, after clearing the arches of obstructing buildings. Whether proposed to utilise it for a revival of theatrical shows, or for bull fights of the type, or merely for the comparatively low-fights of Southern France has not yet been decided.

"THE steps which the London County Council is taking through its Superintending Architect's Department to further decay in the stonework of that relic of Old London, the York gate, have not been taken a moment too soon, even as it is, many of the features of the stone-carving have altogether disappeared," says the *Antiquary*. "It was the Society for the Protection of Ancient Buildings, with its headquarters in the neighbouring Buckingham-street, which urged the Council to apply preservatives. The Council's information, at the Council's request, that the best method of resisting the decay of stone-work has been found in repeated washings of baryta and lime, with a final wash of ground lias blue lime slaked in water, care being taken to avoid the unsightly appearance left by the baryta treatment. This has been the means used to further decay of the famous XVIIIth-century garden-front of St. John's College, Oxford, work which was finished last year, and the treatment has also been employed with satisfactory results on the tower of Westbury Church and at Codrington Parish Church. It is understood that the water-gate will be treated on similar lines." Whether the cleaning is judicious or not, the immediate effect of the treatment is not satisfactory. After treatment, the structure has been patched by masons, and the Nicholas Stone, who so ably carried out the intentions of Inigo Jones, the old-time shadows have vanished, and the masonry of its mellow if grimy appearance, which has lost some of its fascination.

EARLY last year (writes Mr. R. E. Carr, British Vice-Consul) excavations were started by Government on the site of this marvellous Moorish and pleasure city, built in the 13th and razed to the ground shortly after the battle of Alarcos, and four miles from Cordoba, at the foot of the Sierra, and enclosed in a series of about four terraces, and a large extent of ground. In the 12th and 13th centuries the Hieronymite used the ruins as a quarry for the building of their magnificent monastery close to the city, which is itself now in ruins, and it is believed that a great deal of the marble was burnt by the Moors to make lime. A quantity of interesting carvings carved in stone, for wall decoration, in perfect condition, has been unearthed, as well as broken glass and pottery. The excavations are being carried out with far too scanty funds. Various legends exist of this wonderful place, the ruins of which have been called by the people "Old

Cordoba" from time immemorial, though it was known by the learned to be that of Medina Azahara.

St. Jean, Troyes.

THE old city of Troyes is peculiarly rich in churches of historical and artistic value. Some may be purer in style or more imposing in their proportions, but few present a more varied series of interesting features than St. Jean, whose southern side is seen in the accompanying figure. Its bells rang for the marriage of Charles VI. of France with Isabel of Bavaria, a princess who contributed largely by her selfishness and unpatriotic conduct to the miseries of the Hundred Years' War, and again later for that of her daughter Catharine, who brought as her dowry to our Henry V. no less than the crown of France. Troyes was visited by a disastrous conflagration in 1526, which necessitated the rebuilding or restoration of many of its churches, and thus gave free scope for that school of Renaissance church design which flourished with such brilliance in the district. St. Jean,

Belfry, St. Jean, Troyes.

however, which dates principally from the XIIIth and XVth centuries, seems to have been more considerably worked upon some half century later.

Among its curiosities are the replacing of the medieval tracery in some of its choir windows by Renaissance substitutes simulating a skeleton structure with slender pilasters and pediments, of by no means ungraceful effect, and the picturesque clock turret seen in the foreground of our illustration. The church has recently suffered severe damage by the fall—an event long feared—of the steeple shown in the background. The ancient tower, no longer able to carry the heavy slated timber belfry of a type common in the district, tottered under its load and disburthened itself of it on to the house on the opposite side of the street, on which it rested like an extinguisher, while the bells were deposited in the attic, and the chimney-stack was spitted on the finial.

The Villa of Horace.

EVER since the Renaissance the site of that country villa in the Sabine Hills, which was so dear to the heart of Horace, has been a subject of keen interest and debate among archaeologists. It appears that the French School in Rome has at last discovered its remains. The following is a translation of a note on the subject in the current number of *Archæologia*:

"The researches made to identify the site

of the villa made it possible to place it at Vigna di Corte, in the neighbourhood of Licenza. The excavations carried out in that district have actually resulted in the discovery of sure evidence of the poet's residence there. The finds include fragments of primitive walls and a mosaic pavement of the age of Augustus. The villa occupied the summit of a hill bounded on two sides by the little river Digentia. The dwelling-house was preceded by a garden of considerable size surrounded by arcades. In the centre of the garden a tank, 20 metres long, was found communicating with the river. On the left the imposing remains of a farm are still visible. A *frigidarium*, a large elliptical plunge-bath, and the *calidarium*, have been uncovered. The central building of the villa, containing splendid mosaics, extends as far as the banks of the Digentia. The remains found in the interior lead to the conclusion that it was rich in marbles and mural paintings. A considerable number of fragments of artistic value have been collected."

Unless these splendours were, to any large extent, added by Horace's successors, which is, of course, possible, all this tends to show that his country home was not quite the simple little affair, the unpretentious retreat amid the rusticities of a hill farm, that the genial old Roman poet depicts for us in his verses.

St. Séverin, Paris.

THERE is a half-forgotten corner of Paris on the south bank of the Seine, hard by the stateliness of the Boulevard St. Germain and the gay student life of the "Boul. Mich.," but apart from both, a tangle of tortuous and ancient streets clustering round the Church of St. Séverin. This picturesque district is likely to be dragged from its obscurity and smartened up in conformity with its more up-to-date neighbours by means of a brand-new street driven through its heart. The change hardly seems to be demanded by the necessities of traffic or sanitation, and Paris would lose thereby one more bit of her old-world charm. St. Séverin, which is one of her not very numerous mediæval churches, and has inspired some of Huysmans's poetical pages, has much that is interesting about it. Though it has never been of first-rate importance, its history dates back over a thousand years. It may have been the successor of a chapel attached to the old Palais des Thermes, and certainly existed in the year 700, when it benefited by a large legacy from a certain Ermytrude, a wealthy lady of Paris. Nothing, however, remains of so early a date, and the present fabric consists of a picturesque amalgam of various periods, grouping picturesquely with the surrounding weather-beaten houses, and it is to be feared that when deprived of their companionship and thrust into the garish day of a modern thoroughfare it will lose much of its meaning.

Three bays of the nave are of the XIIIth century, other portions date from 1347 to 1439, and the choir is of the flamboyant work of the late XVth century. The building was not, even then, at the end of its transformations. In the reign of Louis XIV. that great heiress, "La Grande Mademoiselle," in a fit of piety, bestowed a new decoration upon it. A scheme was drawn up by Le Brun, the decorator of Versailles, for turning its Gothic barbarities into something less glaringly out of fashion. Its pointed arches were disguised in a casing of marble, with ornaments of gilded and painted stucco, and a new altar was provided with a baldacchino reposing on eight marble columns with bronze enrichments, and sculpture by Tubu.

More recently still, in 1840, the portal of the destroyed church of St. Pierre-aux-Bœufs was removed from the precincts of Notre Dame and affixed—much restored, and without rhyme or reason—to the façade, to replace, perhaps, its two famous stone lions which gave rise in the Middle Ages to the legal phrase, "*Datum inter duos leones*," found in monkish judicial documents.

St. Séverin, almost alone among Parisian churches, retains some vestiges of a cloister whose arches, partly built up, partly ruined, surround the Curé's sad little garden, its only rival being the "Cloître des Billettes" in the Marais, now the appurtenance of a Protestant place of worship.

THE BUILDING TRADE.

RECENT WORKMEN'S COMPENSATION CASES.—II.

Dependency.

IT is satisfactory to find that the decision of the Court of Appeal in *Keeling v. New Monckton Collieries, Ltd.*, on which we commented adversely (the *Builder*, February 3), has been reversed by the House of Lords. It was a case in which a man had left his wife and children in 1888 and never contributed at all again to their support before he met with his death in 1910, and yet the Court of Appeal had held that as his widow, she was a dependent and could claim compensation from his employers at the time of his death. This finding was based on the presumption of law that a husband is bound to maintain his wife, but the House of Lords have now held that, to render a wife dependent under the Act, this legal presumption does not alone suffice, but must be supported by fact. We commented on the extraordinary burden laid upon employers by the decision of the Court of Appeal, and it is satisfactory to find that the House of Lords should have held it erroneous.

In the case *Jobson v. Cory & Sons, Ltd.*, the Court of Appeal have decided a point under the new Act which had received decision under the Act of 1897, in the case *Williams v. the Vauxhall Colliery Company, Ltd.* (the *Builder*, July 6, 1907). A workman, injured by accident, and having been paid compensation, had had the payments terminated in an arbitration by the County Court judge on the ground that he had recovered. He subsequently died, and his dependents claimed compensation. The proceedings terminating the payments, to which the deceased man was a party, were held not to debar the dependents from claiming, as they have an independent right to compensation, although credit must be given for the sum paid to the deceased as compensation. Of course, the death must have been caused by the accident, but in our note to the former case we pointed out the important bearing these decisions have on policies of assurance. In some policies the claim has to be put forward within a limited specified time of the accident, whilst in others payments are only to be continued for a certain period, and then be commuted, after which all liability on the part of the assurer is to cease. In such cases as the above awkward questions may arise between the employer and his insurers.

Incapacity.

The recent case of *Cory Brothers, Ltd., v. Hughes* (current "Law Reports") is a very unsatisfactory decision from the employers' point of view. On January 31, 1906, a collier sustained an injury to his right hand, and was paid 12s. 1d. as compensation until August, 1908. His employers then found him light work at the same or slightly higher wages than he was earning before the accident. He worked at various kinds of light work until April, 1910. The work he was then engaged upon was of a nature that involved no exertion, but to get to the place of work he had to walk up hill, and, owing to a diseased heart, he was unable to do this, and ceased working, and obtained registration of the verbal agreement made in February, 1906, under which he was originally paid compensation. The employers then applied for a termination of the weekly payments from the time he had ceased working. It was proved that the heart disease had no connexion with the accident, but yet the County Court judge, whilst accepting this as a fact, awarded 10s. compensation as from the date the man had ceased work. The Court of Appeal approved this finding, holding the man to be suffering from incapacity, the result of the accident, and that it lay upon the employers to prove that that incapacity had ceased. The decision appears, however, to have the effect of imposing upon employers a liability for disease if once a man has been injured. Here the man, after the injury to his hand, seems to have had left him some earning capacity; for nearly two years he had earned something at light work, quite

apart from the consideration as to whether the wages actually paid him—which were the same as he had received before the accident—represented exactly his true earning capacity. Heart disease further impaired this remaining earning capacity, but the employers are held liable in nearly the same amount, as when the man had no disease. It is little to be wondered at that employers are every day becoming more chary of employing men not in the finest condition of age and health.

Serious and Wilful Misconduct.

Under the new Act of 1906, as we have frequently pointed out, serious and wilful misconduct on the part of a workman affords no defence to the employer where an accident results in death or serious and permanent disablement.

This extraordinary provision gives rise to questions of extreme complication, as it now becomes necessary to determine whether the act of serious and wilful misconduct takes the man out of the sphere of his employment or whether the misconduct has merely taken place within the scope of the employment. An employer giving strict orders where and how a man shall do his work might reasonably believe that when a man acts in contravention of his orders that man would be outside the scope of the employment and outside the ambit of the Workmen's Compensation Act, but two decisions in the current "Law Reports" will serve to show that the law is not so simple.

In the case of *Harding v. Bryndda Colliery Company, Ltd.*, a collier was employed in the "bogey," a passage above a "top hole," or working, to cut a hole from the "bogey" into the "top hole" to allow gas to escape from the latter. In accordance with rules made under the Coal Mines Regulation Act, 1887, the working, or "top hole," had been blocked up with boards, and it was understood that any man was forbidden to enter a working so blocked. In the course of drilling the hole from the "bogey" the man asked the foreman's leave to enter the working from below, and leave was refused. Nevertheless, the man, who wished to ascertain whether the hole was being drilled in the right direction, entered the lower working and was asphyxiated. The Court of Appeal, by a majority, held that the man's dependents were entitled to compensation, as, though he was guilty of serious and wilful misconduct, he was acting within the scope of his employment. This finding appears to be based upon the fact that when he met with his death the man was engaged in doing the particular operation he was employed to do, although doing it in a manner prohibited by his employers, and the two Lords Justices distinguished this case from that of *Weigall v. South Hatton Coal Company, Ltd.*, where a collier went to a place different from that to which he was ordered and hewed coal there, and was held outside the course of his employment. Lord Justice Buckley differed, and we regret that his view did not prevail. What can be more disastrous to the safety of workmen than to prove to employers that regulations made and enforced for the men's own security can be disregarded and compensation nevertheless be obtained? If an employer instructs a man to do an operation in a particular manner, and the man persists in taking another course, should he not be held just as much outside the course of his employment as if he was doing some totally different operation? The only common-sense answer to this proposition appears to be in the affirmative. For other cases on this thorny question we may refer our readers to *Brice v. Edward Lloyd, Ltd.* (the *Builder*, July 31, 1909), *Pope v. Hills' Plymouth Company, Ltd.* (the *Builder*, July 9, 1910), and *Barnes v. Nunery Colliery Company* (the *Builder*, February 3, 1911). The above were all cases where there was a deviation on the part of the workman from their duty apart from the performance of the particular job in hand, but in *Hopgood v. Olive Partington, Ltd.* (the *Builder*, July 9, 1910), will be found a

decision on the same lines as *Harding's*, where, in performance of the job in hand, a man disobeyed regulations.

Reference to Medical Referee.

The last case we need refer to is *Carroll Harrington & Co.* (current "Law Reports" Paragraph 15 of the second schedule to Act states that "any committee, arbitrator or judge may, subject to regulations made by the Secretary of State and the Treasury submit to a medical referee for report matter which seems material to any question arising in the arbitration." The regulations all contemplate a personal examination of a man by the referee, but in a case where a man had died the County Court judge admitted conflicting medical evidence on a question whether death was due to the accident to the referee, and the Court of Appeal have held that he had power to do so.

THE TRADE UNION CONGRESS.

THE Trade Union Congress was opened at Newcastle on September 4, and continued sittings throughout the week. The delegates numbered 521, as compared with 505 a year, and the membership was stated to 1,662,123, an increase of 14,418, despite withdrawal of the Amalgamated Society of Carpenters and Joiners. In 1909 the membership was 1,701,000, and in 1908 1,776,000.

A novel feature was the attendance of a representative on behalf of the Home Office, Mr. Shackleton, and the Board of Trade represented by three officials instead of one.

Those persons who anticipated unusual interesting debates on the labour problems the day at this Congress will certainly have been disappointed, and a criticism of some of the statements relating to the railway strike is rendered impossible out of respect to the Commission of Inquiry now sitting. Certain aspects of trade unionism in connexion with what strike may be said to be *sub judice* and at present any comment would be unbecomingly.

One point, having regard to the many serious strikes that have occurred during the past twelve months since the last Congress met, however, have struck anyone reading the report of the proceedings, and that the absence of any official and emphatic disclaimer of the many acts of violence and intimidation that have accompanied the strikes. During the currency of such strikes and especially when acts of aggression or violence call for civil or military intervention it is the custom for labour leaders to hasten to assure the public that the trade union workers take no part in *subjugation*, and that they are, in fact, rather the victims of hooligans, who intervene and prejudice the movement. If this be the case, it would appear that the Trade Union Congress afforded the very best opportunity for united public protest on the part of trade unionists against this wanton destruction of property, yet any such expression of opinion is absent from the presidential address reported, and the public are entitled to draw the inference that, even if the trade union members do not actually participate in the recurrent acts of violence, they, at least have not taken the opportunity of deprecating them as furthering their ends.

One other point arises in connexion with the presidential address, in which the President, Mr. W. Mullin, spoke of the suppression of any body of employers declining to recognise the unions. Here, again, the President appears to have purposely shut his eyes to facts only too apparent to the public. One of the chief arguments for the recognition of employers of the trade unions is that the unions favour collective bargaining by providing responsible leaders with whom the employers can treat. Yet what has been the history of many of the strikes of the past two years? The so-called leaders have been repudiated by the men; agreements approved

leaders have been rejected by the men; leaders have been powerless either to force the men or to restrain them within limits. It is also noteworthy that no action was offered of the fact that the way company which recognised the men far from having found its path had, had encountered more unrest and more than any other company.

the intolerance expressed by the part of minorities and the recognition of minorities by any government cannot be overlooked. Mr. Mullin is as having described the conscience of minorities as "the selfish spirit of the trade union," and it is only becoming too clear that the trade unions not only desire to break the rules of the societies and take the initiative in the existence of minorities amongst the members. The present labour unrest is largely a movement of the trade unions to obtain recognition. This being the case, it behoves the union leaders first to set their own order—to down the hooligan element, to control over their own members, to govern by their own constitutions, and to take responsibility for their acts. With so much to be done in these respects revolutionary speeches at the Congress are not only deprecated, but they serve to damage the union cause in the public eye.

presence of representatives from the Ministry of Trade and the Home Office at the Congress was made the subject of rather a heated debate. Having regard to the character of the speeches delivered during the Congress, the presence of Government representatives at such meetings seems somewhat anomalous.

practical business of the Congress is shortly reported. The complete report of the Osborne judgment was called for, the usual motion for nationalisation was carried, the action of the Government in connexion with the railway strike being used as an argument in favour of nationalisation.

attitude of the Congress towards the Insurance Bill was somewhat curious. In the first place, a resolution that the insurance should be non-contributory was carried on a card vote by 940,000 to 825,000. But a resolution that the burden of the workers whose wages are less than £10 should be placed upon the employer and the Government was carried on a card vote of 408,000. Then Mr. Clynes moved a resolution dealing with questions, such as withholding benefit from persons in receipt of compensation, the appointment of a tribunal to adjudicate on the conduct of medical men, but which contained the Congress declares that State should be given according to the needs of industrious people, and therefore that persons with wages below 25s. should be called upon to contribute less than the others, or be relieved of all payment under the scheme. This resolution was carried by a show of hands. Thus, in the first half a day the Congress appears to have advanced from receiving the Bill on a voluntary basis to exempting a very large number from their full contribution or any contribution at all. Mr. Roberts, who opposed the resolution, is reported to have enunciated an extraordinary contention that the Workmen's Compensation Act should be amended to give injured workmen full wages instead of half wages. The labour leaders are slow in appreciating the disadvantage to the present Compensation Act to workers who are not in the prime of life and vigour, and although they have no objection to the dangers of malingering in the unions or friendly societies are content to see soon allow this principle to be applied when the burden is to be imposed on the shoulders.

resolution condemning the method of picketing in connexion with labour exchanges. The working of the exchanges, was the subject of it is stated that some miners' had unintentionally voted against nationalisation.

Brooks's action in introducing a Bill dealing with our disputes, some of the proposals which we dealt with last week, was by the Congress and the Bill itself was rejected.

Compact Concrete Plant.

By the suspension of the standing orders a special resolution was moved and carried congratulating the transport workers and the women's trade unions on the successes they had achieved. Mr. Roberts, the seceder of this resolution, did deprecate any disorder and excesses that might have been committed, but from the debates it is apparent that the general strike is to be the favourite weapon in the hands of the trade unions in the future to the detriment of that far wiser and more worthy method of settling disputes—conciliation. Of late years we have watched with approval the extension of the principle of conciliation, and much has been effected by its adoption, and a better feeling has thereby been cultivated between employers and employees, and it will be a national misfortune if the disastrous strikes of the last twelve months displace the more creditable methods of arriving at settlements in trade disputes. Whatever the immediate results of any particular strike may appear to be, it has to be remembered that they involve a dislocation of trade with evil effects, which in many cases are permanent. The country involved in strikes is losing trade daily to her foreign competitors, and, to quote the ancient fable, the disputants in the end are left quarrelling over the two shells of the oyster, whilst the oyster itself, the trade of the country and the profits from which wages eventually have to be paid, has passed into other hands.

The trade unions have useful functions to perform, and, as we have always admitted, perform certain of these functions well; under the Insurance Bill their administrative capacity will further be called into the public service, and it will be a matter for regret if ever they convert themselves into purely militant political societies. We have before observed that the debates at these Congresses hardly do the trade unions justice, and that, as at present conducted, they are detrimental rather than otherwise to the cause of trade unionism. On the present occasion, for instance, a serious debate on the Insurance Bill, and especially on that portion of it which relates to unemployment benefit, might have proved of considerable value and a welcome substitute for the discursive utterances on all kinds of questions which have characterised the proceedings at this Congress.

A COMPACT CONCRETE MIXING INSTALLATION.

THE plant illustrated on this page was specially designed for use in the construction of a building in a busy street and where storage accommodation could not be provided in the customary way. The object of the arrangement was to enable the contractors to prepare concrete rapidly and economically, at the same time guarding against delays due to lack of materials and against inconvenience from excessive quantities of materials.

As may be seen by the sketch, the plant consists of a framed structure including two construction towers, one for hoisting sand and the other for hoisting aggregate. In the middle, a bunker divided into two compartments, each with a discharge valve at the bottom of the hopper, receives the sand and aggregate, and delivers these into the concrete mixer below, which in turn discharges its load into a hopper, feeding trucks for distribution of concrete to different parts of the site. The storage capacity of the sand bunker is 25 cubic yds., and that of the aggregate bunker 50 cubic yds. The hoists and mixer are operated by electric motors.

Sand and aggregate are delivered by waggons with bottom discharge into the shoots shown, and at the foot of these they are raised by the two bucket elevators and discharged through shoots into the bunkers. The hopper below the mixer has the capacity of 4 cubic yds., thus providing a small reserve of ready-mixed concrete. Each elevator has the capacity of 85 cubic yds. per hour.

The arrangement is one of a type which may be found useful by builders having occasion to undertake reinforced concrete construction in cities and large towns.

"PEACEFUL PICKETING."

THE council of the Builders' Merchants' Alliance (Limited), after considering several cases of picketing, have agreed that the following resolution be sent to the Home Secretary:—"That the attention of the Government be called to the violence and disorder occasioned during the recent strikes by the intimidation of willing workers under the guise of peaceful picketing."

GENERAL BUILDING NEWS.

CHURCH, PLYMOUTH.

The Bishop of Exeter recently laid the foundation-stone of a new church at Cattedown, Plymouth. The church is being built by Messrs. W. Cowlin & Sons, of Bristol, from a design by Sir C. A. Nicholson, of Messrs. Nicholson & Corlette, London.

SECONDARY SCHOOL FOR GIRLS, DARLINGTON.

The new secondary school for girls, erected by the Darham County Council in Cleveland-avenue, Darlington, is now completed. The front elevation is of red brick, with freestone facings, and the interior of the building is heated with pipes from a large boiler in the basement, while the lighting is done by electricity. The building has been designed by Mr. W. Rushworth, F.R.I.B.A., the County Education architect, who has also supervised the erection of the school. The general contractors were Messrs. R. Blackett; the heating engineers, Messrs. W. Richardson & Co.; and the interior furnishing has been carried out by the North of England School Furnishing Company. Messrs. Cox Walker put in the electric-light fittings. Messrs. H. W. Bulmer, of Durham, and Mr. J. Chatterton, of Gateshead, were the clerks of works. The cost of the buildings, including electric lighting, heating, ventilating, tar paving, and the laying out of the grounds, was 11,862.

COUNTY SCHOOLS, ECCLESTON.

New County Council schools for the village of Ecclestone, near St. Helens, have been opened. The schools, which have accommodated for 100 boys and girls, have been built from plans by Mr. Littler, county architect, at a cost of 2,600, consist of three class-rooms, marching space, entrance halls, cloak-rooms, and teachers' offices, all on the ground floor. The building is one story high, faced externally with Ravenhead rusticated brick. The work has been carried out by Messrs. Jno. Rothwell & Sons, contractors, St. Helens.

NEW SCHOOLS, SUTTON VALENCE.

In the latter half of the XVIIth century, William Lambe, citizen and Clothworker, (who built the water-conduit near Holborn), founded a grammar school at Sutton Valence, Kent, which he placed under the conduct of the Clothworkers' Company. The Company continued the management of the school until about a year ago, when they transferred it to the United Westminster Schools, and agreed to contribute towards the cost of rebuilding the premises. The new buildings, erected by Messrs. Wallis & Sons, Ltd., of Maidstone, at an outlay of 30,000, after plans and designs by Mr. H. Percy Adams, were opened two or three weeks ago by the Archbishop of Canterbury.

HIGHER GRADE SCHOOL, LEVEN.

This school has been reconstructed from the plans prepared by Messrs. Haxton & Walker, architects, of Leven, and the additions include a central hall, suite of modern class-rooms, laboratory, and art-room. The work was carried out by the following contractors:—Masons, Messrs. W. Black & Son, Kirkcaldy; joiner, Mr. L. Swinton, Leven; plumbers, Messrs. Mills & McDonald, Edinburgh; plasterers, Messrs. C. Neaves & Son; slater, Mr. T. Black, St. Andrews; glazier, Mr. W. Allan & Son, Edinburgh; tile work, Messrs. H. Carron, Kirkcaldy; electrical work, Mr. O. Melville, Kirkcaldy; steel work, Mr. D. Haig, Kirkcaldy; heating, Messrs. James Combe & Son, Glasgow; painting, Messrs. J. C. Rolland & Son, Leven.

NEW SCHOOLS, STANWAY.

These schools have been erected at a cost of about 3,394, from plans prepared by Mr. J. W. Starr, F.S.I., architect, of Colchester. The work was carried out by Mr. Charles Deaves, contractor, of Bures, and the schools were opened last week.

NEW SCHOOL, UPPERMILL

The plans for these buildings have been prepared by the county architect, Mr. Graham, and the estimated cost of the whole work is about 4,500. The accommodation provides for about 250 scholars.

NEW SCHOOLS, DUFFRYN, EBBW VALE.

The estimated cost of erection of these schools is about 15,000, and the plans were prepared by Mr. Henry Waters, M.S.A., architect, of Ebbw Vale. The bills of quantities were taken out by Mr. Stanley Hatchings, of Risa; the electrical engineers, by Mr. W. Horsfall, A.M.I.C.E., of Ebbw Vale, and the general contractor was Mr. A. J. Colborne, of Swindon.

SWANSEA RAGGED SCHOOL.

Messrs. Thomas, Meager, & Jones are the architects of this new building, which is being

erected to take the place of the old school. The contractors for the work are Messrs. T. D. Jones, and the old building is to be demolished in order to extend the Central Police Station.

SCHOOL, GARW VALLEY.

A new school has been opened in the Garw Valley. It is designed to accommodate 156 infant scholars, and comprises four class-rooms, opening into a central hall; cloak-rooms are provided, as well as teachers' and caretakers' rooms, stores, etc. The floors of the class-rooms and central hall are laid with wood blocks, whilst the floors of the cloak-rooms, corridors, etc., are of adamantine tiles. The exterior of the building is faced with local stone, with Forest of Dean stone and brick dressings, the roofs being covered with North Wales slates. The building was designed by Mr. D. Pugh-Jones, F.S.I., county architect, Cardiff, under whose supervision the works have been executed by Messrs. E. W. Lougher & Co., of Pontycymmer, at a cost of 3,177. Mr. Thomas Roberts, of Pontycymmer, acted as clerk of works.

SCHOOL, HORWICH.

The foundation-stone of the new Lord-street Council School has just been laid. The school is being built at a cost of 4,000, furnished, and is to accommodate 400 infants. Mr. W. J. Slater, of Horwich, is the contractor, and Mr. Henry Liddler, of the County Education Department, the architect.

SCHOOL, RAINWORTH, NOTTINGHAM.

The Nottingham Education Committee have issued the statutory notice of their intention to provide a school for about 600 children at Rainworth, available for the parishes of Bilborth and Rainford. This school is necessitated by the opening up of a new colliery in the district. There will be no competition, as the work will be carried out by Mr. L. Maggs, F.S.I., Architect for Schools and County Buildings.

NEW PARISH INSTITUTE, LOWESTOFT.

Mr. H. C. W. Blyth, M.S.A., architect, of Lowestoft, is the architect for this building, which has been erected at a cost of 4,000, as a memorial to the late rector of Lowestoft, Canon Tupper-Carey, M.A. The institute is a two-story building, comprising a large hall, seven class-rooms, billiard-room, reading-room, etc. The contractors are Messrs. Mobbs Bros.

TRADE NEWS.

The Sheffield Corporation Waterworks Department have just placed a contract for thirty-two patent mechanical pressure filters and auxiliary plant, capable of dealing with a flow of 6,000,000 gallons per day, with the firm of Messrs. Mather & Platt, Ltd., of Manchester.

We are informed that "Ceresit" is being employed by the London & North-Western Railway Company for the waterproofing of two passenger subways at Stonebridge and Bushey; and Messrs. Vickers, Ltd., are about to use it for a large tank, which they are to construct at St. Albans. The tank, which will be of concrete, will be rendered with "Ceresit" mortar varying in thickness from 1½ to 2 inches; the total area of the rendering being 2,022 square yards, for which 500 gallons of "Ceresit" will be required.

The St. Matthew's schools, Tolworth, near Surbiton, have recently been fitted with a number of D. O. Boyd's hygienic ventilating school grates, supplied by Messrs. O'Brien, Thomas, & Co., Upper Thames-street, E.C., and Excelsior Works, South Bermondsey.

Under the direction of Mr. Ronald P. Jones, architect, 7, Stone-buildings, Lincoln's Inn, W.C., the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Unitarian Church Hall, North Finchley.

A clock with two 5-ft. dials, and striking the hours, has been erected upon the Parish Church, at Hartshorne, Boyle's Trent. The work has been carried out by Messrs. John Smith & Sons, Derby, to the general designs of the late Lord Grimthorpe.

Messrs. Samuel Wallrock & Co., have just let upon building lease the site of Nos. 8 and 9, Long Acre, and 16, Garrick-street, W., at a ground rent of over 800l. per annum, for the erection of a block of business premises.

The Derwent Joint Small-pox Hospital, Cumberland, is being supplied with Shorland's patent exhaust roof ventilators and special inlet ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

Messrs. J. & A. Ogilvie, of Union-street, Aberdeen, the makers of the oak screen which forms the background of the memorial (illustrated on another page this week) to

Edward VII. in Crathie Church, have Lo showrooms at Van Straaten-buildings, Little Britain, E.C. This branch of business is under the control of their agent, Mr. J. Edwards-Stevens.

MANCHESTER BUILDING TRADE.

The unrest in the ranks of labour has led to the building trade, and a strike of sections connected with the industry in Manchester is threatened for next month. Do the last few days the Executive Comm. of the National Association of Builders and Labourers has been meeting in Manchester and at a meeting held in St. Michael's School, George Leigh-street, on the 11th inst., it was announced that the masters have been asked to give a minimum of sixpence an hour to all general labourers, of 6d. to bricklayers, labourers, and 7d. to scaffolders, mill iron-fitters, and other special labourers. S. employers are already paying the minimum of 6d., but others are said to have a shilling, under which the men cannot exist their wages until the payment is made, of numerous complaints made against a of the employers is, that they charge men a weekly sum for the use of wheelbarrow.

During the last few weeks over 600 gen labourers have joined the Union, and additional expected this week will result the majority of the labourers in the being union men. Joiners, bricklayers, w cutting machinists, and others are joining the demand for increased pay, and in a speech on the 11th inst. Messrs. P. H. H. (general secretary of the Labourers' Ass'n), J. Cavanagh (Hall), J. Doyle (organizer), E. Donohue (Building Industry Federation), and F. Love (Painters' Union) said all various sections will stand together. The feeling is to declare a strike of all connected with the building-trade if the employers not make a favourable response to the demands by October 2.—Manchester Guardian.

SCOTTISH BUILDERS' FEDERATION.

The seventeenth annual general meeting of the Scottish Building Trades Federation held in the Imperial Hotel, Aberdeen, on 8th inst., when Mr. David Wilson, President J.P., Edinburgh, presided. The secret Mr. T. Ferguson, solicitor, Edinburgh, presided, in submitting the report, stated the relations with the operatives were satisfactory, but there were indications of an probably as a reflection of what had occurred in other industries. The National Bill had received the careful consideration of the Executive Committee. There was no industry in the Kingdom that had been more adversely affected by recent legislation than the building trade. Believing that Bill would place further heavy burdens on the trade, and that during a period abnormal depression, the committee was unanimous in their opposition.

The meeting considered the subject of contracting. The system was becoming prevalent in Edinburgh and Glasgow, especially in connection with buildings erected by public bodies. Strong protests had been received from Glasgow and Edinburgh associations. Suggestions were made, and ultimately was decided that representations should be made by the federation to the Board of Works and to public bodies in Edinburgh and Glasgow, protesting against the system.

THE LORD MAYORALTY, LEEDS.

Mr. W. Nicholson, builder and contractor of Leeds, has consented to be Lord Mayor of the city for the coming year. Mr. Nicholson is an energetic member of the City Council, and he has been a Past President of the National Federation of Builders and Contractors.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Slaughter house building, Hutchison-street, (2,150l.); Mr. John R. 204, Union-street, Aberdeen.

AMMANFORD.—Amman Valley, and Panrall Schools, (4,000l., 3,000l., and 2,800l.); Mr. Morgan, architect, Spilman-street, Carmarthen. Additions to public school (1,400l.) Architect, care of Clerk, New Malden School Board.

BALLYLESSON.—Medical officer's residence, dispensary (1,560l.) Clerk, Board of Guardians, Linsburn.

BARNSTAPLE.—Workshops, Newport-road, the Barnstaple Cabinet Company. Bedford.—Moravian Church, Queen's Park, Mr. A. E. Allen, architect, 31a, Bridge-street, Barnbury; Messrs. J. Corby & Son, building, Tavistock-street, Bedford.

BEDMINSTER (Bristol).—Catholic school

* See also our list of Competitions, Contractions, etc., on another page

Mr. G. Bevan, architect, 36, Cornhill, Bristol; Mr. J. Bryer, junior, builder, Exeter.
 Suites of offices, Donegall square; Messrs. Blackwood & Jury, architects, 41, Donegall, Belfast. Residence, Malone-road; Messrs. Young & McKenzie, architects, 7, Marlborough West, Belfast; Messrs. Court, Co., builders, Shaftesbury-avenue, Belfast. Warehouses for Mr. William Cleveland Messrs. A. Bulloch & Co.; Messrs. Blackwood & Jury, architects, 41, Donegall, Belfast.
 Church and schools, Victoria. Architect, care of The Congregational Committee.
 Proposed model workmen's dwellings. Mr. George Symon, Surveyor, Blaydon District Council.
 Courthouse and Police Station. Mr. J. E. Fursland, builder, Bristol. Bridgewater. Masonic temple (2,000); Messrs. Sunson & Coulthurst, architects, Exeter.
 Cold storage and ice making building (2,000); Messrs. H. Williams & Co., engineering, 3, Salters Hall court, Kent). Catholic church (2,500); Goldie, architect, 31, Upper Phillimore-gate. Alterations to offices, Wesleyan for Messrs. Goldman Bros. Alterations for Messrs. Bickford-Smith.
 Additions to premises of Messrs. R. Carlisle, wool and seed merchants. Messrs. J. Barbour & Bowie, architects, 5, Buccleugh-street, Dumfries.
 Extensions to public school; Mr. George Gray, architect, Invernesshire.
 Additions, isolation hospital; Mr. Mackip, Surveyor, Cheadle Rural District Council.
 Baths (Bucks). Proposed baths; Mr. Dornier, Surveyor, Chesham Urban Council.
 Four (near Oban).—Rebuilding of Corn Hotel (3,000); Mr. J. G. Harve, architect, Oban and Fort William.
 Brook—Wesleyan Reform School (650); Mr. D. B. Jenkinson, architect, Oban; Mr. L. Brierley, builder, 24, Cross-street, Malsbrough, Rotherham.
 Swimming bath; Mr. J. B. Harve, Surveyor, Davenport Town Council.
 New lecture hall, Sandwith-street, Thomas's Church; Messrs. Blackwood & Jury, architects, 41, Donegall-place, Belfast.
 The following plans have been passed:—Thirteen houses off Northfield-road; Messrs. J. A. & F. Harvey, Workshop, Junction Messrs. Crew & Co. Alterations to Swan Inn, Castle-street; Messrs. T. & D. Whane. Alterations and additions to Aston road; Messrs. Chilton Bros. Addition to warehouse, King-street; Messrs. J. A. & F. Harvey. A plan has been passed as follows:—Three houses, Diddale; Mr. H. Nicholson.
 Lodging-house, Risk-street (215); Mr. James Bell, architect, 8, Merry-Motherwell.
 School (3,000); Mr. W. Rush, architect, Shire Hall, Durham.
 School (1,000 places); Mr. T. Secretary, Education Committee, Urban District Council.
 Emmanuel Parish Hall (5,000); Mr. J. Pinn, architect, Bedford Circus.
 Mr. E. C. Led, builder, Buddle Park. National Provincial Bank of England; Mr. J. H. Brewerton, architect, and chambers, Bournemouth; Messrs. H. Austin & White, builders, Somerset. Picture palace, King-street; Messrs. Henderson & Brown, architects, Wesley street, Bolton.
 Academy (3,000), and additions for schools (2,000); Mr. John Whittall, architect, High-street, Elgin.
 Memorial Church (10,000); Mr. McGregor Chalmers, architect, 85, Foot, Glasgow. Additions to baths; Mr. A. Watterson, Surveyor, Forfar Council.
 Buildings near hospital; Mr. H. Leslie, Clerk, Board of Guardians.
 Clubhouse, Dumbreck-road, for the Castle Golf Club.
 Extensions to tapestry department, Mills (1,500); Messrs. Nicholas & Museum-chambers, Halifax.
 Warehouse, etc., Fluxman-garden.—Waving-shed, etc., Fluxman-garden; Mr. W. Tattersall, architect, 1,000; Messrs. Haslingden. Picture-drome; Messrs. Booth & Son, architects, 42, street, Haslingden; Mr. T. Brown, Whitcraft-avenue, Haslingden.
 Additions to Mount Pleasant

Congregational schools, Messrs. Coussens & Ruthwell, Cambridge road, Hastings. Proposed secondary school for girls; Mr. P. O. Buswell, Secretary, Education Committee, Hastings Town Council.
 Helensburg.—House and shops, Princes and Sheldale streets (4,000); Mr. W. Hunter M. Nab, architect, 121, West George-street, Glasgow.
 Hillingden.—Buildings (1,726); Mr. C. F. Kearley, builder, 31, Carnaby-street, Regent-street, W.
 Hoddlesden.—Winding-house for Messrs. J. Place & Sons, Ltd.
 Hove.—Additional ward block at sanatorium (2,580); Messrs. J. & M. Patuick, builders, Wandswoth. The following plans have been passed:—Twenty-five houses, Tandridge and Tennis roads; Mr. S. H. Burdwood for Mr. T. Richards. A plan has been passed for Mr. A. Carden, for Mr. E. W. Dinick, for a picture theatre, Western-road.
 Hyde.—Additions to dye works, Hyde Junction, for Messrs. Driver, Goodier, & Co. Inverness.—House, Hill-street (2,100); Mr. T. Munro, architect, Academy-street, Inverness.
 Kildermister.—Alterations to girls' school, Coventry street (250); Mr. E. Harris, builder, Kildermister.
 Kilnchapel.—Alterations to public school for the Campbelltown School Board.
 Kingswood (Bristol).—Methodist church (4,000); Mr. W. H. Dinsley, architect, 12, Cleveland-street, Chorley, Lancs.
 Kintbury.—Memorial hall (600); Mr. W. A. Raine, Surveyor, Hungerford (Berks) Rural District Council.
 Leagrave.—School (250 places); Mr. F. Spooner, Secretary, Education Committee, Beds. County Council, Bedford.
 Lindale-in-Cartmel. Enlargement of parish church (1,686); Architect, care of the Churchwardens, Lindale-in-Cartmel Parish Church.
 Lisal.—School (300 places); Mr. T. Samuel, Secretary, Education Committee, Wallasey Urban District Council.
 Liversedge.—Wool warehouse, Providence Mills, for Messrs. Pyrah & Sons.
 Llandudno.—Proposed chancel and chapel at Holy Trinity Church.
 Longside.—School (3,000); Mr. S. Fordyce Anderson, 1, Crown-terrace, Aberdeen.
 Mallow.—Fifteen houses (136, each); Mr. Francis Hegarty, builder, care of the Surveyor, Mallow Rural District Council.
 Manchester. Proposed three branch Carnegie Libraries; Mr. Henry Price, architect, Birmingham Town Council.
 Mansfield, Woodhouse.—School (7,527); Mr. J. Greenwood, builder, Mansfield.
 Middlestone Moor.—Institute (3,000); Messrs. Johnston & Son, architects, Cockton-hill, Bishop Auckland.
 Monkseaton.—Extensions to railway station; Mr. C. Harrison, engineer, Railway Station, Newcastle.
 Monkton (Ayrshire).—School (1,300); Mr. W. W. Reid, architect, Main-street, Prestwick.
 Nantyglo.—Institute and library (1,200); Mr. Neat, architect, Brynmawr; Messrs. Jenkins & Sons, builders, Brynmawr.
 Newcastle.—Block of offices; Messrs. Cackett & Burns Dick, architects, Westgate-road, Newcastle; Messrs. Davidson & Miller, builders, Ridley Villas, Newcastle.
 Newton-in-Makerfield. Isolation hospital (1,800); Mr. A. Bowes, Town Hall, Earls-town.
 Norton.—Pavilion, Norton Playing Field (530); Managers, Sheffield Training College.
 Nunaton. Proposed dining-hall (1,600); Architect, care of Mr. C. Blakeway, Board of Guardians, Nunaton.
 Oban.—Conversion of wool mills into house and public hall; Mr. Hugh M'Dougall, builder, Oban, N.B.
 Oldham.—Schools (6,000), in connexion with St. Mary's Roman Catholic Church, Oldham.
 Portsmouth.—Extensions to workhouse infirmary (42,890); Mr. E. H. Mitchell, Portsmouth Board of Guardians, Southampton.
 Radcliffe.—Weaving shed for the Radcliffe Co-operative Wholesale Society.
 Rathdown.—253 houses; Surveyor, Rathdown No. 1, Rural District Council.
 Redditch.—School (6,450); Mr. A. Vernon Rowe, architect, care of Mr. A. W. Priestley, Secretary, Education Committee, Worcester-shire County Council, Worcester.
 Rhyme (Aberdeenshire).—Extensions to school (2,000); Messrs. Brown & Watt, architects, 17, Union-street, Aberdeen.
 Richmond.—Receiving homes for children (2,740); Mr. Edward J. Partridge, architect, Bank-chambers, Richmond; Messrs. Speechley & Smith, builders, Excessor Works, Richmond.
 Reconstruction of the Star and Garter Hotel; Messrs. W. A. Lewis & W. R. Waters, architects, 11 and 12, Finsbury-circus, E.C.
 Rochdale.—Proposed new General Post Office (2,000); H.M. Office of Works, Storey's Gate, S.W.

Salton Bagthorpe.—Alterations to school, also new school (3,220); Mr. J. Greenwood, builder, Mansfield.
 Sheffield.—The following plans have been passed:—Public wash-houses, rear of Upperthorpe Baths; Mr. F. E. P. Edwards, City Architect, Sheffield City Council. Warehouse, John-street, for Mr. D. Davies. Twelve houses, Linscott-road, for Messrs. Highton & Son. Four houses, Middle-road, for Mr. J. Sanderson. Warehouse, Attercliffe-road, for Messrs. T. Andrew & Co. Eight houses, Riverside-road, for Mr. J. Samuel. Additions and alterations to premises, Bramber-street, for Messrs. Mappins' Mashro' Old Brewery Company. Six houses, Meadow-lane, for Mr. S. Taylor. Five houses, Cruise-road, for Mr. James Samuel. Five houses, Withens-avenue and Overton-road, for Mr. W. J. Pratchett. Four houses, Melrose-road and Couper-road, for Mrs. Annie Taylor. Additions to premises, Stevenson-road, also additions to premises, Livingstone and Bessemer roads, for Messrs. Jonas & Colver, Ltd. Workshop and additions to offices, Bernard-road, for Messrs. J. & F. Hill. Three houses, Dobbin-hill, for Mr. David Davies. Stores and additions to office, Brightside-lane, for Messrs. W. Jessop & Sons, Ltd. Alterations to Old Tontine Hotel, Dixon-lane, for Colonel Sir J. E. Bingham. Sixteen houses, Carnaby-road, for Mr. G. E. Phillips. Three houses, laundry, and assembly-room, Blackbrook-road, for the Ecclesall Board of Guardians.
 Shepton Mallet. Infectious diseases hospital, laundry, and disinfecting block; Mr. A. J. Pictor, architect, Bruton, Somerset; Messrs. Doddimead & Son, builders, Shepton Mallet.
 Shirey Row.—School; Mr. J. W. White, builder, High Barnes Works, General Graham-street, Sunderland.
 Shirley.—Proposed nursery buildings, Shirley Warren (2,000); Architect, care of Mr. A. J. Walden, Clerk, Board of Guardians, South-ampton.
 Sonning (Berks).—Two houses; Messrs. Walker & Harwood, architect, 17, Pall Mall East, S.W.
 South Shields.—Two school departments, Stanhope-road (9,050); Mr. Stephen Sheriff, builder, Back Woodbine-street, South Shields.
 Staverton (Davenport).—Hospital (1,700); Mr. J. B. Williams, Surveyor, Davenport Rural District Council.
 Stockport.—Nurses' home; Architect, care of the Building Committee, Stockport Infirmary.
 Stourbridge.—School (3,450); Messrs. J. Harper & Sons, builders, Blackheath.
 Stowmarket.—Proposed school, King's Meadows; Mr. W. E. Watkins, Secretary, Education Committee, East Suffolk County Council, Ipswich.
 Strathpeffer.—Post Office (2,000); Mr. D. Matheson, architect, High-street, Dingwall.
 Stretford.—Proposed additions to baths; Ernest Warrall, Surveyor, Stretford Urban District Council. Plans have been passed as follows:—Extensions to offices, Trafford Park, for Messrs. Redpath, Brown, & Co. Thirteen houses, Kewwood-road, for Mr. Jos. Holt. Additions to Temperance Hall, Church-street, for Stretford Rebabiles. Works, Trafford Park, for the British Reinforced Engineering Company, Ltd.
 Sunderland.—Proposed training college, Ford Estate, Hylton-road; Mr. H. Reed, Secretary, Education Committee, Sunderland Town Council.
 Swansen.—Proposed factory, King's Docks, for M. P. Alrig, Paris.
 Thornhill Lees.—Proposed enlargement of school (1,000); Managers, Church School, Thornhill Lees.
 Uppingham.—Proposed laundry at work-house; Mr. F. Oakley, Clerk, Board of Guardians, Uppingham.
 Wallingford.—Additions to hospital (350); Messrs. Brasher & Sons, builders, St. John's End, Wallingford.
 Weymouth.—School (5,360); Mr. Gough, builder, Clapham Park.
 Whaley Thorns.—Fifty houses; Messrs. Green, builders, Whittington, Chesterfield.
 Whitley Bay.—Catholic schools; Messrs. Gibson, Steinlet, & Dickson, architects, Camden-street, North Shields.
 Wigan.—A plan has been passed for the conversion of workshop into cinematograph hall, etc., for the Trustees of the Scholes Labour Club, Hen-street, Wigan.
 Wooler.—Alterations to church (4,000); Mr. A. B. Plummer, architect, 13, Grey street, Newcastle.
 Workshop.—Additions to Victoria Hospital (2,012); Mr. J. Doncaster, builder, Workshop.
 Yoker.—Additions to Messrs. Bull's Metal & Melloid Company's works (4,000); Messrs. Warren & Stuart, 94, Hope-street, Glasgow.

CANADIAN ARCHITECTURE.

We take the following from a paper read by Mr. Percy E. Nobbs at a meeting of the Royal Architectural Institute of Canada at Winnipeg:—

"As Canadian architecture is as yet a small affair, though, I verily believe, a thing of mighty promise for the future, I hope I shall not bore you if I deal very little with its facts and rather profusely with its theories. Theories are, of course, invented to help us to 'bear our ignorance,' so I take it they are the proper medium wherein to discuss that which is not yet.

And, before going any further, it is necessary, in justice to those who will disagree with what I have to say, to state the fundamental artistic creed underlying what follows, so that they may at once perceive wherein 'their doxy' and 'our doxy' differ, and leave it at that without further ado, for nothing in this world is less profitable than an argument on matters æsthetic and, I would add, on matters ethical when the disputants erect their relicts on foundations different in kind.

Hedonism and Mysticism.

The epicurean sty in which those wallow who eternally do sing 'Art for art's sake,' and base their æsthetic satisfaction on the mere charm of the senses, is an unavailing quag wholly unfitted to be considered even as a possible site on which to rear our structure. The Hedonistic theory which measures the arts in terms of pleasure has, unfortunately, permeated the literature of the last century, so that it is now in all men's minds; and that is why the public and the artists of to-day are more thoroughly out of sympathy with each other than ever they were since history began.

And even less suited for a foundation do we consider the clouds of mystification where the idealists flap their undisciplined wings in search of artistic delights "too utterly utter" to be expressed by the aid of any known syntax. To come to the point, let me state briefly that art is a simple and natural human activity, not an inexplicable, quintessential mystery, that its purpose is always expression, that the subject-matter of this mode of expression is that whole range and gamut of emotion and sentiment, and that the means employed—the raw material of this expression—is sensuous pleasure. It is by arrangement that this raw material undergoes its transmutation into that very elusive thing called beauty, best described, in the words of Santayana, as "pleasure regarded as a quality of a thing." Pleasure and pain are, as it were, the light and shade of consciousness. Beauty, you see, is just a state of mind. Without producing that state of mind the arts are dumb.

A little illustration will show you what I mean by artistic expression in this context, for there is no art in merely expressing. Such expression merely informs us and leaves us cold. But when form or arrangement enters into the expression its effects are magical. It was many years ago this point was first brought to our attention by an old painter.

"If you are leaving the country," said he, "and sup at a restaurant with the lady of your choice before train time, and say, 'Waiter! Wine list. Thanks! No. 95, Moët and Chandon. That's right!' there is no art, although the mere act of incurring the expense has expressed an emotion; but if you say or sing:—

"Gae bring to me a pint o' wine,
And put it in a silver tassie,
That I may drink afore I gae
A service to my bonnie lassie!"

that is art, and every man with bowels of compassion who hears not only knows just how you feel, but feels that way himself."

Now this is, I believe, a common-sense view of the great æsthetic problem. Any mere bank director, or Cabinet Minister, or dry-goods clerk could by applying it get an infinite insight into the arts, but persons of these classes, as a rule, much prefer, if they design to give arts a moment's attention, to content themselves with what they call their 'likes and dislikes'; to approach the arts, that is, as we approach a bar where mixed drinks are sold, for the sake of just such sensual pleasure. If a building only "pleases the eye," as the phrase is, it fails utterly as architecture. And how many buildings there

are concerning which that is about all that we can say! Now the builders of past generations have succeeded marvelously well, not only to express through what may be called pure design (*i.e.*, structural truth and honest relation between planning and elevating, etc.), but also through the use of ornament added thereto, a wealth of feeling and emotional thought.

Past Ages.

The styles of various periods convey to us the very spirit of the ages that brought them forth. If no Greek or Latin or Early English literature had come down to us we could still reconstruct from extant monuments of Rome and mediæval England, but, what is far more important, the sentiment with which these peoples at certain periods regard life in general. But, more than that, going behind the generalisations of periodic style, we can realise the very spirit in which various types of buildings were wrought, and, more yet, the individual feelings of the individual man who gave character to individual buildings, for architecture is essentially monumental—history writ large and lastingly.

And from such a point of view it is a matter of no small satisfaction to our national interest to realise that at certain periods Englishmen, Scotsmen, and Irishmen had sentiments to express, and a power to express them in no sense inferior to the best in the glory that was Greece or Rome, or Italy or France.

And perhaps our art, so near to nature in the matter of materials and science, so close to humanity in her dependence on social conditions, has expressed better than any other art the peculiar characteristics of nationalities. Certainly, it is the most democratic of all arts; no affair of luxurious personal patronage or public treasure-houses, but a very adornment of popular life, both private and public.

When men have had great feelings to express and great power of expressing them, happily joined with great opportunities, styles have been developed and evolved and brought to perfection, and from these we can deduce something of the everlasting laws and principles of our art in the light of which to model all sorts and conditions of designs.

Think of a real cosy Jacobean dining-room in some old English manor-house. With you, I know, I need not dwell on the elements of such a composition with any searching description. You know how the two great oak beams carry the lesser joisting of the ceiling, and how the plaster is put up between them. You know the mullioned window, with its leaded glazing and iron casements; the broad brick hearth, on which the crimply iron dogs keep quiet company within the delicately-moulded jambs and lintel; the panelling on the walls; the heavy floorboards; the tapestry at the end; the tall-backed chairs; the squat, pot-bellied table legs—yes, you know! And it is all to speak to you of a certain kind of life and character, which, as I am a builder and not an historical novelist, I shall say nothing more about.

Without a gradually-evolved tradition behind it, in those chief matters of scale and proportion and a naturalness in construction, the thing could convey no impression at all. The ultimate laws of design are all respected there just as truly as in the Doric temple or the Early English abbey, the great Italian palazzo, or City church by Wren. The thing possesses an essential unity of its own, not fortuitous or accidental.

Modern School's.

Of schools of architectural thought to-day there are two (and I purposely ignore the claims of the Secessionists and Art Nouveauists to form the third. Let the heathen rage!). The great exponents of the academic school recognise the eternal principles of design and composition, the everlasting unities, and they use for purposes of exemplification and instruction a convenient cut-and-dry set of forms—the Order and arches, etc. They fail utterly to interest their votaries and neophytes in the technique of the crafts. To them a column is a column, whether made of big stones or little ones, plaster wire, lath or pine boards, cast-iron or trelliswork, and their lintel may be one stone or a hundred pieces of terra-cotta. On the other hand, the non-academic school

knows naught of the grand manner, and still less about the abstract proportions of columns, so they are big enough to lay down their work in whatever material they like, their being. Craftsmanship and the regulation of ornament and decorative art are main cares. This they hope to attain to by the study of mediæval technique.

The stronghold of the academic school, of course, the École des Beaux-Arts in Paris, and, as there is wonderfully little but going on in France, its fruits are to be chiefly in the United States of America. And London is the stronghold of the craftsman architect, with his imitation and highly-coloured politics.

Now if the academic school could be induced to pay more attention to the flung vault of Beauvais and the jewelled of Blois there would be more hope for and if the English exponents of architecture could realise that the grand manner, as practised in Egypt and Babylon and the cities of Alexander's Empire—and the Imperial Rome and gay Versailles has that in it?—would impart a discipline to their plan and a coherence to their composition—too, would gain in power of expression, the rival systems are too deeply rooted in its own custom to afford much widened horizons. To come nearer to there is an interesting development going on. The Anglo-Maniacs of New York have challenged the supremacy of the Beaux-Arts influence that in a recent novel the author makes bold to write the following:—

"Architecture!" said Smugg one. "There's been no such thing since that drunk and disorderly Dago tripped a smashed Corinthian capital, and saw it for the first time after he and the rest of 'em had messed around it for a thousand years. There Renaissance you been talking about nothing but a surgical operation for the 'school of thought,' the first idiot 'correspondent' for the suppression of intellect, 'translations and ratios! Men were so crazy their foot-rulers measured rather than their cornice than figure out a new grained arch took brains and blood to build Karnak at Parthenon and St. Mark's and Durham and Chartres! But these modern monkeys are working out puzzle pictures for fools! I would think the Parthenon had gone wrong and come over and littered all over Manhattan Greek temples for bun-shops, Greek temples for subway-entrances, and Greek temples for garages! Judging from the Penny Station, how far have we advanced from Ta Mahal? Is the Singer Building better than the Doge's Palace? And how about that Cathedral that garbage box with the foisted approach? Is it up to the standards any little old parish church in England?"

Oh, I've been talking with these arch chaps and think on a scale of one-sixteen an-inch-to-the-foot, and I know what's there! There's a bucket shop called the École des Beaux-Arts over in Paris, where the little Vandykes and gives up the last bit of small of feeling they have, and they get in rebunch of stock-certificates in a bum good hope, and then they cheat themselves back to the Atlantic, and the hay-seeds of his gurgles. 'Oh, ain't them columns and cornices and cartouches elegant!' That's all they get out of a Roman translation of the Greek! Gawd! Every time I see an old memory of the unknown dead. Yes, I there's a few men trying to do Gothic, they ain't got no Gothic minds. Well, they're butchers at a real style, anyway, and they be pitted, because they know right from wrong, but these academic asses, I envy them. Don't even know there is any such thing as right!"

The great leading influence of McKim American taste has tended latterly toward Roman Renaissance rather than Egyptian models, and from that it is but a step to sobriety of Georgian tradition, the very which is undoubtedly on the increase. Architecture in the States is not a question of evolution of styles, but merely of institution of fashions, and that is a matter wherein we should do well to fall in with our great neighbours by imitating example.

If the true teaching lies, as I believe, where between the Beaux-Arts and the Crafts, we are indeed well situated to develop a sound foundation for the structure of Canadian design. Though French Canadians have a little common with Parisian ideals, they always constitute a channel through French influences, both old and new.

* *Lady Macbante; or, Life as it Should Be* by Gelett Burgess.

our way to us, and we can rely on the Beaux-Artist from across the border let it be his fault if our cities lack of follies, bedight with columns and ches. The English culture of the is also with us, and gives every promise of a strengthening tie to the bond of British ideals. Let us hope that our academically-inclined designers will learn to wrought-iron and cast-iron are perfectly different things, and that if order comes in too high to do their will they will at least take the trouble to draw the details before calling for their in mahogany; and also that the d d crafty ones among us will try and at the meanings of the words "scale" proportion," and apply that known in their efforts in opal glass.

The Growth of Tradition.

tion grows, it cannot be made, and asonable goodwill it might grow very among us. Without tradition we have an art at all, and must contrive with going on being clever. If we can see our way to attaining a art, that is only one matter out of many the future of our art in Canada. ur and artisanship, these are the most aging questions we have to face. Unionism, in its early days, did much out of late it has tended to produce ing slavery, which robs the nations best effort of their sons of toil. I try w and I hope I love my partner, the man, but I feel the realisation of his artistic hobby would destroy utterly as left of the soul he once had in nce.

in and Morris sought to regenerate the through the revival of the happy con- of the Middle Ages, when a man's pride was in his work, as what Time of it to us most clearly shows. But labour has made unnatural laws for to exist by skilled employment or the of the hand has come to be a humilia- Ruskin and Morris failed egregiously. se we architects realise more clearly the people that the working man, when individually, is not as black as he is by any means, and that if his master, tractor, on the one hand, and his the union, on the other, would only n, he would be willing enough to a higher ideal of execution and to think for himself. I have no on in stating that in the ordinary stonecutter, mason, bricklayer, ry, and joiner—this country is rapidly ago to a barbarous standard. Eighty, erty, yes, twenty years ago, all these were better done in this country than e to-day. For neither love nor money get a ceiling put up in Montreal that of crack inside three months, and al has lots of ceilings half a century out a shake in them, and so all

urse, in ordinary work to-day we must o without ornament and decoration quite as much as reward, are able to (labour), except mere enrichment of ost perfunctory, cast-by-the-yard, by-the-mile kind. Yet but 500 to any cottage, any village church had upon it a taste in design and a skill ution which would to-day obtain for or a reputation as a past-master.

Expressing the Conditions.

we must adapt our work to the con- of our age, and do without a great nice things, and, above all, we must be temptation to resort to fakes and ns and shams of better things. That, is the great blot on the taste of o here—that neither architects, nor ors, nor workmen, nor clients, nor leral public seem to resent the most e shams and hypocrites, and it is in ches that the defect of stage carpentry of building is most in evidence. n churches are sometimes well venti- usually well heated, nearly always able, and invariably full of structural erial lies. In notable contrast to the ss and vulgarity of our places of of all denominations is the good and extravagant outlay (and these to not necessarily always have to go

(together) on the banks of most of the financial corporations. I am not here to judge between the tanker and the parson on the question of which vocation is most necessary. Every community builds its best monuments in honour of that which it most reveres; that has been true since the dawn of civilisation. Undoubtedly, the future of Canadian architecture is bound up with the evolution of the banking-hall. There has been no visible effort in any section of the community to advance the art of church building, which has, from the beginning of historic times, been the main problem of the art.

We shall, therefore, expect that the sentiment of unbounded wealth-rolling prairie, limitless forest, and all that sort of thing, converted into barrels, nay, cargoes of gold will not fail to evince itself in Canadian architecture.

Just as the XIVth-century architecture of our race is inspired in the main by the sense of pageantry and chivalry—the zenith of feudalism in all its glory—while the temper of our art in the XIIIth century was by contrast an affair of disciplined monastic refinement, and in the XVth a decidedly bourgeois affair, so we must expect to see a barbaric plutocracy as the backbone of our social system affecting our art just as did the abbot of 1250, or the baron of 1350, or the burgess of 1450. But that is neither your affair nor mine, gentlemen; what is "our affairs" is to express in our designs the temper of the time we live in, and, just for the initiated, a little of what we feel about it; and we are beginning to do it.

But perhaps I am dwelling too much on the difficulties before us, and not saying enough about the great prospects for architecture as an art in this country.

In art, as in war, it is the opportunity that makes the master, and surely nowhere in the world is our profession better situated. Study and training can perhaps lay the foundations of skill in design, but it is only by actually designing and carrying out work that a man can master this art, trade, and mystery. Wren was about in middle life before he built anything. His early efforts were neither better nor worse than those of other much younger architects, but he got the opportunity and he had the head and the heart to profit by it. And Michelangelo had architecture forced on him late in life, and his earlier efforts were preposterous absurdities, but he profited by experience, lived a great age, and abandoned all the other arts of which he was a master for "the mistress art," and his masterpiece, the Dome of St. Peter's, means something.

Truly, we have the opportunity if we have but the power to avail ourselves of it.

The Conditions in Canada.

And apart from this question of actual chance of practising, we have another very great advantage in our miraculous climate. A friend of mine considers the climate, or rather climates, of Canada excellent, but complains that we have too much of them, and I believe there have been very few normal days during the last ten years.

To the climate I shall add the material available and their market forms, and to the materials I shall add the technical devices for handling them.

Here we have three sets of conditions unlike anything that our ancestors who built so well knew. Surely we can rely on these to help us out of the rut of style-mongering towards the evolution of sane design. Originality in art is not a thing worth striving after for its own sake, and when so sought is fatal to success, but inventiveness has always been the life and soul of our art, and we have got to be inventive, whether we like it or not.

It seems from the look of the plates in the British professional Press to be very difficult to be at all inventive over there. The Georgian plaster ceiling and the Elizabethan plaster ceiling seem to have come to stay. The millioned country house and the sash-windowed country house seem to be fixed quantities down to their least details, each type maintaining its respectful relation to the work of 1600 and 1750, and this is not unnatural, since the climate and materials are as they were in 1600 and 1750, and the type of window and roof thereby evolved to perfection at these dates cannot be improved upon.

But we should, in establishing our type,

derive great benefit from the fact that we have to invent our own solutions of the roof problem, and not accept our great-grand-father's; and as to the window question, there is no really satisfactory solution in sight yet that I am aware of. If we remember that it is the roof and the window that makes the architecture, we see that we have our work before us. The feature of the English architecture chimneys, parapets, bays, ranges of lights, rainheads, and all the rest of it—are absolutely inappropriate for our use. But the simple inventive spirit in which these things were evolved and welded together in vernacular use and the reserved but kindly sentiment which these evinced we can surely take to heart and apply now.

Our predecessors in this country up to about 1825 were doing pretty well in this matter. The stone houses of Quebec and Nova Scotia and the clap-board houses of New England showed real evolution of style, and in them a good many of our problems were solved at an early date. The lamentable thing is that the secret has been lost, and we have now to substitute architectural education at universities and other temporary expedients till such time as it is regained. To think that neither for love nor money could such a thoroughly sound piece of work, sound in taste and sound in construction, be put up to day in any town or village throughout this broad Dominion as can be found, once at least in five miles, on the shore all the way from Mulgrave Straits to Ottawa City, and all dated before 1840!

Tradition v. Scholarship.

Now when I say we cannot borrow a tradition ready-made from Europe or anywhere else, I must not be understood as deprecating the study of European architecture. It is for this very reason that the study of ancient architecture can do us nothing but good. The master builders of 1370 did not study any ancient architecture at all, but then they had traditions, and the same applies to the master builders of 450 B.C.

When, for a variety of causes, which it is quite beyond the scope of the present paper to analyse, the XVIIIth century tradition was lost in the XIXth-century revivals and scholarship was resorted to as a substitute, artistic achievement in design ceased altogether for the space of half a century or more. But certainly we need have no fear of scholarship as long as we do not misuse it and regard it as technology. The masterpieces of the past, if approached in the light of the theory with which we started, can show us many a useful principle in design—how to express sentiment by means of the beauty that is in stone and brick and other common things. And besides that, they can fill our hearts with the very soul and spirit of many a bygone poet in stone, when for a time we drop the inquiry of how the thing is done, and are content to apprehend the resulting meaning, for to that end were these things created.

But we allow the false hedonistic theory of art to possess us, and what can scholarship do for us? We would then approach the very Parthenon, not for its meaning, but for a sensuous satisfaction; we would conclude that this building was very successful because so many people "liked it"; and we would assume some magic virtue to "please" in the proportions of its part as such, and probably miss the spirit of the thing as a significant whole. Then, in the hope of giving as much "pleasure" as is possible in this sad world, and getting as much credit for it in fame and dollars as we could, we would proceed to put up things as like it as we could, which, I believe, is the practice of fellows of the baser sort, who, having eyes, yet do not see. Scholarship pursued in that spirit leads nowhere.

Honesty in Design.

Our responsibilities are immense. Every time we put up a meaningless ornament, a blank carouche, run a moulding round three sides of a stair well in plaster, and the fourth in cast iron, build a stone front with brick flanks, rule ashlar joints in Caen stone cement, make a false construction or emulate a superior material we prostitute the ideals of our art. All these things come so easily, naturally, and logically once we accept the theory that is in the function of the arts to please.

But when art is recognised as the most potent of modes of expression, these devices fail utterly.

It may be some time before the new philosophy of art gains general acceptance among designers. . . . It will be longer still before our lot will remain a hard one, out of sympathy with our public and our executive labour.

In the present lamentable state of ignorance or rather positive misinformation on the subject, beauty is taken to be a matter of prescription, like a peach melba or a mint julep. "Take four Ionic columns, put them in a row with the caps uppermost, flank with ashlar pilons pieced with bulls' eyes, garished with cartouches on top; over the column place an entablature, with blocking course or parapet to taste; serve as a bank. If the columns are large and ripe flute them, roof with a skylight powdered with snow, and serve as a picture-gallery. If the columns are small and meagre then pierce the pilons with windows as required and serve as bank manager's house. Note.—The other ingredients will in all cases be proportionate to the columns as explained in preliminary chapter of this cook book."

There is probably a really best way to build a bank of given size in Canada, just as there is to build a temple of given size in Greece, or a parish church in England. Then, again, a post-office, a museum, a private house should be very different from the bank, temple, or church, and from each other, not only in size and form, because the practical requirements are different, but in sentiment and expression, because the ideas associated with these things are so very different.

Yet, if all these things are in Canada, and done in one decade, they should express that, too, in a certain technical similarity. Now I think we all have a good deal to learn, because we have not established the type of our cycle very clearly, and we are still at sixes and sevens with our tradition. The French, who profess to know, say: "L'art c'est d'être toujours soi-même."

These, gentlemen, are the conditions of our competition; designs should be sent in to-morrow, and the award will be made on doomsday.

The Future.

I verily believe that the next fifty years will decide the type and character of Canadian architecture for centuries to come. Is it to become a blind, second-hand, late-in-the-day imitation of the art of luxurious cosmopolitanism which passes muster in the United States, or is it to express something distinctive and characteristic of our aspirations and institutions and the sources from which they spring.

If we have any hopes or intentions towards this latter alternative, it is high time we bestowed ourselves to that end.

The first and most essential step to take is the institution of travelling studentships, that our young men may go to Europe and see for themselves that the traditions of our civilisation are something more than the tricks of manner invented for the delectation of Louis XIV., and watered down in the practice of the U.S.A. offices, to which our best draughtsmen drift at present for wider experience.

Such scholarships should involve at least as much attention to the architecture of the United Kingdom as to that of France and Italy.

The next matter to consider is that of museums. The splendid model of the Trocadero Museum, of Paris, should find its counterpart in each of our great cities. At the Trocadero there is an historically-arranged collection of many thousands of casts and full-sized models of French architecture and sculpture, with subsidiary collections representing the typical achievements of different countries. It has been my endeavour for several years past to make such collections possible for us. The great difficulty has been the lack of initiative at South Kensington, where one can buy a cast or photograph of almost any subject of art in Europe in five minutes, and where, neither for love nor money, can you obtain a photograph of an English building or cast of an English arch mould or niche figure. I am glad to say that a beginning is being made at the Victoria Memorial Museum

at Ottawa, and that within a couple of years I hope to see there a collection of architectural ornament and sculpture in three dimensions of equal scope:—

- (a) Classic and Italian.
- (b) French.
- (c) English—at last!

Also that the museums now in course of erection at Toronto and Montreal will ere long be provided with a properly-selected set of casts and models to illustrate the evolution of British art.

Such a collection as I propose would be an educational force of immense value in any community to the designers and to the general public alike.

A third matter would be the establishment of a proper system of indentured pupilage. Our young architects learn their trade too cheap, and, like anything else that is too cheap, what they get in the deal is often not worth having. I am a strong believer in the good old system of apprenticeships in the interest of the student, the principal, and the art.

We are prone, on this continent, to expect too much of schools of architecture at universities. The result is that such schools have to do a lot of teaching which is mere technology, and are unable to find time in the curriculum for the foundations of culture so essential to our vocation as artists and as professional men.

I have endeavoured to enunciate a plain common-sense theory of art, which would guide us to use our art rather than to play with it—to express rather than to please. I have endeavoured to suggest what some of the main meaning and feelings contained in our art might be; I have enumerated the disabilities under which we labour and the advantages we enjoy; and I have ventured to suggest certain steps for the fuller realisation of those great advantages. Our art in this land has plenty of head behind it, and plenty of hand in it, but it still lacks something in matters pertaining to the heart."

LONDON COUNCILS.

Barnet.—Plans have been passed by the Urban Council for a block of offices, in Wellhouse-lane, for the Guardians of Barnet Union.

Charlton.—The building formerly occupied by the Lee District Board of Works is to be repaired at a cost of between £500. and £600. jointly by the Greenwich, Lewisham, and Woolwich Councils, who now have interests in same, and tenders are to be invited by the Greenwich Council for the work.

East Molesey.—The pathways on the south side of Beauchamp-road and the west side of Seymour-road are to be made up at an estimated total cost of £450.

Fulham.—A plan submitted by Mr. W. Harbrow for alterations to premises in Railway-place, occupied by the Ideal Composition Company, Ltd., has been passed.

Finsbury.—At the last meeting of the Urban District Council, Mr. J. A. Craig, of the Bucks Education Office, Aylesbury, was appointed architectural assistant for about twelve months in connexion with the new school proposed to be built in New North-road, at a salary of £1. 5s. per week. The following plans have been passed:—Mr. A. Marchi, motor garage, Holden-road; Mr. S. J. Hunnings, twelve houses, Windermere-avenue; Mr. A. J. Harris, five houses, Lankaster-gardens. The following plans were lodged:—Mr. W. Penchev, four houses, Etchingham Park-road; Mr. G. F. Taylor, building line, Regent's Park-road; Mrs. Garcia, motor garage, Kingswood, Dollis-avenue.

LAW REPORT.

Howlett v. Harrods, Ltd.

THIS case, which came before the Vacation Judge, Mr. Justice Lush, on Wednesday, arose out of certain structural alterations on premises of the defendant adjoining the flat of the plaintiff, and which the latter complained constituted an annoyance to him, and obtained an injunction restraining the defendants from continuing the nuisance.

His Lordship remarked that this was the case where the workmen worked all night.

Mr. Bramwell Davis, K.C. (for the applicant), agreed, and said there was now an affidavit from the managing-director of Harrods, saying, he did not intend to work any more at night. Therefore, he asked his

learned friend on the other side to undertake that that effect.

The Court had already granted an injunction against any work being undertaken between the hours of 10 p.m. and 6 a.m. this had not been obeyed.

Mr. Hunt, for Harrods, said that some difficulty in giving such an undertaking as asked. Some of the complaints of the taking into the building of iron weighing between ten and twelve tons a night. Unfortunately, this had to be under the London County Council regulations and could not be helped. One other complaint concerned the working of plasterers at night; but that could constitute an annoyance.

His Lordship: Why cannot you undertake that it will not be carried out? Mr. Hunt said the difficulty was that the injunction, if they gave such an undertaking, it might lead to difficulties, night work had been going on, and causing any annoyance at all.

His Lordship said he had carefully considered the London County Council regulations, the injunction to any form of annoyance, the occupant of the flat. In large buildings was very difficult to know how much was made.

Mr. Hunt pointed out that Harrods had a large number of flats, whose tenants were clients of theirs, and they desired to have the best of terms with them. There had been isolated occurrences, which, he did not justify an injunction. He asked for the application to stand over defendants, at the same time, saying they would take all reasonable steps to prevent any annoyance.

His Lordship: Mr. Davis, cannot arrange this matter?

Mr. Davis said this was not the first time the thing had occurred. In April, 1909, the plaintiff's wife, Mrs. Howlett, wrote defendants, and an undertaking was not kept, and now plaintiff placed reliance on the defendant's undertaking.

His Lordship thought the only thing an injunction. He had no doubt that Harrods had the best of intentions in making no noise at all, but the contractors make noises, and an injunction would take that.

Mr. Hunt: There may be an actual noise, my lord?

His Lordship: But surely that would be treated as a nuisance?

Mr. Davis: No, of course not, plaintiff (added Counsel) had been molested but the noises went on during his absence from his flat, and the poor unhappy lady was disturbed.

His Lordship said what the defendant was to let a flat to a gentleman, and to make such a noise that he could not live in it, and then they gave a promise to continue it.

Mr. Hunt said he could not give an undertaking, as the consequences were so serious. He asked for the motion to stand over, liberty to restore.

His Lordship thought it very regrettable that the parties could not come to an arrangement. He would allow the matter to stand over, but would continue the injunction.

PATENTS.

APPLICATIONS PUBLISHED.*

19,346 of 1910.—Domenico Accetola: Manufacture of artificial marble and the like.

19,401 of 1910.—David Barclay: Method of hinging casements.

25,011 of 1910. Theodor Vogt: Process of apparatus for making cement stone slabs.

25,286 of 1910.—Walter Sommer: Drums and rollers.

25,322 of 1910.—Joseph Crook: Means of connecting closet-seats and covers to the portion of the seat.

25,947 of 1910.—Adolf Vietor: Gripping devices such as pipe wrenches, lathe carriers, the like.

596 of 1911.—Marcel Lamort: Machine for cutting and perforating sheet metal.

2,865 of 1911.—Fernand Paul Raoul Latil: Kilns for bricks and the like.

7,963 of 1911.—John Bird-Howard: Window frames and sashes.

9,628 of 1911.—William Edward Lake (Electric Machine Company): Machine for routing and other wood-working operations.

9,628 of 1911.—William Edward Lake (Electric Machine Company): Guide device for routing and like wood-working machines.

* All these applications are in the stage which opposition to the grant of Patents them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointment, xvii.; Auction Sales, xxi.

ertain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

he date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

SEPTEMBER 19-25.—**Athens.**—**COURT OF JUSTICE.**—International competition is instituted by Ministry of the Interior, for the erection of buildings, to cost 160,000l. The Official may be seen at the Library of the A.

SEPTEMBER 15.—**Lowestoft.**—**SCHOOL.**—The Local Education Committee invite designs for elementary school for 600 boys at Roman-Three premiums are offered: 20, 10, and 5l. See advertisement in issue of June 16 other particulars.

SEPTEMBER 16.—**Manchester.**—**LIBRARY AND GALLERIES.**—Limited to the ten selected titors in the first competition. See issue of 23, p. 780.

SEPTEMBER 4.—**Eastington R.D.C.**—100 model for Merton Colliery, Durham. 2l per net cost to successful architect.

SEPTEMBER 7.—**Barnsley.**—**EXTENSION OF**—The Barnsley T.C. invite drawings for further extension of Public Baths. Three premiums are offered—50l., 30l., 20l. See advertisement in issue of August 11 for further particulars.

SEPTEMBER 7.—**Evesham U.D.C.**—Designs for out site and erecting thereon thirty es. Particulars from the Clerk to the U.D.C.

SEPTEMBER 12.—**Coseley.**—Plans are invited for a to accommodate about 200 children. Particulars from the Education Officer, Coseley, near B.

SEPTEMBER 14.—**Bristol.**—**ALTERATIONS IN THE HOTEL.**—Particulars from Mr. F. A. 14, Corn-street, Bristol.

SEPTEMBER 23.—**Salford.**—Extension of office medation on workhouse site at Eccles New. Premiums 20l. and 10l. Particulars from the Board of Guardians, Salford. Limited to acts practising in Salford and district only.

SEPTEMBER 30.—**Holland.**—**STAINED GLASS WIN-**—Designs are invited for a stained glass w to be erected in the University at n. See advertisement in issue of June 9 other particulars.

SEPTEMBER 31.—**Marlybone.**—**NEW MUNICIPAL**—Premiums of 100l., 50l., and 25l. Particulars in Mr. Henry T. Hare, F.R.I.B.A. See advertisement in issue of July 14 for further particulars.

SEPTEMBER 1.—**City of St. Petersburg.**—**CONTRACT TO ALEXANDER II.**—Particulars in our of August 13, 1910.

SEPTEMBER 30.—**Cardiff.**—**TECHNICAL INSTITUTE.**—Cardiff Education Committee invite designs and estimates for a technical institute. Advertisement in issue of August 18 for other particulars. Successful architect to carry out. Premiums of 125l., 75l., and 50l. to competitors. Mr. J. S. Gibson, assessor.

SEPTEMBER 30.—**Hastings.**—**EAST SUSSEX**—The Joint Committee of the East Hospital and King Edward VII. Local Funds invite designs for new hospital. Advertisement in issue of August 25 for other particulars. Premiums of 125l., 75l., and 50l. Mr. E. T. Hall, assessor.

SEPTEMBER 29.—**Glasgow.**—**DESIGN FOR A**—Designs are invited (Alexander Thom- travelling Studentship) for a bridge. Pre- Particulars from Messrs. Burke & Jack- 20, 37d. Conditions on application to chief Burgomaster Dusseldorf.

SEPTEMBER 29, 1912.—**Montevideo.**—**GOVERNMENT** (premiums 2,355, and 650l.) and town im- nent scheme (premiums 1,060l., 640l., and 200l.) Conditions on application to the Board of 73, Basinghall-street, E.C.

SEPTEMBER 31, 1912.—**Australia.**—**DESIGNS FOR A**—Capital City. The Government of the onwealth of Australia invite competitive s for the laying out of this Federal capital. See advertisement in issue of September 1 other particulars.

SEPTEMBER 1, 1912.—**Dusseldorf.**—A plan for the on of Dusseldorf. Premiums 100l. to 37d. Conditions on application to chief Burgomaster Dusseldorf.

DATE.—**Nottingham.**—**BAPTIST CHURCH**—Remises—Limited to Nottingham archi- Particulars from Messrs. Burke & Jack- 20, 37d. Conditions on application to chief Burgomaster Dusseldorf.

DATE.—**Rochdale Infirmary.**—**EXTENSIONS**—sor. Mr. Alex. Graham, F.R.I.B.A.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

SEPTEMBER 18.—**Blarncaldach.**—**SCHOOL.**—Erection of school and teacher's house. Plans seen, and quantities from Mr. J. G. Falconer, architect, Fort William.

SEPTEMBER 16.—**Landrindod Wells.**—**SHOPS,** etc. Erection of a block of shops and two houses. Plans and specification from Mr. W. Scott-Deakin, F.R.I.B.A., architect, Shrewbury.

SEPTEMBER 16.—**Waberthwaite.**—**VILLA.**—Erection of a villa. Mr. W. T. Noon, Waberthwaite, Cumberland.

SEPTEMBER 18.—**Conway.**—**RESIDENCE.**—Erection of a residence. Messrs. Richard Davies & Son, L.R.I.B.A., architects, Bangor.

SEPTEMBER 18.—**Dundalk.**—**OFFICES.**—Erection of offices in Barrack-street. Plans and specifications from Mr. J. F. McGahon, architect, Exchange-buildings.

SEPTEMBER 15.—**London.**—**ENCLOSURE.**—Erection of a cinematograph enclosure at Goulston-street Baths, Stepney. Borough Engineer, Mr. M. W. Jameson, A.M.Inst.C.E., Municipal Offices, 15, Great Aisle-street, Whitechapel, E. Deposit of 1l.

SEPTEMBER 18.—**Rhynlleid.**—**ALTERATIONS.**—Additions and alterations at Rhynlleid Public School. Plans and specifications with Messrs. Brown & Watt, F.R.I.B.A., 17, Union-terrace, Aberdeen.

SEPTEMBER 18.—**Sheringham.**—**DOCK.**—Erection and completion of proposed dock, etc. Beeston Approach. Quantities from Mr. F. Hall Smith, Surveyor to the Council, Sheringham.

SEPTEMBER 18.—**Wakefield.**—**PLANT-HOUSE.**—Erection of a plant-house at the park. Plan and specification seen, and quantities from Mr. J. P. Wakeford, A.M.Inst.C.E., City Surveyor, Town Hall, Wakefield.

SEPTEMBER 19.—**Skelmankirk.**—**SHED.**—Erection of a weaving shed at Tenter Croft mills. Plans seen, and quantities from Mr. J. Berry, architect, 3, Market-place, Huddersfield.

SEPTEMBER 20.—**Aberdare.**—**HOUSES.**—Erection of seventeen dwelling-houses. Goddardman & the Fitzhugh Building Club. Plans and specification with Mr. C. H. Ellford, architect, 32, Canon-street, Aberdare.

SEPTEMBER 20.—**Cardiff.**—**SHED.**—Extension of the existing wagon shed at the cleansing depot. Drawings and specification seen, and form of tender from the City Engineer, City Hall, Cardiff.

SEPTEMBER 20.—**Kinsale.**—**COTTAGES.**—Erection of forty-six cottages. Mr. J. Murphy, Clerk, Council Office, Kinsale.

SEPTEMBER 21.—**Darlington.**—**ADDITIONS.**—Erection of additions to the Corporation-road School. Plans and specification seen, and quantities, on deposit of 2l. 2s., from Mr. George Winter, Borough Surveyor, Town Hall.

SEPTEMBER 21.—**London.**—**HOUSE.** etc.—Enlargement of Chief Engineer's house and erection of lavatories on the Bancroft-road premises, Mile End, E. Specification from Mr. T. Rowland, Acting Clerk to the Guardians, Guardians' Offices, Bancroft-road, Mile End, E.

SEPTEMBER 22.—**Bempton.**—**SCHOOL.**—Erection of a Council school. Plans seen, and quantities, on deposit of 1l. 1s. from the Building Surveyor, County Hall, Beverley.

* SEPTEMBER 22.—**Watton.**—**NEW INFIRMARY.**—The Guardians of the Waynfleet Union, Norfolk, invite tenders for new infirmary buildings. See advertisement in this issue for further particulars.

SEPTEMBER 23.—**Mansfield.**—**SCHOOLS.**—For alteration of the chapel and schools. Drawings and specifications with the Surveyor, Mr. E. F. Cook, A.M.Inst.C.E. Leamington-street, Mansfield.

SEPTEMBER 23.—**Morpeth.**—**ADDITIONS.**—Alterations and additions to premises, Bridge-street. Drawings and specifications seen, and quantities, on deposit of 1l. 1s., from the architect, Mr. C. Franklin Murphy, Newgate-street, Morpeth.

* SEPTEMBER 23.—**South Chingford.**—**SCHOOL.**—The Essex Education Committee (Essex District Sub-Committee) invite tenders for public elementary school in the New-road, South Chingford. See advertisement in this issue for further particulars.

SEPTEMBER 25.—**Bristol.**—**TRANSIT SHED.**—Con- struction of a single-floor transit shed on the west wall of the Royal Edward Dock, Avon- mouth. Deposit of 5l. to Mr. W. W. Squire, Engineer, Engineer's Office, Cumberland-road, Bristol.

SEPTEMBER 25.—**Chesterfield.**—**COTTAGES, ETC.**—Erection of two cottages and appurtenant build- ings at the junction of Rothwale-road with Stortforth-road, South Ward. Plans, specifica- tion, and form of tender, on deposit of 2l. 2s., from the Borough Surveyor, Salter Gate.

SEPTEMBER 25.—**Elworth.**—**CHAPEL, ETC.**—Erection of chapel and school. Plans and specifica- tions with Messrs. A. Price & Son, architects, Sandbach.

SEPTEMBER 26.—**London.**—**REPAIRS.**—The Council of the Metropolitan Borough of Green- wich invite tenders for external repairs to the baths and washhouses, London-street. Specifi- cations seen, and forms of tender from Borough Engineer, Town Hall, Greenwich.

SEPTEMBER 26.—**Aspatia.**—**HOUSES.**—Erection of two dwelling-houses. Plans and specifications with Mr. J. Henney, architect and surveyor, 39, Senhouse-street, Martport.

SEPTEMBER 26.—**Epsom.**—**WARD.**—Erection of an operation ward at Workhouse Infirmary. Drawings, specification, and form of tender, on deposit of 10s., from the Architect, Mr. A. C. Williams, 53, Doughty-street, W.C.

* SEPTEMBER 27.—**Ash-next-Sandwich.**—**PARISH HALL.**—Tenders are invited for new parish hall, etc. See advertisement in this issue for further particulars.

* SEPTEMBER 27.—**London.**—**S.W.**—**REPAIRS.**—The Metropolitan Asylums Board invite tenders for repairs to roof and gutters at Fountain Hospital, Tooting, S.W. See advertisement in this issue for further particulars.

* SEPTEMBER 27.—**London.**—**W.**—**EXTENSION OF DINING-HALL.**—The Guardians of Paddington in- vite tenders for extension of dining-hall at Work- house, No. 5 Woodfield-road, Harrow-road. See advertisement in this issue for further particulars.

SEPTEMBER 27.—**Sevenoaks.**—**ADDITIONS.**—Alterations and additions to the Children's Homes, Chipstead Common. Plans and specifi- cations seen, and quantities from the architect, Mr. Ernest Pawley, 86, High-street, Sevenoaks, on deposit of 1l. 1s.

SEPTEMBER 28.—**Widnes.**—**HALL.**—Erection of a new drill-hall. Plans and specifications with the architect, Mr. J. P. Fraser, 14, Elliot- street, Liverpool.

* SEPTEMBER 29.—**Birkenhead.**—**SORTING OFFICE.**—The Commissioners of H.M. Office of Works and Public Buildings invite tenders for new sorting office (Birkenhead). See advertisement in this issue for further particulars.

* SEPTEMBER 29.—**Southampton.**—**IRON**—**COOKERY-ROOM.**—The Southampton C.C. invite tenders for a corrugated-iron cookery-room at Broughton Council School. See advertisement in this issue for further particulars.

OCTOBER 2.—**Chertsey.**—**HOME.**—Erection of a home for children. Deposit of 1l. to Mr. H. E. Paine, Clerk, 30, Guildford-street, Chertsey.

OCTOBER 2.—**Glanton.**—**ALTERATIONS.**—Alter- ations and improvements to church and manse. Plans and specifications with Mr. G. Reavell, Sur., A.R.I.B.A., Alwicks.

* OCTOBER 2.—**Ottershaw.**—**HOME FOR CHILDREN.**—The Guardians of Chertsey invite tenders for a home for children. See advertise- ment in this issue for further particulars.

* OCTOBER 3.—**Birmingham.**—**TELEGRAPH STORES.**—The Commissioners of H.M. Works and Public Buildings invite tenders for the finishings (second) contract at block C, Bir- mingham Telegraph Stores. See advertisement in this issue for further particulars.

* OCTOBER 3.—**London.**—**EXTENSION OF LAND**—**REGISTRY.**—The Commissioners of H.M. Works and Public Buildings invite tenders for exten- sion of the Land Registry. See advertisement in this issue for further particulars.

OCTOBER 7.—**Halifax.**—**SHELTERS.**—Erection of tramway shelters. Particulars from Borough Engineer, Town Hall, Halifax.

No DATE.—**Aberdeen.**—**THEATRE.**—Erection of an electric theatre, 476, Union-street, Aberdeen. Apply to the British Cinematograph Theatre, Ltd., 199, Piccadilly, London, W.

No DATE.—**Bewdley.**—**ALTERATIONS, ETC.**—For additions and alterations to Leam-lane school. Quantities, on deposit of 2l. 2s., from Messrs. Pritchard & Pritchard, architects, Bank-build- ings, Kidderminster.

No DATE.—**Crossgates.**—**VILLAS.**—Erection of two semi-detached villas. Mr. Eric V. Wim- penny, architect, West Bar-chambers, 38, Bar- lane, Leeds.

No DATE.—**Cushendall.**—**CHURCH.**—Extension and improvements to R.C. church. Plans, specifi- cations, and particulars from Messrs. Moore & Fleming, architects, 35, Royal-avenue, Belfast.

BUILDING—Continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

No DATE.—**Cushendall**.—HOTEL. For rebuilding hotel. Plans and specification from the architects, Messrs. Connolly & M'Avoy, M.R.I.A.I., Oxford House, 35, Oxford street, Belfast.

No DATE.—**Dublin**.—WORKS.—For building a new printing works at Boyce-street. Quantities from Messrs. Morris & Co., surveyors, 48, Harcourt-street, Dublin. Messrs. Doolin & Butler, architects, Dawson-chambers, Dublin.

No DATE.—**Duygysylchi**.—COTTAGE.—Erection of a cottage. Messrs. Richard Davies & Son, L.R.I.B.A., architects, Bangor.

No DATE.—**Ilkley**.—RESIDENCE.—Erection of a residence. Messrs. Empsall & Clarkson, architects and surveyors, 7, Exchange, Bradford.

No DATE.—**Langammarch Wells**.—ADDITIONS.—Alterations and additions to Afan Lodge, comprising new dining and billiard rooms, etc., and about twenty bedrooms. Plans, specification, and particulars from Messrs. Alfred Swash & Son, F.R.I.B.A., architects, Llandrindod Wells.

ENGINEERING, IRON, AND STEEL.

SEPTEMBER 18.—**Radcliffe**.—PLANT.—Erection of a water-softening and purifying plant at electricity works. Specifications with the Electrical Engineer, Electricity Works.

From Mr. W. H. Ward's "The Architecture of the Renaissance in France." (B. T. Batsford.)

THE RENAISSANCE IN FRANCE.*

PROBABLY no phase of the Renaissance was so complex and subjected to so many conflicting influences as that which developed in France. In the domination of the Classicism quite overshadowed the relatively Gothic tradition. In Germany the buildings of this age retained the vernacular, and are less indebted to ideas imported from elsewhere. In Spain and Portugal alone show the influence of forces that failed to penetrate France. As for our own country, all our Renaissance architecture is its characteristics to one or other of the intermediate countries, and, while the routes by which it reached us

can be traced, it cannot be contended that it shows the same quality of conflict and gradual assimilation of varying ideals in the subtle and intricate manner to be found in contemporary architecture in France.

France, with its high technical achievement in mediæval buildings, offers an example of the effect of a sudden importation of utterly dissimilar conceptions of architecture on a skilful and well-trained body of artisans; and the way in which this inflowing wave gradually overcomes the national tradition in some directions, while it expends itself in vain in others, affords the material for many interesting studies.

The difficulties in the path of one setting himself the task of dealing adequately with the subject can only

be realised on reading such a work as that from the pen of Mr. W. H. Ward which has just been published. As our readers are probably aware, it would be difficult to find an author better qualified to deal with this architectural development. Mr. Ward's "French Châteaux" and other historical researches must have formed useful preliminary studies for this more comprehensive work. In a subject having so broad a platform it is a difficult task to determine a scheme of arrangement. Geographical, chronological, biographical, and other methods all have their claims to recognition, and the adoption of any one of these to the exclusion of the others at once makes any adequate treatment impossible.

Mr. Ward has, we think, displayed very

*The Architecture of the Renaissance in France, 1580." By W. H. Ward, M.A., A.R.I.B.A. Two large octavo. London: B. T. Batsford, 1911.

The Châtelet, Chantilly. By Jean Bullant.

sound judgment in the system he has adopted in the arrangement of his work. Without some such system, indeed, a work covering such a wide field would have failed to achieve its purpose of giving a clear and proportionate impression of French architecture during the important period extending over the XVIth, XVIIth, and XVIIIth centuries.

As, must, obviously be the case in a work of history, the most important divisions are made chronologically. The eight chapters that make up the two volumes each deal with a style having definite characteristics of its own. Minor subdivisions are made, but substantially the eight styles fall within the following periods, and the usual nomenclature, viz., that of the monarch at the time, is adopted:—

- 1st—1495-1515—Louis XII.
- 2nd—1515-1545—Francis I.
- 3rd—1530-1590—Henry II.
- 4th—1590-1660—Henry IV. & Louis XIII.
- 5th—1640-1710—Louis XIV.
- 6th—1710-1770—Louis XV.
- 7th—1730-1790—Louis XVI.
- 8th—1790-1830—Empire.

Each chapter opens with a brief but telling sketch of the general history of the period. Then we find descriptive notes on the architectural characteristics of the work of the time, and following this the most important buildings are

described. They are grouped under two headings—"Secular" and "Church." In each case the principal buildings are first described and those of less importance dealt with together, having regard to their geographical distribution.

Château de Rougemont.

When, later on, the recognition of the individual architect becomes general, the attribution of buildings to their authors forms the basis of arrangement, and the biographical method comes more into use. We find most admirable the method by which, while a general con-

sistency of treatment runs through whole work, the author avoids a slavish adherence to mechanical routine, and adapts his method of exposition to circumstances of the period.

If we have appeared to dwell at unlength on the structural form of Ward's work our excuse must be that we rarely find books of this character which combine so happily the systematic arrangement of the text-book with flexibility of method that alone suggest sympathetically the spirit of each successive development.

These two volumes, handy in the size, containing over 500 pages with 465 illustrations, cover the wide area of their subject in a way that would hardly have been expected from their small bulk. This compression has been effected by a most careful study of proportionate interest both in the text and in the scale of the illustrations, and the result reflects the greatest credit on the author. Only a most thorough and comprehensive knowledge would have enabled him to deal with his subject in such a concise and at the same time interesting fashion.

The Introduction opens with a review of the conditions in France immediately prior to the Renaissance, and goes on to indicate in outline the earlier influence, opening the way to its advent from Italy. Following the fluctuations of its varying fortunes, we see from time to time fresh developments either evolved from within or due to external influences from one direction or another. Dealing with the revival of the pure Classic school in the XVIIth century, Mr. Ward aptly likens this admixture of motives to the stock and the graft:—

"The native element supplies the sap, the life, without which the graft must perish. But it is by virtue of the graft, an importation from outside, yet remotely of its own kin, that the tree is saved from running to waste and enabled to bear a crop of fragrant blossom and mellow fruit. Though the detail and typical features of the native element soon disappeared, yet the principle which underlay them remained. It survived in many characteristic arrangements, in the insistence on verticality, in endeavours to express actual construction and plan in the architectural treatment, and in the consequent soaring and picturesque effects. The imported element brought with it the love of the horizontal line, the idealism which does not scruple to imitate or retain, for their intrinsic beauty, forms once originated by structural needs, but afterwards elaborated into objects of admiration for their own sake."

Hôtel de Salm: River Front.

Chapter I. we see the results of the invasions of Italy under Louis VIII. and Louis XII., the importation of Italian craftsmen and taste, and the influence of this school on the French artisan. The Lombard character of this earlier work is contrasted with the stronger influence of the school to which reference is made in Chapter II., where we come to Francis I. and his imported Italians at work on the chateau de Chambord. During this reign the position of the director of works as architect became more clearly defined, the influence of such men as Il Rosso, Primaticcio, and Primaticcio in forming the style of Henry II. is traced in the comment of Chapter III. Further on we read of the almost contemporaneous work of the distinguished French architects, Jean Goujon, Philibert de l'Orme, Jacques Androuet du Cerceau, Pierre de la Fontaine, and Jean Bullant. Mr. Ward points out that, while these men shared the Italian versatility that enabled them to practise two or more styles, they differed from them in that they broke less completely with Gothic tradition and had less mastery of the principles of Classic design, while their grasp of construction made it of greater importance as influencing their designs.

During this period the individuality of the artist was more marked than during subsequent reigns, when, after a period of anarchy, the restoration of a strong government brought in its train a demand for uniformity that crushed the individualistic spirit. Thus we reach Chapter IV. the times of Henry IV. and Louis XIII. The work under these reigns displays less imagination than the earlier phases of the French Renaissance, and in the author's words: "Economy, sobriety, and reason are admirable as steadying forces, but they are insufficient as an inspiration," constantly artists still turned to Rome for models on which to base their designs. The characteristics of the work of these reigns are summed up as follows:—

"The average buildings of the age of Henry IV. and Louis XIII. rarely possess the qualities of distinction and grace, they have a certain charm from that air of repose, of tranquillity, and substantial comfort which they share with the domestic architecture of England and Holland of a little later date, while in the work of the greater masters the style is capable of considerable grandeur. Its system of decoration is undeniably grotesque and lacking in refinement, but equally undeniably it has the decorative qualities of a vigorous and original character."

Chapter V., in dealing with the long reign of Louis XIV., divides it into three periods—the first marked by the growth of the classical spirit, and an increase of refinement and concentration, resulting in the formation of a new style; the second in which this matured style reaches its most brilliant expression; and the third, which is characterised by a change not in the quality of architecture, but in the unity of its aim. The unclassical, naturalistic tendencies, formerly repressed, once more raise their heads.

The work of Perrault at the Louvre (illustration on page 319) displays a tendency towards dignified severity,

while under J. H. Mansart and his pupils architecture passed on from this phase towards variety and gaiety, qualities that had previously begun to show themselves in decoration even while the architectural lines remained severe.

In Chapter VI. we are brought to the amazing development of decorative ornament identified with the reign of Louis XV. Even the reaction from the severity of the official architecture of Louis XIV. hardly seems sufficient to account for the remarkable quality in the types of design denominated "Régence," "Rocaille," and Rococo. We have always felt the difficulty of realising the genesis of this rapid break away from tradition—more especially in view of the originality it displays in the treatment of form. Beyond making it clear that it seems to have taken contemporary artists almost as much by surprise, and exercised the wits of the Academy as to how far it should be recognised, Mr. Ward does not quite clear up the question. He is careful, however, to point out the foreign influences, and takes note of the fact that in France structural architecture was far less affected than in the rest of Europe.

The fall of this style is almost as dramatic as its rise; but for a few

lingering examples of later years, the change took place in 1750, and, as may be realised from Chapter VII. of our book, the style of Louis XVI. took up the traditions of that of Louis XIV., almost completely skipping over those immediately preceding it. Thus some fifty years covers the whole life of one of the most remarkable expositions of decorative art the world has ever seen.

Mr. Ward accepts the usual claim of the reign of Louis XVI. to give its name to a style, but qualifies this by the admission that the style so named was, in a large measure, the creation of the two architects—Jean Nicholas Servandoni (1695-1766) and Jacques Germain Soufflot (1714-80), both citizens of Lyons, a city always in close contact with Italian thought.

The last chapter on the style of the Empire dismisses it somewhat briefly, but it may be that, despite some fine works belonging to this period, one cannot pursue the study of so vital a development as the Renaissance in France without feeling that it dies out in a dry scholasticism, and that its latter days fail to excite the interest evoked by those ages when knowledge counted for less and imagination for more.

Paris: Fontaine de Grenelle. By E. Bouchardon (1739).

BUREAUCRACY VERSUS COMPETITION.

THE Aberdeen Education Committee, with a view to obtaining the best design for their new buildings, proposed to hold a limited competition between eight architects, but, having already had plans prepared showing the accommodation required, they, on submitting their proposal to the Scottish Education Department, received the following reply:—

“Scotch Education Department,
September 2, 1911.

Sir,—Adverting to your letter of the 23rd ultimo, I am directed to state that if, as the Department understand from previous correspondence, your Committee have already in their possession plans which are of such a character as to make it certain that their author would do the whole work adequately and satisfactorily in the event of its being entrusted to him, then the Department could not sanction the contemplated competition. It appears to them that it would be altogether unjustifiable, particularly in the present state of the Education (Scotland) Fund, to approve the expenditure of more than 1,000*l.* of public money on purposes that were not strictly necessary. They cannot think that such a course would be followed in the conduct of any private business concern.—I am, etc.,

G. W. ALEXANDER.”

It is perhaps more to be deplored than wondered at if a public body discourages the advantages to be gained by obtaining competitive designs. To put the matter in the lowest basis of mere economy, it is easy to conceive that the 1,000*l.* referred to might be more than saved by

improvements in arrangement that the best of eight designs would be expected to show, so that the idea of extravagance is short-sighted and fallacious.

We are, however, in official work, gradually coming more and more under the domination of bureaucratic methods that make for stereotyped design, and must necessarily discourage all proposals tending to promote experiment and innovations, without which, what hope is there of improvement and progress?

Human nature being what it is, how can the permanent official have the same incentive to modify and to improve which open competition among unfettered minds automatically gives? and the whole tendency of our governing bodies seems to be towards substituting the work of the permanent official for the independent practitioner. We hold no brief against the qualified official; he has much important work to do, and may do it exceedingly well, but we would take the opportunity of protesting against the growing tendency to throw all the work involving design and invention into his hands, as tending to stifle progress and lose to the public the advantages of unfettered minds working on problems ever developing.

The policy of government includes not only the immediate needs of the community as a whole, but their future advancement, and this entails provision being made for the encouragement of the more active and intelligent and for setting them in a path that shall keep

this activity and intelligence at its tension. Now, the system of increasing the number of officials has an effect—reverse of this, while that of open competition for work, whenever possible, fosters it. Therefore the right policy those controlling public interests should be to limit their official staff to the actual strength demanded by the routine work and place as much of their work as possible in the open market, in order that they may be in a position to take advantage of every new idea and encourage those on whose ability the future depends.

We have referred to this question before, and shall probably have occasion to revert to it again, as the direction which we are travelling appears likely to lead to national disaster. For us, as a nation are already ultra-conservative in regard to ideas, to accentuate this by discouraging initiative is likely to prove fatal to our future welfare, and the course is exactly the one now being taken by our public authorities.

NOTES.

The City Corporation at Vienna.

ALL those who cherish the imperishable memory of the lavish and graceful hospitality extended by the Court and City of Vienna to the International Congress of Architects, will realise that the Lord Mayor and Corporation of London are indeed fortunate in being the recipients of so warmly hearted a welcome from one of the most charming of European capitals. Apart from the value of such visits as promoting the cause of international goodwill and the general progress of humanity, they have a special value for the somewhat insular Englishman, and to no class of the community are their educational advantages more valuable than to those who undertake the responsibility for the government of our great cities, and for the control of their amenities—our civil authorities are not unconscious of this responsibility. They undertake it with a conscientious regard for honest government and the material interests of the city. But there is such a thing as an artistic conscience as well as a moral one, a sense of right and wrong in dealing with artistic questions as well as with commercial ones. It is this sense that is lacking here, and we know no better way of acquiring it than by sympathetic intercourse with the inhabitants of the great cities of other nations where the artistic conscience is a national possession. Would that this visit had taken place before the scheme for St. Paul's Bridge was finally settled. Possibly it might have led to a stirring of conscience. However, it is not too late yet; there is always time for repentance even at the eleventh hour. The bridge is not yet built.

State Aid for Housing Schemes.

MR. ARTHUR GRIFFITH BOSCAWEN, writing in the *Times* of September 12, advocates that the State should provide half the net cost of clearing insanitary areas in our cities, and justifies his contention by the claim that improvements of this character have just

Theatre at Amiens. By J. Rousseau (1778-1780).

From Mr. W. H. Ward's "The Architecture of the Renaissance in France." (B. T. Batsford.)

great a claim on the State as others which the national funds are already distributing. As a matter of principle it can hardly see the justification for a claim. A State contribution ought to be sought in cases affecting the community as a whole, and the detrimental influence of the slum is as infinitely local in character as almost anything one could name. It appears manifestly unfair to tax a community that might have, through far-sighted and careful local government, checked the development of slum areas for the advantage of one that had proved itself neglectful and slack. It is all very well to regard the State as a milch cow of limited capacity, but such an attitude is to weaken the sense of local responsibility and to produce a condition of affairs that would result in a careless regard of ways and means. In shifting the burden laid on our great cities for the improvement of the conditions of life in them, on whom would it fall? Either other cities which have their own problems to cope with, and, as we have it, should not be penalised if they have it with them more effectually, or else rural areas which are poorer and could afford to contribute to the cost of civic improvements.

At the moment when we were congratulating ourselves on the fact that, through the public-spirited action of Sir Francis Trippel, Tattershall Castle and mantelpieces were saved to the nation, comes the disconcerting intelligence that at least of these mantelpieces have been so badly damaged by removal that the possibility of their restoration is in doubt. It might have been thought that the responsibility for this destruction should at least have had the common sense to satisfy themselves that removal was practicable, and, if so, to ensure that

it should be done in such a manner as to enable the product of their misguided efforts to be of a character suitable for reconstruction, otherwise of what value were their labours? According to Canon Rawnsley, even these precautions seem to have been neglected, and it appears as if the loss is irreparable. The expert who has investigated the condition of the fragments declares that even if restored the mantelpieces can never be what they were. The National Trust has decided not to proceed further in the matter, and it seems certain that Tattershall Castle will be denuded finally of its attributes, in a way which is nothing short of scandalous. It is clearly the duty of the nation immediately to take such steps as will render impossible the repetition of vandalism of this kind. Mr. Leonard Stokes, in a letter to the *Times*, promises that the R.I.B.A. will support any movement for the protection of such buildings from injury.

LOVERS of our country scenery will welcome the step taken by the Hampshire County Council under the Regulation of Advertisements Act, 1907, as recently announced by Mr. Richardson Evans, the Chairman of the "Scapa" Society, an association which secured the passing of the above Act, and which has done valuable service in protecting scenery. The provisions of the Act enable local authorities to make by-laws for "regulating, restricting, or preventing the exhibition of advertisements in such places and in such manner or by such means as to affect injuriously the amenities of a public park or pleasure promenade, or to disfigure the natural beauties of a landscape." There has been great difficulty in giving practical effect to the latter words of the sub-section because the Home Office held that to make a by-law operative specific places or spots must

be indicated. With such a limitation it has appeared impossible to protect in general terms the amenities of our roadsides. The Hampshire County Council have now drawn up the following by-law, and have undertaken to defend its validity in the courts if it be called in question:—"No advertisements shall be exhibited on any hoarding, stand, or other erection visible from any public highway (whether carriageway, highway, or footway), and so placed as to disfigure the natural beauty of the landscape." It may be well to explain that the above by-law will in no way affect notices necessary for the business purposes of those actually occupying land or buildings. Common sense will support the above by-law, and it is to be hoped that no legal flaw will be discovered in its terms.

Taxation of Posters No Deterrent.

WHILST advertising to this subject we may observe that it has been often suggested that a tax might well be imposed on poster advertisements. In France some considerable revenue is derived from this source, but, far from appearing to check this form of advertising, we find the scenery in France more disfigured than our own by this barbarous method of advertising, and in such "beauty spots" as the Riviera the local authorities are much exercised by the question of checking the abuse. The taxing of such advertisements only appears to give official sanction to their use.

THE STORY OF THE BRIDGE.

By WALTER SHAW SPARROW.

VII.—HINTS ON THE STUDY OF BRIDGE DECORATION.

M. CHARLES BÉRANGER, of the *Librairie Polytechnique*, Paris, has begun to publish a series of full and thorough books on bridge-building, as useful to us as to French

High Level Bridge at Newcastle: Early Victorian.

[Photo. by Frith.]

The Pont Neuf, Paris.

[Photo. by Frith.]

students. Already eight volumes have been issued. They include:

1. "Ponts en Maçonnerie." Par E. Degrand, Inspecteur-Général des Ponts et Chaussées, et Jean Résal, Ingénieur des Ponts et Chaussées. Two volumes, illustrated; 40 francs.

2. "Ponts Métalliques." Par M. Pascal, Ingénieur. One volume; 15 francs. Illustrated.

3. "Croquis de Ponts Métalliques." Par Jules Gaudard, Ingénieur Civil et Professeur Honoraire de L'Université de Lausanne. Profusely illustrated; 20 francs.

4. "Cours de Ponts Métalliques." Par Jean Résal. Tome i. 375 illustrations; 20 francs.

5. "Manuel Théorique et Pratique du Constructeur en Ciment Armé." Par MM. N. de Tédesco et V. Forestier. One volume, 242 illustrations; 20 francs.

6. "Etudes sur Les Ponts en Pierre Remarquables par Leur Décoration." Par F. De Dartin, Inspecteur-Général des Ponts et Chaussées en Retraite, etc. Vol. i., Ponts Français antérieurs au xix. siècle; not yet published. Vol. ii., Ponts Français du xviii. siècle; Centre; published. Vol. iii., Ponts Français du xviii. siècle; Languedoc; published. Vol. iv., Ponts Français du xviii. siècle; Bourgogne; published. Vol. v., Ponts Etrangers antérieurs au xix. siècle: Italiens, Espagnols et Anglais; 25 francs the volume; not yet published.

For this great work, to be completed in five abundant parts, M. De Dartin has made exact measured drawings from sixty-eight bridges, and each example represents a well-chosen type having great historic interest. The author has taken a line of his own, dwelling on the ornament of bridges, their decoration, and from his earnest study

of the XVIIIth century we learn what he admires in one varied phase of French design. He is thoughtful and thorough, but I wish some photographs had been added to the illustrations, because measured drawings give only the dry bones of constructed work.

How to decorate a bridge is a question beset with so many practical difficulties and so many artistic problems that it ought to be discussed by a congress of architects and engineers. I cannot think that M. De Dartin will say the last word on this important theme, but his material and his personal taste will be invaluable, presenting facts and provoking discussion. He lingers often enough over details of ornament, which, so they seem to me, are superfluities in a bridge, because they swell the cost of production without any real benefit to the mingled utility and dignity needful in bridges.

Kirchenfeldbrücke, Berne.

[Photo. by Frith.]

se qualities should appeal to us in great lines, in rhythmic proportions, and in scale that befits the surroundings. No bridge can be fine and beautiful when it is lifted by its environment or when it trades a neighbourhood. Many engineers do not grasp the truth of this criticism; their metal monsters are often as wrongly placed in a quiet and gentle landscape as a giant from Brodlinz nag would be at a quiet spot. The Roman bridge at Alcantara is noble and heroic just because the scale is in grand accord with the rocky vale of the Tagus. It completes a grand site, finds its own completion in that site. It happened also in the Roman bridge at Narni, by which two mountains were led together across the River Nerva. I have spoken of this bridge in an earlier issue, but may add that in the existing plans, consisting of a pier and a fine arch, there is no applied decoration. The main thing to be noted is the powerful ring of the piers, because, extradosed in a very remarkable manner, it is independent from the spandrels. A bridge with arches of that kind has architectural character, and this quality is obtained by designing arches for

Bridge at Budapest.

designs; and so, if he in his duties as an engineer is to produce art, he must achieve that good thing by deliberate effort and without help from his employers. Every now and again, by rare good fortune, an engineer builds a bridge having some rude grace of its own, some quality that seems a near neighbour to art itself. Thus the

Pont de La Caille on the route between Geneva and Annecy, or the steel suspension over Niagara Gorge, would have little value as a road if even one shell struck the permanent way, so called.

This consideration is one among many that we have to weigh carefully when we wish to look at bridges in their relation to life and art. M. De Darleins. I believe, lingering over decorative features, loses count of the plain fact that bridges ought to show in their construction some fitness for their great work as essential agents in military tactics and strategy. At a time when a secret society of bridge-wreckers, guided and disciplined by a military power, could do incalculable damage to railways and other roads at the outbreak of hostilities, having previously sent two thousand men with explosives into the country to be attacked; at such a time, surely, bridges should not be studied because of their ornamentation. All spies and secret agents could be bridge-wreckers also, and a good many of them may be, for we cannot suppose that strategists on the Continent are blind to the demoralisation that would seize upon an enemy if at the beginning of a war the business of concentrating troops to resist invasion were seriously impeded by shattered railway bridges. Are you not amazed, therefore, that the utility for war in medieval bridges became a lapsed principle, when it ought to have been handed on to our time in a series of adaptations responsive to new conditions? For this principle in bridges, as in battleships, is certainly susceptible of progressive readaptations, if science and art do their duty well.

So my views on the decorative aspect of bridges, like those on other questions belonging to my subject, have for their aim the realisation of what a bridge should be in an age that prepares for war. I am not moved by those types of modern bridge-building that crib from civic architecture, displaying columns, pilasters, niches,

Widnes and Runcorn Transporter Bridge.

special purpose, i.e., to save them as much as possible from the vibration of heavy traffic sent down from the roadway through the spandrels. Still, it cannot be said that all fine Roman bridges were free from redundant ornament. Pomp and pride exerted a bad influence at times; and from the Roman genius later borrowed numerous superfluities that clouded the aspect of bridges in many instances. It is in such Roman work as the Pont du Gard, where no detail is called for and where the architect's aim was to nobly the needs of a well-considered programme, that we realise the utility of clinging to a bridge any detail that neither adds nor calls attention to some thing essential. To construct ornament is easy—is, indeed, a commonplace and taste, while to ornament construction is difficult, because judgment tells us that a design carried out in simple and rough masonry is in itself ornamental and complete. Applied decoration may be it, just as a human face is disfigured by sticking-plaster.

Consider, too, the bridge-builder's own attitude towards his art, for upon that more than anything else the character of his work depends. What has he got now as an inspiration? He has all the self-consciousness that modern life produces; he has also as a dictating the industrial spirit, with its delight in cheapness and its tolerance for hideous

Menai Bridge does not spoil a glorious landscape, unlike the Britannia, a monstrosity that cost 3982. per foot run. From one point of view the Menai Bridge is bad, and we return to an important subject when we note that suspension bridges are so vulnerable as to be unfit public servants in a time of war. They represent a sort of aviation in mechanics, which modern artillery would soon destroy. Any such bridge as the

Clifton Suspension Bridge.

The First Cast-Iron Bridge (about 1780), Coalbrookdale, Severn Valley.

battlements, balustrades, turrets, and towers, pinnacles, statues along parapets, and statues above the cut-waters of piers, with other finery that serves no purpose in the essential life of a contemporary bridge. What Hoskings said in 1842 is good as a criticism to-day. He pointed out that the most eminent engineer-architects, in their efforts to take hints from street buildings, had failed to produce anything but meanness and absurdity, or a combination of both.

What this critic would have said had he lived to see the Tower Bridge, with its spurious medievalism and its biscuit-like aspect, I cannot imagine. Hosking had common sense, and he seems to have been allied with a bad temper. Among the principles that he advocated strenuously I should like to note three:—

1. That bridges, in the combination of their leading lines, should be bold and simple;

2. That infinite care and skill should try to make their passage across dangerous places a secure and safe highway; and

3. That far too much money is wasted in stone bridges on the high finish of exterior surfaces. Hosking was disinclined to regard great city bridges as probable exceptions to this rule, for he said:—"It may be fairly questioned whether both Waterloo and London Bridges would not have been finer objects had the masonry of their external faces been merely rough-axed, or even left scabbled, instead of being fair hammer-dressed; and certainly many thousands of pounds might have been saved in the execution of the former work, and a much better result produced, by the

omission of the coupled columns and their immediate accessories, and by the use of a plain parapet of a more reasonable height, instead of the high, the enormously expensive, and absurdly ugly balustraded enclosures which now aid the columns and their projected entablatures to deform that splendid structure."

This Puritan outlook appeals to me, for I believe that good bridges should be as sternly efficient, as indomitably fit for their purpose, as were the Ironsides of Cromwell's army. Beauty in a bridge is a thing apart from any Cavalier-like finery of dressing ornament. It shows that the different members forming a bridge are co-ordinated with fine judgment, and that the build of each member is in nice accord with its own work and with the great office which the bridge as a whole has to fulfil daily under varying conditions of stress and strain, and in relation to its environment.

When the railway bridge at Ludgate-hill was finished there was a public outcry against its gaunt and shabby ugliness; but as soon as some ornamental metalwork was fastened upon its sides the outcry ceased, as if such a trumphy makeshift could give merit to an imbecile design that disgraced the main road leading to St. Paul's Cathedral. When things of this kind are allowed to happen in the heart of a great city, who can have confidence in civic authorities? What chance is there that new projects for bridges will be considered publicly and officially from the various standpoints determining their value in peace and in war?

Some types of bridge-building stand apart

The Old Brig of Stirling.

Photo. by Frith.

from each other in abrupt contrast. The Tower Bridge, London, and the Roman bridge at Narni, Italy, are separated not centuries only, but by a marked degeneracy in the spirit of craftsmanship. What would be the use of those ornate towers if suspended roadway connecting them on the banksides were cut by a shell or explosives? And what historic relationship exists between the principle of metal suspension and the towers, whose conical turrets and tall pyramidal roofs seem like feeble echoes from the French Renaissance and its Gothic inheritance? The Menai Bridge is better by far, and note that its cables rest on the summit of their support, unlike the tubes of the Britannia Bridge which pass through the towered piers about two-thirds up, so that we wonder how the masonry of the upper parts is upheld. The mistake had its original source in a misunderstanding of two things—first, that a column or a pier is meant to bear a weight placed on the top of it; second, that bridge towers of old were neither decorations nor make-believes, but necessities of medieval town life and warfare. They were to defend the bridge and its service to citizens. Everything that made a medieval bridge picturesque sprang from some public need. A chapel was there for pilgrims and other wayfarers, for instance, and the houses that lined Paris bridges, Old London Bridge, the Ponte Vecchio, and other examples remind us not only that shops on a crowded thoroughfare enriched tradesmen, but that land in walled cities being circumscribed it was frugal to make use of bridges as building sites. The distant past knew how to use with judgment its own opportunities, while bridge-builders of recent times and to-day are apt to produce work that is no constructive art in complete accord with current needs and conditions. The Tower Bridge is a typical affectation.

Note the difference in spirit between the Old Brig of Stirling, that we must place among the best bridges of its period. Its design has a fine rhythm, its round arches are admirably handled, and the simple masonry has vigour and grace. I give, too, by way of contrast, a photograph of the first metal bridge, dating from about the year 1780. At an earlier date, in France, an attempt was made to erect a bridge of cast-iron, but the project was given up as too costly. This occurred at Lyons in 1755. Then an English ironmaster, Abraham Darby, became possessed by the same idea, and he made use of it with practical success in the Severn valley, hard by the town of Ironbridge. Cast-iron was chosen, in ribs consisting of two pieces; and a bold design proved that a new principle could be adapted with grace and efficient skill to the historic tradition of semicircular arches. This bridge still exists. It crosses the Severn in a span of 100 ft. 6 in.; its roadway shelves a little; and perhaps we find in this original work a clue towards the solution of that pressing problem as to the type best suited for a war bridge under present-day conditions. For arches of this kind, strong enough to bear traffic and railways across rivers, might be designed with such abutment piers as would not obstruct the waterway too much. The New Bridge at Mayence belongs to this type. For the rest, the width of arches in a war bridge would be determined by the reasonable degree of ease with which a broken span could be repaired after being cut by a shell; or, if not repaired, made temporarily efficient for light traffic. But it seems certain that a war bridge in any strategic position should have an "understudy"—that is to say, a bridge similar to itself, but at some little distance from it, and having a branch road or line to connect it with the main line or highway. Usual hazards of war, we may suppose, would not be likely to breach both bridges at the same time.

* The total weight of ironwork in this bridge is 378½ tons.

GENERAL NEWS.

Professional Announcements.

Messrs. Newman & Newman, architects and surveyors, have removed their offices to St. James' Chambers, 24, Railway approach, London Bridge, S.E.

Mr. Dan. S. Williams, Civil Engineer, (diff), has been retained by the Town Council to report upon the drainage of the Trough of Llandoverly, and to submit proposals for new schemes of sewerage and sewage disposal.

Junior Institution of Engineers.

Commendators G. Marconi, D.Sc., LL.D., have been elected President of the Junior Institution of Engineers in succession to Sir J. Thomson, F.R.S.

Inspectors of Mines and Quarries.

The Home Secretary has framed a fresh scheme of examination for inspectors of mines and quarries. Candidates must be between twenty-three and thirty-five years of age; they must hold first class certificates under the Coal Regulation Act, and must within five years previously have been employed for two years as managers, or under-managers, of mines, or in some other responsible capacities requiring regular attendance underground in coal mines; practical knowledge and experience of metalliferous mining and quarrying will also be taken into consideration. Nominations to compete will be given only by the Home Secretary upon the advice of a Departmental Committee of Selection, who will reject all testimonials and recommendations that are not based upon personal knowledge of the candidate's character and attainments. The scales of yearly salaries are for junior inspectors, 300*l.*-450*l.*; for senior inspectors, 500*l.*-700*l.*; for divisional inspectors, 750*l.*-1,000*l.*; and there are posts of inspector and electrical inspector. Applications for nomination to a forthcoming examination to fill several vacancies in the ranks of junior inspectors must be made to the Private Secretary, Home Office, before September 15 next.

Liverpool University.

The prospectus of the School of Architecture of the University of Liverpool contains details of a new feature, namely, a certificate in architectural design. This certificate is designed to meet the case of students who wish to come to the School of Architecture for its special teaching in architectural design. Students, unless admitted to the Board of Studies on the ground of special qualifications, must have already obtained the certificate in architecture awarded by the University, or have satisfied the examiners of the Royal Institute of British Architects at the Intermediate standard, or have been exempted at that standard. Candidates for the certificate must have attended approved courses in the School of Architecture, (i.) during one day session, or (ii.) during the autumn and Lent terms of two winter sessions, and have satisfied the Board of Studies in not less than six designs to approved programmes. The examination will consist of a design made in the School of Architecture under approved conditions, for which at least five days shall be allowed. In respect of the Liverpool School of Architecture is alive to the possibilities of good design, and it will be found that under Messrs. Reilly, Professor Adshead, and the associated staff, the courses of study are very considered in the interests of students.

The Polytechnic (Regent-street) School of Architecture.

We have received from the Regent-street Polytechnic particulars of the facilities offered both day and evening courses of instruction in all following, or intending to follow, the various branches attached to the building trades architectural profession. The Polytechnic has been rebuilt during the past twelve months at a cost of 90,000*l.*, and plans appeared in a recent issue of the *Builder*. The School is recognised by the Board of Architectural Education of the Royal Institute of British Architects, also H.M. Board

of Education. The day department is under the control of Mr. G. A. Mitchell, A.R.I.B.A., who was appointed by the Governors of the Institute as architect for the rebuilding scheme. This day school is suitable for youths and young men who intend entering builders' and contractors' offices and works, and for those who wish to follow any of the many designing and constructive industries where an art, technical, and trade training constitute the best basis for future excellence and success. The evening department is intended for those preparing for the various professional examinations, also for the craftsman in the various building trades. Mr. Charles Mitchell, M.S.A., is the Headmaster. To prevent loss of instruction to any who may be unavoidably compelled to be absent from the classes, arrangements have been made this session whereby, for a reasonable number of times absent, upon application by the students, the classwork, together with the homework, will be sent by post. In addition, students are advised to attend the tutorial classes held every Thursday evening in connection with the regular instruction. The object of these tutorial classes is to assist students in keeping up with the regular work of the session, and in overcoming any special individual difficulties. A special course of twelve lectures on "Illumination" will be delivered at the Polytechnic under the supervision of Mr. Leon Gaster. Six lectures of the course will be delivered before Christmas on Tuesday evenings, commencing October 31, and the remaining six after Christmas on Thursday evenings, commencing January 11. The lectures, by specialists, will deal impartially with all illuminants, including recent advances in electric, gas, oil, and acetylene lighting; the effect of light on the eye; the hygienic aspects of illumination; the measurement of light and illumination, etc. Practical problems, such as the lighting of schools, streets, factories, etc., will also be treated in the second half of these lectures.

Birkbeck College.

The eighty-ninth session of the College will commence on Wednesday, September 27. The opening address will be given in the theatre, at 7.30 p.m., by Sir William Tilden, D.Sc., F.R.S. The classrooms, etc., will afterwards be open for inspection, and there will be an exhibition in the art school. Visitors are invited. The College is conducted in relation with the University of London; classes are held both in the day and evening; thirty members of the staff are recognised teachers of the University. The courses of study provide for degrees in the faculties of arts, science, laws, and economics. There is a very complete curriculum for chemistry, physics, mathematics, geology, etc. The laboratories are well equipped with modern apparatus and appliances, and research work is encouraged in all the science departments. The College possesses an art school, which provides instruction in the various branches of artistic work (painting, modelling, life, design, etc.).

Glasgow Improvements.

The City Improvements Trust recommend the Corporation to apply for statutory powers to borrow 100,000*l.* for the completion of buildings now being erected in High and Bell streets, and the reconstruction of the old Tontine and the old Town's Buildings, destroyed by fire on September 3-4 last. The Tontine, formerly the Exchange, was built, in 1782, on the north side of Trongate, at the Cross. The fire extended to the Tolbooth and the old Town Hall, as well as the warehouses and shops which mark the site of the former Jail and Courthouse described in "Rob Roy."

BOOKS.

The Ground Plan of the English Parish Church. By A. H. THOMPSON, M.A., F.S.A. (Cambridge University Press. 1*s.*) THE Cambridge manuals have already established a high reputation. This volume is a distinct addition to the series, and we hope that there will be found enough people interested in the subject to make it a financial success. As the author says, there is

no book entirely devoted to the development of the ground plan of the parish church.

The author knows his subject well, and has handled a somewhat technical subject with considerable skill. His deductions are sound and the plan of his book well arranged. The illustrations are, on the whole, good.

His description of the extension of a church in the Middle Ages is very interesting. The building had to be in constant use. When, therefore, aisles were added to an aisleless nave the aisle walls were built beyond those of the nave, the roof was added, and then the arches and pillars were gradually inserted in the nave walls. Finally, the stonework within the arches was removed, hence Norman walls resting on arches of a later period, and remains of blocked windows, doors, etc.

The author fails, however, to explain the reason for the appearance of the tower, though he doubtless realised it himself.

He is careful to show that towers came into use about the time of the Danish invasion. They were often added to older buildings which originally had none, as at Brighthelmston. Further, a type of church appeared of which the main feature was a large and strong tower, with but rudimentary nave and chancel. Barton-on-Humber is a typical example, the mediaeval church to the east having taken the place of the small Saxon chancel.

This plan vanished in the 13th century. Surely the explanation is that the church, being the one permanent building, became the castle of refuge for the village from the raids of the Danes, and, as such, the tower was the strongest part. Here the villagers could take refuge and await in safety the advent of the relieving force—the levy of all the freemen of the shire—who could be summoned by bell and beacon.

It would be quite possible to bring forward a considerable amount of evidence in support of this view, but this is hardly the occasion for it.

The book is, therefore, valuable not only for the information it affords, but also for the interesting lines of thought to which it gives rise.

Building Construction and Drawing: A Text-Book on the Principles and Details of Modern Construction. By CHARLES F. MITCHELL, assisted by G. A. MITCHELL, A.R.I.B.A. Eighth Edition, revised and enlarged (eighty-second thousand), with about 1,100 illustrations, and 470 pages of text. (London: B. T. Batsford, High Holborn. Crown 8vo, cloth. Price 3*s.*)

It is with pleasure we call attention to the new edition of this excellent book, previous editions of which have been noticed in our pages. The work is designed to meet the requirements of the Board of Education, the Royal Institute of British Architects, the Surveyors' Institution, and other examining bodies, and as an elementary book on the subjects with which it deals it is doubtful if a better work could be produced. The author is not only a well-known lecturer on building construction at the Regent-street Polytechnic, but he is the Headmaster of the Polytechnic Technical School, and having, as he doubtless has, an intimate acquaintance of the difficulties and needs of students, he is well qualified to compile this work in order to meet the requirements of the various examining bodies. In any case, he has written a book which is a model of clearness and conciseness, and which should be in the hands of every student engaged in building construction. The aim of the author has been to give, with conciseness and accuracy, a clear statement of the principles which should govern the execution of building work, and whilst taking due note of all recent advances of importance, to so correlate and illustrate the subject matter of the work as to render it equally valuable as a guide for the student taking examinations, and for the practical man engaged on building. On a perusal of this edition, it will be found to contain the subject matter of the preceding ones carefully revised throughout, together with many items not hitherto treated or specially emphasised. The work is an invaluable one, and we know of no reason why the present edition should not be followed by many others.

EDITORIAL SUMMARY.

The leading article deals with the Renaissance in France—a review of Mr. W. H. Ward's able work, just published, on "The Architecture of the Renaissance in France, 1495-1830."

A second article is entitled "Bureaucracy versus Competition" (p. 322).

Notes (p. 322) include: "The Abuses of Advertising"; "Taxation of Posters No Deterrent"; "The Tattershall Mantelpieces"; "The City Corporation at Vienna"; "State Aid for Housing."

"The Story of the Bridge," by Mr. Walter Shaw Sparrow, is continued this week in part VII., which gives hints on the study of bridge decoration. The article is illustrated (p. 323).

Book reviews (p. 327) include: "Building Construction and Drawing"; "The Ground Plan of the English Parish Church."

In our Correspondence Column (p. 328) will be found letters on "Ventilation" and "A Quaint Text-Book."

The Monthly Review of Engineering, illustrated (p. 331), contains: "Maverick Cotton Mills, Boston"; "Foundation Loads—I"; "Screw Pile at Victoria Pier, Fleetwood"; and Notes.

The Building Trade Section (p. 335) includes: "New York Bureau of Buildings, 1910"; "Old Materials on a Building Site"; "Boiler Explosions in 1910"; "Palmer's Travelling Cradles"; "Asphalt Supplies and Preparation"; "The Strikes and Employment"; "Projected New Buildings in the Provinces."

An article on the misuse of stone is given on p. 339, while on p. 342 are articles on: "Architecture and Sculpture at South Kensington" and "The Manor and the Building of Marylebone."

MEETINGS.

MONDAY, SEPTEMBER 23.

North of Architectural Association. Visits to (1) Stella Hall, by permission of Mr. Jos. Cowen, (2) Aswell Park, by permission of Col. C. W. Napier-Clavering.

The Institution of Municipal and County Engineers. A special general meeting at the Town Planning Exhibition, Gidea Park, Romford, Essex, for the purpose of considering and, if approved of, adopting resolutions as special resolutions as to alterations in the Memorandum and Articles of Association. 3 p.m.

MONDAY, SEPTEMBER 25.

Architectural Association.—Opening meeting of Session 1911-12 of the School of Architecture. (1) Exhibition of Students' Work. (2) Professor Beresford Pile on "Architectural Education." 6.15 p.m.

TUESDAY, SEPTEMBER 26.

Junior Institution of Engineers.—Visit the Electrical Exhibition at Olympia, under the guidance of members of the Committee. 6.30 p.m.

COMPETITION NEWS.

The Tea House at Southampton.

The Public Lands and Markets Committee of Southampton Town Council have had before them a letter from the architects for the Tea House on the Common stating that they found the same could not be erected for the sum of 500l., and that they had altered the specification to bring it within that amount. The Borough Engineer has been instructed to reply to the effect that the Committee could not recommend the Council to proceed any further in the matter owing to the modification of the design and the curtailment of the specification in the matter of construction, especially as such deviation and discrepancies had taken place without the knowledge of the Council. The Borough Engineer was also instructed to obtain the design second in merit and ascertain if it could be carried out for the amount stipulated.

Art Competitions, Stockholm, 1912.

Competitions in architecture, sculpture, painting, music, and literature will be held in connexion with the Olympic Games of Stockholm next year. Competitors should notify their intention to enter for one or more of the competitions before January 15, and send in their exhibits before March 1. Sculptors must submit clay models not exceeding 80 centimetres in any dimension. Applications should be addressed to Olympiska Spelen, Stockholm, or to M. le Président du Comité International Olympique, 20, Rue Oudinot, Paris.

Cemetery Buildings, Newcastle-on-Tyne.

The award of Mr. Cross in the competition for a chapel, a house, and a cemetery wall in connexion with the new burial-ground at Newcastle-on-Tyne is as follows:—(1) Mr. Edward Craftney, of Wallsend; (2) Messrs. Oliver & Leeson, of Newcastle; (3) Mr. Scaife, of Whitley Bay.

The Berne Monument.

Signor Giuseppe Romagnoli, of Bologna, has been selected as the sculptor of the monument at Berne to celebrate the foundation of the International Telegraph Union.

BOOKS RECEIVED.

THE ARCHITECTURE OF THE RENAISSANCE IN FRANCE, 1495 TO 1830. In two volumes. By W. H. Ward, M.A., A.R.I.B.A. (London: B. T. Batsford. 50s. net.)

BUILDING CONSTRUCTION AND DRAWING. By Charles F. Mitchell, M.S.A. (London: B. Batsford. 3s.)

THE MAKING OF A GREAT CANADIAN RAILWAY. By F. A. Talbot. With illustration and map. (London: Seeley, Service, & Co. Ltd. 16s. net.)

CORRESPONDENCE.

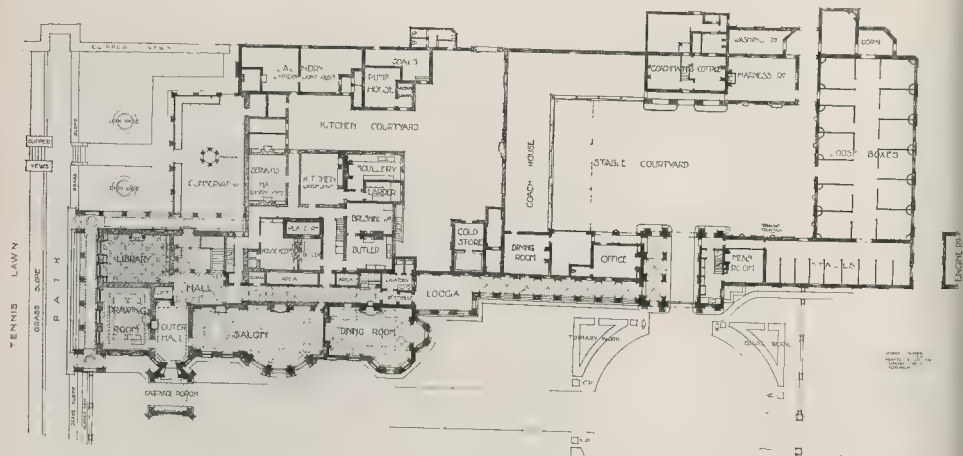

A Quaint Text-Book.

SIR,—From the extracts given in the *Builder* it is evident that the compilers of the "Quaint Text Book of 1734" owed a greater debt to Sir Henry Wotton's "Elements of Architecture" than they seem to have acknowledged. It was there that the "political" caution first appeared not to build "too near a great Neighbour," and it was from the same source that they learned the three conditions of well building: "Commoditie, Firminesse, and Delight." This *trinitas* necessities, if I may so call it, has, however, a higher authority than Sir Henry Wotton, for it appears to be an adaptation of the well-known passage in Vitruvius, Lib. I. cap. II., beginning, "Architectura autem constat ex ordinatione, quæ græce ratio dicitur."

Wotton published "the Elements of Architecture" in 1624. Various opinions have been expressed upon it. Mr. Sidney Lee, in the "Dictionary of National Biography" applies to it the epithet "jeune"; on the other hand, Mr. J. A. Gutch, in "The Growth of the English House," speaks of it as a "sensible treatise." BENJAMIN WALKER.

Ventilation.

SIR,—You referred, in your last issue, to Mr. Leonard Hill's paper read to the members of the British Association. Those whose business it is to design ventilation schemes must bear the brunt of the adverse criticisms, but I think it should be more widely realised that, whereas nine people out of ten will

Sennowe Park, Norfolk.

Mr. G. J. Skipper, F.R.I.B.A., Architect.

that the principle of a "cool moving dry atmosphere" is, at any rate, correct. Any, the difficulty is that the tenth man is just the opposite, and, when his com- is affected, he makes his voice loudly. The other and still greater difficulty is that the men, however much they may enjoy the breeze out of doors, will not endure the lack of movement of air in a room. The difficulties of the ventilating engineer are almost insuperable if his client no longer asked him "to provide ten changes of air per hour without perceptible movement."

S. WHITMORE ROBINSON.

INTERCOMMUNICATION COLUMN.

Fungus and Boarding.

About twelve months ago I had to have a builder to take up the whole of the boarding in my middle room, as the boards were eaten away by a kind of fungus. They were relaid again, but once more the same thing attacked the boards, making it necessary to take them out, as the wood was rotten. I then had the room covered with white-painted boards. About a month ago I noticed that the same white-coloured fungus was making its appearance in the skirting and around the frame, making it necessary to remove the same. There is a peculiar and nasty smell about the fungus, and it appears to make the wood quite rotten.

I have consulted a builder, who cannot understand what it is, and cannot suggest anything to remedy it.

My object in writing to you is to ask whether you can give me advice, as the growth seems to spread rapidly, and I am afraid that it will get into my front room boards.

The fungus is of a creamy colour, and has a very damp feeling when touched. There are no damp courses to the walls, but the worst part is that it attacks the walls on the inside of the house, and not the outside.

ILLUSTRATIONS.

Design for the National Museum of Wales.

THE plans and elevation of this design by Messrs. Lanchester & Rickards were published in our issue of April 23, 1910. The drawing from our plate is taken was exhibited in the Academy this year.

Sennowe Park, Norfolk.

Extensive enlargements and alterations have been lately in progress to fit Sennowe Park, Norfolk, as a residence for Mr. Cook, are now completed.

The drawing reproduced on one of our plates shows the nature of the work on the entrance, and the south fronts. The right-hand object in the view is the entrance to the stable courtyard, and from this the road leading to a loggia under which is the entrance to the hall itself. The composition and design of the hall were largely determined by the existing building, the retention of which was desired; hence the two round turrets and the position of the loggia porch.

From the plan (p. 328) the scheme will be seen to embrace not only very large additions to the hall, but the complete range of stabling, coachhouses, motor garage, and electric power house, also an entirely new winter garden, water and belfry tower, laundry, etc., and beyond these buildings the terrace gardens have been largely extended, and the whole forecourt has been formed wholly new. Virtually the gardens have been completely redesigned and enlarged by tennis and croquet courts, a rose-garden, and a water-garden. From the water-garden a pergola leads to the pathway from the garden grounds to the rhododendron walk, running beside the stream, crossing it, and extending itself round the further, or south, side of a v-shaped lake of some 8 or 9 acres in extent. All the drives have been re-formed and new approaches made through the plantations to the hall connecting themselves up to

Sennowe Park, Norfolk: South Colonnade, showing Mr. H. C. Fehr's Figure, "Evening."

Mr. G. J. Skipper, F.R.I.B.A., Architect.

the pine avenue, which leads from the hall, past the gamekeeper's cottage, to the new lodges known as the Ryburgh Gates.

In an opposite direction an entirely new avenue, some three-quarters of a mile in length and in width about 120 ft., with double lines

of elms and grass galloping tracks on either side of the broad carriage road, leads from the park to the new lodges known as the Norwich Gates.

The main reception-rooms were finished off in oak and hard woods, and a saloon some

Sennowe Park, Norfolk: The Water Garden.

Mr. G. J. Skipper, F.R.I.B.A., Architect.

55 ft. long was carried out in Italian walnut.

Mr. George Riches, of Cromer, was the general contractor for the work, whilst the whole of the stonework has been carried out by Mr. E. W. D. Potter, of Norwich.

The exterior stone carving has been executed by Messrs. Farmer & Brindley, of Westminster, including the figures on the attic of the entrance front and also a good deal of the interior wood-carving.

Mr. H. Fehr, of Fulham-road, London, has executed many figures in bronze and stone and also many sculptured animals and birds to decorate the different gardens.

The decorative mural paintings of figure and sporting subjects were partly the work of Mr. George Murray, of London, and partly from the brush of the late Mr. W. J. Neatby, of London.

An oak staircase, with carved scroll foliage and flowers, the surrounding walls enriched with moulded oak panelling, is a feature of the interior.

The stable fittings and heating were carried out by Messrs. Musgrave & Co., of Belfast and London.

The gates and other wrought-iron fittings were made by Messrs. Singer, of Frome, and by Messrs. Hardman, Powell, & Co., of Birmingham.

Messrs. Wm. Paul & Sons, of Waltham Cross, carried out the whole of the garden work, topiary work, and all the planting in the different clumps and enclosures in the grounds and park.

The formation of the lake, the terrace gardens, and the whole of the roadwork was carried out by Messrs. Mornement & Ray, of East Harling. Mr. A. W. Roy acted as clerk of works.

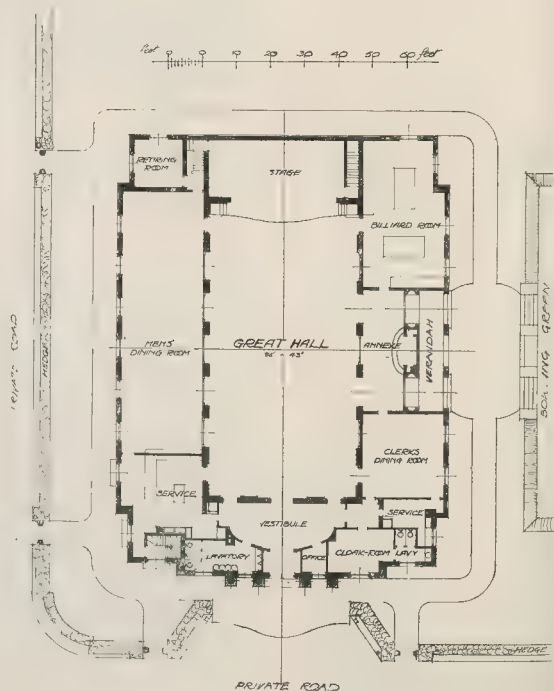

The whole of the undertaking, including the gardens and road works and also the interior decorations, was carried out from the designs of Mr. George J. Skipper, F.R.I.B.A., architect, of Norwich, with whom Mr. F. W. Skipper was in partnership at the time.

Recreation Hall, Southall.

This building has been erected at a cost of 11,000*l.* by Messrs. A. Marshall Mackenzie & Son for Messrs. Otto Monsted, Ltd., margarine manufacturers. It is well situated in front of the works at Southall, among trees, and overlooking bowling-green and tennis-lawns. The walls are finished in cement, painted white, and the roofs are covered with black Dutch tiles. The builders were Messrs. A. & B. Hanson, Southall.

The Story of the Bridge.

THE views of the Moselle Bridge, Coblenz, and the New Bridge, Mayence, are given in connexion with Mr. Shaw Sparrow's seventh article (p. 325).

Recreation Hall, Southall.

FIFTY YEARS AGO.

From the *Builder* of September 21, 1861.

The Breakwater at Portland.

THE breakwater at Portland is finished, and the *Times* has given a warmly coloured account of the success which has been achieved. The writer says the shape of the breakwater is an obtuse angle, stretching from the island at first towards the north-east and then turning away due north in deep water, half across the splendid bay. Apparently, as one stands on the shore and looks along the interminable rows of black timbers peering up starkly out of the shallow reef of white stones, there does not seem a great deal to show for nearly thirty years of constant labour, for the fruits of this toil are, of course, beneath the water, the restless waves were away the visitor would behold a sort of ridgy mountain, or at least, a hill of colossal stones, more than a mile and a half long, 100 ft. high, and 300 ft. wide at its base.

PUBLIC WORKS LOAN COMMISSION.

The annual report of 1910-11 shows that the Commissioners have made advances to the aggregate of 3,860,301*l.*, whereof 311,443 was advanced for the provision of dwellings for the working classes, the loans being secured upon property of the London Housing Society, Ltd., East End Dwellings Company, Hampstead Tenants, Ltd., and several other kindred societies.

PAISLEY ABBEY.

The old houses in Gauze-street that have just been pulled down were constructed to a considerable extent of worked stone from the Abbey adjacent, which was founded in about 1160 by Walter Stuart, ancestor of the royal house of Scotland. The carved and moulded stones have been carefully preserved for return to their original uses in the restoration of the Abbey.

MONTHLY REVIEW *of* ENGINEERING.

Fig. 1. Maverick Cotton Mill: General View (July 27, 1910).

MAVERICK COTTON MILL, BOSTON, U.S.A.

Our issue of April 28 last details were given of the Massachusetts Cotton Mill, built over a canal, from the plans of Messrs. Lockwood, Greene, & Co., Boston. In the present article we illustrate the main structural features of another cotton mill designed by the same firm, also were the general contractors.

The building is of interest as an example of construction in reinforced concrete, shown by the photographs reproduced, also by the record of 100,000 sq. ft. of surface completed within one month.

It was at first intended to adopt what is called in America ordinary "mill construction," but, as the tenders submitted by building contractors were considered too high, copies of the plans prepared by Messrs. Lockwood, Greene, & Co. were sent to two construction companies, leaving their own system for reinforced concrete. One of these was the Hennebique Construction Company, of New York, whose plan was ultimately accepted on the basis of drawings prepared by them from general drawings.

Located at East Boston, at the northern end of the harbour and opposite the main part of the city, the buildings occupy a large area near the water front, as shown by Fig. 1, which is a general view of the spinning mill taken four months after the commencement of the concrete work.

The mill comprises four buildings:—(1) spinning mill; (2) weaving shed; (3) power house; (4) office building.

The spinning mill is 550 ft. long by 130 ft. wide by two stories high, and is built in bays measuring 25 ft. by 10 ft. 8 in. in plan. It also has a basement story, and provision was made in the design of the columns for adding two stories above the existing flat roof, which will then become the second floor of the building. The mill equipment at present includes 50,000 spindles for cotton spinning.

The soil on the margin of the harbour at East Boston is of marshy character, and to enable it to support the weight of the buildings was consolidated by means of timber piles driven during the autumn of the year 1909. Upon these piles were constructed the footings of the exterior and interior columns supporting the reinforced concrete skeleton of the mill, this framework being monolithic throughout and comprising columns, wall lintels, main girders, joists, floors, and roofing.

Construction was commenced at the beginning of March, 1910, the position of affairs on March 7 being indicated by Fig. 2, representing the erection of moulds for the reinforced concrete columns. This view shows the chaotic state of the site of that period, with the column moulds in long trenches partly full of surface water. In the background may be seen the centring for four of the saw-tooth roof spans of the weaving shed, and the construction tower provided for handling concrete and other materials.

The rapidity with which operations were

pushed forward is shown by comparing Fig. 2 with the photograph reproduced in Fig. 3, taken on May 4, or only fifty working days later, when a large area was covered by the moulds for beams at ground-floor level, several bays the full width of the building were partly completed to first floor level, and several others to roof level. In Fig. 3 a second construction tower may be seen at the right-hand side for serving men engaged on the mill building, the weaving shed and its construction tower being hidden behind the spinning mill.

The rapid progress made during the months of May and June is sufficiently indicated by Fig. 1, which is from a photograph taken on July 27, but we are informed that as a matter of fact all the concreting on the spinning mill was completed by July 1. Each of the floors in this building covers an area of 74,000 sq. ft., the total area of the three floors and flat roof being about 6½ acres. Operations were undoubtedly facilitated by the large amount of duplication in the design, which not only conduced to rapid work, but also to economy of timber used in the form of moulds, shuttering, and centring. The moulds were used four times on different parts of the building.

The weaving shed, providing accommodation for 1,200 looms, measures 340 ft. by 231 ft., and is designed with bays of 26 ft. by 21 ft. 4 in. in plan. It comprises basement and ground floor stories, the latter covered with a roof of the saw-tooth type.

Fig. 2. Spinning Mill: Erecting Column Moulds (March 7, 1910).

Fig. 3. Spinning Mill: Constructing Framework (May 4, 1910).

Fig. 4. Weaving Sheds (April 20, 1910).

Fig. 5. Weaving Sheds (May 24, 1910).

Arrangements have been made for enlarging this building to four times its present capacity.

Construction was commenced towards the end of February, 1910. By April 20 a considerable portion of the building had been completed, including roof trusses and covering, and a large area provided with columns and timbering for concreting the ground floor. This stage is illustrated by Fig. 4, in the foreground of which can be seen the pits excavated for the construction of further columns on the area to be covered by the basement floor.

Fig. 5 indicates the substantial progress made during the succeeding month. The building was completed early in June so far as concerns the reinforced concrete work. A noteworthy feature of the shed is that the roof trusses and roof covering, except where glazing occurs on the north side of each span, are entirely of reinforced concrete. Although more costly than steel roof trusses, and ordinary covering, this method of construction is undoubtedly good, regarded from the standpoint of fire resistance, and it also has the merit of permitting the entire building to be moulded as a monolithic structure.

The power-house is a comparatively small building, measuring 80 ft. by 62 ft. in plan, and comprising a single-story boiler-room, with basement and a single-story engine-room. This building was commenced in May and completed during July. The office building, 40 ft. long by 30 ft. wide, with two stories and basement, was constructed about the same time.

FOUNDATION LOADS.—I.

IN an instructive lecture delivered several years ago Professor Boyd Dawkins discussed the relation of geology to engineering, with special reference to the utilisation of subterranean water for the benefit of the population. The study of geology is naturally of much importance in other branches of engineering work involving operations at considerable depths. In architectural practice the science of geology affords less aid to the designer, who is usually occupied with glacial drift and comparatively recent accretions of surface material.

Hence a moderate knowledge of geology will carry the architect a long way—at any rate, so far as concerns building construction in countries not subject to serious earthquakes.

Numerous ancient buildings in all parts of the world show conclusively that early architects devoted much thought to the nature of the ground on which they were about to build, and that they adopted precautions which in principle are closely allied to modern methods.

One excellent illustration of this fact is afforded by the foundations of the Campanile of St. Mark, Venice, which, as originally proportioned, proved capable of sustaining enormous pressures for more than a thousand years, and still remain in the foundations of the new tower.

The original Campanile was a marked exception to the general rule that failures of masonry work are more frequently due to

defective foundations than to weakness of the superstructure.

Other buildings of considerable age demonstrate the fact that early architects did not always carry the practice of applied geology quite far enough to ensure permanent stability. Winchester Cathedral and St. Paul's Cathedral illustrate this point, for, as shown by recent troubles, a somewhat greater foundation depth would have rendered these structures independent of the causes which have gradually reduced the bearing power of the upper strata.

In mentioning these examples we intend no slur on the memory of the original designers, our object being merely to indicate the connexion between geology and architecture.

Although the largest buildings erected to-day do not surpass in magnitude those constructed ages ago, the average dimensions, and particularly the height of modern buildings, has very much increased in cities and towns. Consequently, architects feel more than ever before the need for careful investigation into the design of foundations and the loads that may safely be imposed upon various kinds of rock and soil.

This attitude is denoted in a sense by the action of the Science Standing Committee of the Royal Institute of British Architects in asking members to furnish particulars of their personal experience concerning foundation loads.

Although heartily in accord with the movement in question, and believing that it will bring forth much interesting information, we are not sure that the facts collected will be suitable for anything more than general guidance. One reason for this supposition is to be found in the fact that conditions vary considerably according to locality and even in the same locality, and another is the difficulty of obtaining exact data which lend themselves to comparison.

A somewhat kindred appeal on the subject was recently made by an eminent American civil engineer, with the result that out of 300 engineers in various countries who were asked to contribute information as to safe pressures on foundations, only thirty replies of any value were received. Even those were indefinite on important matters connected with the pressures and local conditions.

The architect who builds upon solid rock is free from the uncertainty attaching to the pressure that may be applied to many kinds of soil, for all but the softest varieties of rock are capable of sustaining with perfect safety the greatest load due to any form of masonry foundations. Table I. gives the minimum and maximum results of numerous tests on some representative varieties of British rock, and for comparison the results obtained between 1883 and 1905 at Watertown Arsenal, U.S.A.

TABLE I. COMPRESSIVE RESISTANCE OF VARIOUS ROCKS TESTED IN THE FORM OF SMALL CUBES. RESULTS IN TONS (2,240 LB.) PER SQUARE INCH.

Kind of Rock.	British.	American.
Granites	144-1,614	131-1,780
Basalts	768-1,980	—
Slates	658-1,982	—
Sandstones	70-956	243-1,550
Limestones	156-778	280-965

Owing to the fact that available data concerning the compressive resistance of rocks have been furnished by testing cubes of different sizes, it is impossible to collate figures in the form of a table giving a reliable guide to the relative strength of strata occurring in various districts of the kingdom.

Moreover, it is known that a given volume of material under compression exhibits much greater resistance when incorporated in larger mass of the same material than that shown by the same volume in the form of a test cube.

Thus, a 12-in. cube examined in the testing machine will not bear so heavy a pressure as can be applied to an area of 144 sq. in., constituting part of the surface of a block measuring, say, 10 ft. in every direction. The reason for this increased resistance is obviously to be found in the lateral support furnished by the surrounding material at the distribution of the pressure over a large area. But it is not easy to compute with any degree of accuracy the greater strength so afforded.

Professor Ira O. Baker states in his standard treatise on "Masonry Construction" the results of experiments made by him with the object of establishing the ratio of the crushing pressure distributed over the whole surface of a block and the crushing pressure concentrated on a small portion of a block.

Table II. gives the results of the experiments, where the concentrated pressure was applied by means of a steel die, with the area of 0.277 sq. in., at varying distances from the corner of a large block, and the ordinary crushing strength was obtained by testing to destruction cubes of the same materials as used for the first experiments.

From this table it is clear that the resistance increases very rapidly with the thickness of the block, and with the distance of the concentrated pressure from the edge of the block.

These results, which are of special interest, should be found useful for guidance in various classes of design, as well as in connexion with the bearing power of rock.

If any uncertainty exists with respect to the adequate strength of the rock which is to form the site for a building, the proper course is to have carefully-selected specimens tested, and to take the safe-bearing load at one-eighth the compressive resistance of the weakest cube.

Whatever be the nature of the soil revealed by the excavation of foundation-pits or trenches, it is always necessary for the designer to know something of what lies below. In the case of moderately-heavy buildings, examination should be made to the depth of from 3 ft. to 5 ft., while for very heavy buildings trial borings should be carried down to much greater depths in order that the character of the underlying strata may be reliably gauged.

A simple and effective method of determining the bearing power of the soil in doubtful cases is to apply a test load to a square foot or square yard of the surface exposed by excavation or at the bottom of the hole dug for the purpose. By observing the consequent settlement, it is easy to arrive at a trustworthy conclusion. At the same time the designer must take due account of attendant circumstances, such as the compactness of the soil, the probable influence of variations of the underground water level—

II.—COMPRESSIVE RESISTANCE OF VARIOUS MATERIALS UNDER CONCENTRATED AND DISTRIBUTED PRESSURES. (IRA O. BAKER.)

Material.	Thickness of Block.	Centre of Die from Edge.	Crushing Strength.		Ratio.
			Concentrated Pressure.	Distributed Pressure.	
	In.	In.	Lb. per sq. in.	Lb. per sq. in.	
Lime mortar	1	2	3,610	3,430	27
Marble	2	2	18,050	10,500	17
Marble	2	2	36,100	10,100	36
Brick	2	2	11,880	3,650	11
Limestone	3	2	31,046	3,433	9.0
Sandstone	3	2	51,600	3,696	14.0
Limestone	4	2	75,361	4,761	16.0
Limestone	7	2	64,077	3,153	18.5
<hr/>					
Sandstone	3	2	51,600	3,696	14.0
Sandstone	3	3	59,204	3,696	16.0
Sandstone	3	4	75,810	3,696	20.5
<hr/>					
Limestone	4	2	75,361	4,761	16.0
Limestone	4	3	102,900	4,761	22.0
Limestone	4	4	111,388	4,761	24.0
<hr/>					
Limestone	7	2	64,077	3,433	18.5
Limestone	7	4	57,720	3,433	25.0

experience and discrimination being of no value should never be overlooked. Classification, even if accompanied by the most complete obtainable records of bearing, could afford a true and precise notion of the safe load for soil in different strata. The various kinds of soil do not have standardised qualities like manufactured products, they are found in strata of varying consolidation and thickness, and are less intermixed one with another, and less permeated by water.

CREW PILES IN THE
VICTORIA PIER, FLEETWOOD.

A new promenade pier opened at Fleet-
June last is a structure of steel and
with a timber jetty, and includes
the offices and a bandstand, with pro-
for the erection of a pavilion suitable
concerts and other entertainments.

ward end is situated on the fore-
point opposite Windsor-terrace,
Fielden Esplanade, the work having
been executed by the Fleetwood Victoria Pier
Co., Ltd., to the designs of Mr. J. E.
Hobbs, civil engineer, of Blackpool.

entrance offices and approach are constructed on a foundation formed by filling with stone, boulders, brickbats, and sand. The space bounded on the south side by the wall of the Fielden Esplanade and on the north, east, and west by new concrete walls. The entrance building is of brick, and provides suitable accommodation for the paymaster and stores. All columns or piles in the

and stores. All columns or piles in are of cast-iron with bracing of steel rails, girders, and joists being of mild with the exception of some timber joists top of the cross girders, and the is of crooked timber.

own in the accompanying illustration, are of 10-in. diameter, with a screw for a pointed end for driving to the length, and the requisite collars, caps, braces to the upper lengths. As the

ages to the upper lengths. As the
of construction are clearly shown in
wing, it is unnecessary to state them
The piles fitted with screw flange were
into position and sunk sufficiently

laid a firm and solid foundation in the soil underlying the sandy bed of the sea. In cases where the piles were driven in the ordinary way, they were sunk by vertical movement of not more than 10 ft. as caused by ten blows of a 20-cwt. hammer falling from the height of 6 ft.

piles of the type employed at Fleet-
er originally invented by Mr.
Mitchell, and have been largely
in India for the foundations of rail-
edges, as well as in marine works of
kinds throughout the world. Owing
greatly extended area of the bottom
the bearing power of screw piles is
onately large, and may often be
as an economical means of forming
foundations in soil of unstable nature.

ENGINEERING NOTES.

Deep-Level Aqueduct, New York.

Deep-Level Aqueduct, New York. TO BRING water from the new reservoir at Hill View in Yonkers, through the Borough of the Bronx and Manhattan Island, and under the East River to Brooklyn, it has been decided by the Board of Water Supply to construct an aqueduct in the form of a tunnel about 17½ miles long, ranging in diameter from 11 ft. to 15 ft., and in depth from 200 ft. to 750 ft. below surface level. This important engineering work will be executed throughout in solid rock, consisting of the gneiss, schist, and limestone formations underlying New York City.

The tunnel will be lined with concrete, with the average thickness of 15 in., and special provision made for backing in places where soft rock may be encountered. The plans make provision for the distribution of water by way of twenty-three uptake shafts of 14 ft. diameter in each of which will be placed a 4-ft. diameter uptake shaft. Twenty shafts will be devoted to drainage purposes, one at a low point of the tunnel near the Harlem River, and another at the lower end of Manhattan Island. During construction the twenty-three shafts will be used as bases for the conduct of driving operations, as also will an additional shaft to be sunk at the northern end of the

tunnel, and afterwards filled up with concrete. Although careful geological investigations have been made by experts on behalf of the Board of Water Supply, the contractors cannot be sure that the rock will be sound throughout, and that there will be no risk of water from various underground springs. The tunnel is so great a depth as to prohibit the use of compressed air, and success can only be attained by pumping out water faster than it flows into the workings. Electrically-operated pumps will be employed throughout, and in cases of emergency the various power-stations in the city can be drawn upon for current. Therefore, given ample resources in the form of pumps, there should be no lack of motive power. Of course it is quite possible that water may be liberated in tremendous volume, but it is hoped that trouble may be averted by keeping the tunnel lined well up to the working face and by driving advance headings to tap underground springs before they can deluge the workings. Nevertheless, the risk both to the contractors and the city authorities is of sufficiently onerous nature to be well employed. The main aqueduct for the distribution of 500 million gallons of water daily to the various districts of Greater New York along the line. The undertaking is a remarkable illustration of the arduous tasks rendered necessary by the continued growth of large cities in modern times.

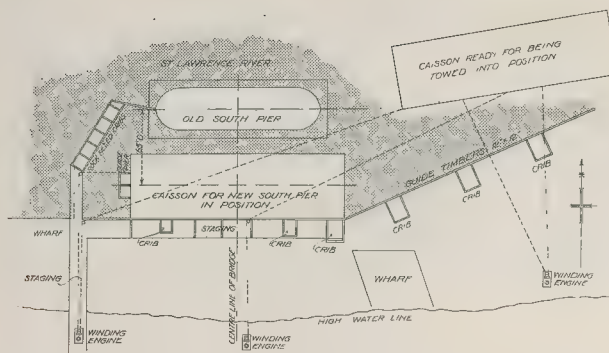

New Station
Buildings at
Baker-street.

New Station Buildings at Baker-street. THE Metropolitan Railway Company have commenced operations on the new building for Baker-street Station, with a frontage of 200 ft. long on Marylebone-road. Additional accommodation for trains will also be provided, including arrangements that will afford much-needed

facilities for the heavy traffic into and out of the City. A feature of the new building will be a spacious concourse 80 ft. long by 50 ft. wide, with stairways of ample width leading down to the station proper. At present the building will only extend to the height of one story above street level, but later it is intended to carry up the building in the form of a large hotel.

Victoria Pier, Fleetwood. Screw Pile.

Quebec Bridge Pier Caissons.

For the new piers destined Quebec Bridge to support the giant cantilever of the Quebec Bridge, three large caissons have been built—one for the south pier, 181 ft. long by 55 ft. 6 in. wide, and two for the north pier, each 85 ft. long by 60 ft. wide.

Caisson No. 1, completed last year, was originally intended for the north pier, but, owing to difficulties in the way of sinking it there, was removed to the dry dock at St. Joseph de Levis and kept there until the present spring. After having been strengthened and thoroughly caulked it was floated out and towed into position by the aid of steam tugs and winding engines, as shown in the accompanying diagram. This caisson is placed 65 ft. south of the old pier, centre to centre, a space of 10 ft. clear being left between the two structures. As the river bed is free from water at low tide the site was levelled in advance, and to assist operations a breakwater of rock-filled cribs was built on the up-stream side, as well as the staging and guide timbers shown in the plan.

The caisson was floated out of the dry dock on May 28 and towed to within about 150 ft. from the bridge, a distance of some 9 miles. Four steel wire cables connected with the winding engines were then attached, and the huge structure was successfully drawn into position, the only difficulty experienced having been to guide it in the rapid current due to the incoming tide. The caisson drew 10 ft. of water, the unsubmerged portion being 30 ft. high.

Caissons No. 2 and No. 3 for the north pier are completed, and were towed into position in May and June last. No. 2 has been sunk several feet below the river bed, and the sinking of No. 3 has been started by this time. These two caissons were 33 ft. high at the time of launching and drew 8 ft. 6 in. and 9 ft. of water respectively. They have been placed 65 ft. to the south of the old north pier, centre to centre, thus providing for the cantilever span of 1,800 ft., as in the original bridge design.

A PAPER read before the Institution of Heating and Ventilating Engineers by Mr. E. R. Dolby, M.Inst.C.E., discusses some of the methods used at the present time to determine the effective head in low-pressure hot-water installations where gravity alone is relied upon to produce the required circulation. Assuming a simple case where the water column is 40 ft. high, the flow temperature 200 deg. F., and the return temperature 160 deg. F., Mr. Dolby gives the head calculated by the formulae of four well-known authorities as follows:—

Hood	6.838 in.
Baldwin	6.708 "
Carpenter	3.900 "
Rietschel	6.710 "

It is seen, therefore, that, whatever be the methods adopted by Hood, Baldwin, and Rietschel in the particular case cited, the results differ very little, but that the head given by Carpenter's rule is only about 53 per cent. of the average value of the other three.

Professor Carpenter, in "Heating and Ventilating Buildings," states that "most computations of the velocity of circulation of hot water have entirely neglected the effect that the mass or weight of the water moved has

on the velocity, and hence the results as computed have been many times greater than actually found." On another page he says:—"As result of experiment the writer found considerable variation in different measurements of velocity, but in no case did he find a velocity greater than that indicated by the formula." The formula in question is:

$$V = \frac{2gh(W_1 - W)}{(W_1 + W)}$$

where W_1 represents the weight of water in the return column, and W the weight of water in the flow column.

The author admits Professor Carpenter to be one of the first authorities on heating in the United States, while pointing out that Professor Rietschel has for many years been esteemed one of the foremost authorities on the subject in Germany. Apparently it is owing to the great difference between the results given by the formulae of these authorities that Mr. Dolby calls into question the theory of Professor Carpenter.

At first sight, he says, it would appear that it should be easy to determine which of the two formulae is the correct one, but the matter is not so simple as it appears, accurate results depending upon a correct estimation of the frictional resistance of the internal surface of the pipes used, and the diminishing viscosity of water as temperature increases.

Discussion on the paper will be continued at the October meeting of the Institution, when it is expected that several interesting communications will be forthcoming.

The Risorgimento Bridge, Rome.

CONNECTING the artistic and ethnographic sections of the International Exhibition in Rome, the bridge opened this year across the River Tiber is remarkable as including the longest reinforced concrete arch hitherto completed, the clear span being 328 ft. and the rise 32.8 ft. The arch proper consists of a curved slab, approximately 66 ft. wide, 18 in. thick at the springings, and 8 in. thick at the crown. The spandrels are hollow, being formed of longitudinal and transverse walls and partitions supporting the roadway above. The abutments are founded on piers sunk by the Compressol system, and, like all other parts of the structure, consists of reinforced concrete. This notable work, which has been tested to the satisfaction of the city authorities, was executed by the Porcheddu Company, having been commenced in November, 1909.

Lifting Magnets.

AN application of electricity which has not received the attention in this country that it deserves is indicated in the title of this note. A recent paper by Mr. H. F. Stratton, of Cleveland, U.S.A., gives particulars demonstrating the practical utility of lifting magnets in the iron trade. For a foundry turning out 35 tons of metal daily the crane and magnet installation with the lifting capacity of 1,350 lb. is about 800l., and the cost of handling pig-iron is not more than 3d. per ton. Depreciation is stated at 14l. per ton, thus bringing up the total cost to 25l. per ton. As the cost of handling by manual labour is probably about 5d. per ton, the economy of the magnet plant is obvious.

Electric Cooking Apparatus.

In the *Journal of the Institution of Electrical Engineers* a paper by Mr. Harold Gray discusses the position of "Electric Heating as Applied to Cooking Apparatus," a subject of considerable interest to many of our readers in their professional capacity. The author forwards the strong and weak points of electrical system with the object of indicating the directions in which further improvements are required to popularise a method of cooking possessing obvious advantages over gas from the hygienic standpoint.

Perhaps the most important piece of electrical cooking apparatus in general use and the which is most difficult to make satisfactory operation is the oven. Some makers for the lines of the gas range by combining oven with hot plates and similar appliances. Others make the oven an independent apparatus, an arrangement generally giving the most satisfactory results. It should be noted that the heat-energy applied inside an oven is consumed and lost in three ways: (1) Conduction, (2) loss by radiation, (3) loss due to escape of hot air chiefly when the door is opened. The greatest loss is that due to the fact that if the oven can be arranged so that the heat is only opened when the food is in and taken out, considerable heat economy may be effected.

The author has devoted some time to the problem of electric oven design, and believes that the whole secret of success depends on three things—the provision of uniform heat throughout the cooking space, and a steady circulation of the hot air currents in the correct direction to avoid "airlocks" over and around the food. Given these two conditions the cooking

Gray's Electric Oven.

perfectly uniform throughout the oven, and the door need not be opened periodically for the purpose of changing the position of the object under treatment. It is essential, however, that there should be a light inside and an inspection window, as well as an interior thermometer indicating the temperature.

The accompanying sketch illustrates the arrangements of the electric oven devised by Mr. Gray. Heat is generated by two elements at the bottom, the heated air rising in two side flues formed by plates, emerging at the top in the oven proper. After permeating the cooking space the heated air again passes over the heating elements, as shown by arrows, and the cycle is repeated as long as required. The oven is surrounded by lagging, from 1 1/2 to 2 in. thick, composed of slag wool or fire-divided asbestos.

The type of oven described represents an immense advance on the ordinary electric gas, or fuel oven, where too much top, bottom or side heat usually prevails, its uniformity of temperature, and the perfect distribution of heat being specially noteworthy features. Compared with a gas oven, where the food is bathed in the products of combustion of impure gas, the apparatus shows to much advantage and from figures given by the author it appears that the average cost of operation is not more than that of a gas oven.

The paper to which we refer will probably have the effect of stimulating the endeavours of electrical engineers to advance the application of electricity in the direction indicated, and may be commended to the attention of architects concerned in the equipment of public institutions, hotels, and other buildings where hygienic cooking is an important consideration.

THE BUILDING TRADE.

NEW YORK BUREAU OF BUILDINGS IN 1910.

REPORT just made by the Borough President of Manhattan by Mr. R. P. Miller, M.Am.Soc.C.E., records the operations of the Bureau of Buildings for last year, and in addition the customary statistics containing a deal of information which should be of interest to builders and public authorities in our country.

Building Applications.

The activity of building contractors on a small site where every square foot of land is saved, public parks and open spaces, long ago been allocated, is shown by the fact that in 1910 plans were approved for buildings to cost over 20,000,000, and for 800 new structures representing hundreds of millions of dollars. The average cost of building amounted to 25,000. Compared with the figures of 1870 for the entire city, including Manhattan and much of the Bronx, these for 1910 show two-and-three times the number of buildings and the value per building, the comparison appearing more remarkable when it is borne in mind that at the earlier date the rate of natural development was still in its infancy. The following table gives an analysis of building applications during 1910, excluding applications to existing structures:—

Kind of Building.	No.	Total Cost.	Cost per Building.
Residential Houses	43	\$31,369	\$729
Commercial Houses	208	7,384,600	35,500
Factories	7	191,000	27,286
Warehouses	230	6,106,940	26,550
Buildings	44	2,475,139	56,230
Shops and Workshops	33	441,880	13,388
Stables	11	481,400	43,760
Garages	12	325,000	27,080
Public Buildings	8	631,600	78,950
Private Buildings	10	530,420	53,042
Unfinished	20	29,544	1,477
Unknown	143	\$1,941	\$13

Types of New Buildings.

The satisfactory feature presented by the figures in respect of which applications were made is the large proportion represented by existing construction, as demonstrated in the following table:—

Kind of Building.	No.	Per cent. of Total.	Floor Area sq. ft.	Per cent. of Total.
Existing	250	31.0	19,128,300	68.0
New	413	51.3	8,768,200	31.2
Unknown	136	16.9	201,000	0.7
Total	800	100.0	28,097,500	100.0

Of the fire-resisting buildings are in Murray Hill district, bounded by Third, Twenty-sixth streets, and Lexington and Avenues, but a good many are situated in districts largely occupied by office buildings.

Breaches of Law.

During the year cases relating to lift regulations, breaches of the building law were reported. It is somewhat surprising that nearly 22 per cent. of these were in connection with new buildings and alterations at all. A class of violation that has been particularly troublesome is the use of frame buildings within the fire zone where such structures are prohibited. In the buildings have been completed an injunction could be obtained. The attempt of attempting to enforce the building law by levying fines is emphasised in the report, and it seems clear that prompter and more drastic punishment are needed to insure obedience.

Unsafe Buildings.

During the year 2,341 buildings were reported as unsafe, and of these 1,995 were made safe by the owners on order from the Bureau, in 104 others application to the Supreme Court had to be made, and in others, again, the buildings were demolished.

One very useful duty of the Bureau, finding no counterpart in Great Britain, is that of undertaking all emergency work that may arise in connexion with building operations. Thus the Bureau attend directly to the shoring or demolition of buildings that have partially collapsed, the object being to safeguard the public with the least possible delay. In one special case last year they had to dig out the body of a man who had tunneled under Ludlow street for the purpose of robbing a jeweller's shop, and was killed by a fall of the tunnel roof.

Fire Escapes.

The report states that strenuous resistance is offered to orders made by the Bureau, in compliance with sects. 103 and 108 of the Building Code, to provide adequate egress from buildings in case of fire or panic. Complaints as to the lack of facilities have been received from several sources, including the State Factory Inspector and the Fire Department. During 1910, some 872 cases were reported in which exit facilities were absent or defective, and we learn that a large number of cases still await settlement, many of them being from two to seven years old. This is a state of things clearly demanding attention. The 872 cases mentioned are thus analysed:—Outside escapes needed, 485; escapes out of order, 227; obstructions to be removed, 89; stairways required, 45; doors to open outward, 14.

Lift Inspection.

Periodical inspection is made by the Elevator Division of 8,420 passenger lifts, with the result that about 1,000 breaches of the rules were reported during the year. No inspection is made of the 10,000 goods lifts in the borough. Unfortunately, lift accidents are not fully reported at present, but from a record attempted during the last five months of 1910 it seems ten passenger and four goods lift accidents occurred, with seven persons killed and fourteen injured. Six of these misadventures were due to defective ropes and machinery, and five to carelessness of passengers.

In consequence of an accident early in the year, when a number of persons were injured owing to the fracture of the sheave strap in the lift of a ten story building, a new regulation was issued demanding the reconstruction or strengthening of all such straps in use. This regulation has been rigorously enforced, and its wisdom is justified by the discovery that in sixteen cases the straps were found broken when the machinery was taken apart, and it was mere good fortune that more accidents had not occurred.

Brick, Cement, and Concrete Tests.

An important duty undertaken by the Bureau is the testing of materials in the form of bricks, in order to furnish data for the issue of regulations and the modification of the regulations already in force. The following table gives the average results of tests made by the Bureau up to the end of last year:

Kind of Brick or Blocks.	No. Tested	Modulus of Rupture lb. per sq. in.	Compressive Strength lb. per sq. in.		Absorption by Weight per cent.
			Dry	Wet.	
Clay (common)	59	169	3,959	2,702	15.00
Clay (pressed)	6	983	6,361	8,924	9.80
Cement 1: 4	5	475	4,394	2,594	10.67
Concrete (limestone) 1: 1.2: 2.4	7	895	4,189	2,537	
Concrete (trap) 1: 2.5	10	946	3,856	3,328	9.40
Clinker	12	946	4,716	3,678	3.70
Sand Lime	150	500	3. 78	3,094	12.34

OLD MATERIALS ON A BUILDING SITE.

FROM A LEGAL CONTRIBUTOR.

Who is entitled to the old materials on the site when new buildings or works of any other description are to be erected? This is a question which is often asked in practice, and it is important for the builder to know the correct answer. Sometimes, of course, the matter is provided for in the contract entered into between the parties; and to avoid the possibility of dispute it is always best to insert a clause dealing with old materials, for, in spite of a common belief to the contrary effect, it is clear law that an obligation upon a contractor to clear away old materials does not necessarily vest those materials in him. Again, where, by his contract, a contractor is bound to make an excavation, the material excavated does not necessarily become vested in him. On the contrary, if a contractor make use of materials thus supplied to him, the employer may set off their price against the amount due under the contract. For instance, in one case the plaintiff contracted to do certain work for the defendant, and to find the materials which the plaintiff made use of in the work. It was held that the defendant was entitled to deduct the value of the materials supplied by him from the contract price.

The importance (to the employer) of some clause dealing with old materials lies in the fact that, if nothing is said about them, the contractor may remove them. Having removed them, he may sell them. In that case, if he were to become bankrupt, the employer could not get the goods back, but would be relegated to his right of proving for their value in the contractor's bankruptcy. In these circumstances the architect should be careful to secure the insertion of an old material clause in the contract, by which his employer is to become bound. Where the contract for erecting a building or executing other works makes no reference to old materials, it seems that the contractor will be under an implied obligation to clear them away. In drawing his specification, the architect often inserts a clause to the following effect:—"Materials on the site to be used as far as possible." If a tender is made by a builder on the basis of such a specification, care should be taken to ascertain whether any deduction has been made in respect of old materials. If the builder, having made no deduction, makes use of any of the materials, the architect may set their value off against the contract price; and even if he has made a deduction, but has not informed the architect of the fact, there may still be a set off. For instance, in a case tried in 1867, the plaintiff, a builder, sued for the sum of 800l., the contract price payable on completion of the works. The architect had certified that the works were completed. The contract contained the following clause:—"All old lead to be displaced by new to become the property of the contractor, who will make a due allowance for same." The defendant employer pleaded a set off of 38l., the estimated value of old lead. It was held that, as the contractor could not prove that he informed the employer or the architect that, in making his estimate, he had allowed for the value of the old lead, the set off was good.

The following is a convenient form of old material clause:—"All materials upon the site

or upon the space to be covered by the contract works at the date of the contract, and all materials and things excavated by the contractor from the works, shall remain the property of the employer until paid for by the contractor. Such of them as shall be approved by the architect for the purpose of the works shall be paid for by the contractor at a price to be named in his tender or, if not named, to be ascertained by the architect, and all other materials shall be removed by the contractor from, or deposited, stacked, or spread on the site as where and when directed by the architect."

In cases where the contractor is not permitted to remove gravel, ballast, etc., the following clause is sometimes used:—

"The contractor shall not sell or otherwise dispose of, except by using the same for the purpose of the contract and the works to be constructed and erected thereunder, any sand, stone, gravel, clay soil, or other material, or substance of any kind or description whatsoever which may be obtained from excavations or found on the ground by the contractor."

BOILER EXPLOSIONS IN 1910.

From the recently issued Board of Trade Report it appears that the total number of boiler explosions and personal injuries resulting therefrom during last year were above the average for the past twenty-seven years. Two satisfactory points, however, are that the number of persons injured was little above the average, and that the number of fatal accidents was only about half the average. As the term "boiler explosion" covers mishaps in steam pipes, steam chests, steam cooking ovens, and all kinds of apparatus where steam is used, the number of accidents reported is no criterion as to boiler explosions proper, and we are glad to find that there is no increase in serious explosions. Of the 103 explosions reported, sixty happened on land and forty-three on ships. The causes of explosion, as given in Appendix B, were as follows:—

Deterioration or corrosion, 26; defective design or excessive pressure, 32; defective workmanship or materials, 16; water-hammer, 9; ignorance or neglect of attendants, 8; miscellaneous, 12.

The following is a classified list of the boilers and apparatus in which explosions occurred:—

Horizontal multitubular boilers, 16; locomotive-type boilers, 3; water-tube boilers, 9; vertical boilers, 6; Lancashire boilers, 2; tubes in steam ovens, 16; heating apparatus, 3; steam pipes, stop-valve chests, etc., 30; miscellaneous, 19.

In forty-six cases the boilers and apparatus were not subject to insurance or expert inspection, the latter being a safeguard which should always be adopted in connexion with steam generating plant. From the first classified list given above it will be seen that most of the accidents were due to preventable causes, and we hope that avoidable explosions may soon be obviated entirely. The valuable work of the Board of Trade in investigating all mishaps, whether serious or trivial, is certainly helping towards this desirable end.

PALMER'S TRAVELLING CRADLES AT THE ARMY AND NAVY STORES.

MANY of our readers are familiar with the bridge connecting the front and back buildings of the Army and Navy Stores in Victoria-street, Westminster, the structure in question being at such a distance above the intermediate street as to render it inaccessible by ordinary means for the purpose of exterior cleaning and painting. If ordinary scaffolding were employed, the cost of erection, with due provision for the conduct of vehicular and pedestrian traffic, would be quite disproportionate, as may be understood without much consideration. Thanks, however, to the suspended scaffold introduced by Palmer's Travelling Cradle and Scaffold Company, the difficulty has been readily surmounted in the case of this and various other large buildings in London and elsewhere.

The accompanying view shows two of the cradles suspended from overhead wire cables stretched between the two blocks of the Army and Navy Stores, enabling workmen to get

Palmer's Travelling Cradles at Work at the Army and Navy Stores.

at every part of the intercommunication bridge without the least trouble.

It is unnecessary for us to give particulars as to the details of the cradles, as these were fully stated in our article of March 10 last on "Scaffolds for Steel-Frame Buildings."

ASPHALT: SUPPLIES AND PREPARATION.

JOSEPHUS, in his antiquities of the Jews, states that Nimrod, the grandson of Noah, incited the people to build a tower "which was so great and strongly built that its great height seemed, on the view, to be less than it really was. It was built of burnt brick cemented together with mortar made from bitumen that it might not be liable to admit water. The place where they built the tower is called Babylon." Herodotus says that, in building the walls of Babylon, the clay dug out of the trenches, afterwards to form the moat, was made into bricks as soon as it was carried up, and burnt in kilns. When they had a sufficient number the bricks were cemented together with hot bitumen, and at every thirtieth row craters of reeds were inserted.

The bitumen was obtained from the River Is, a tributary of the Euphrates, and was brought to Babylon; lumps of bitumen being found in great abundance floating in the river.

Josephus explains that it was collected in ships by those whose trade it was, and, being difficult to pick up, vinegar was poured over it, which stiffened it. Once having started one end into the ship the rest followed and continued until the ship was full. The sailors then cut it to prevent any more entering.

As a steel or brass knife would not cut, they had to resort to another expedient. They smeared blood across the bitumen, which caused a break immediately, and the knife ceased.

In the alluvial plains of Assyria, both clay and bitumen were found, the bituminous cement bubbling out of the ground. It collected by the Arabs at the present day.

There are also very early evidences of the use of bitumen as a lining for cisterns and water tanks.

Mineral pitch, asphalt or asphaltum, in the Dead Sea, where it was also found in ancient times, is produced by the decomposition of animal and vegetable substances. Its colour it varies from a black to a blackish brown not unlike coal in appearance. Its general nature is therefore resinous with a s.g. of 1.5, and its chemical formula is $C_{18}H_{16}O$.

The lake at Trinidad having an area of about 99 acres is the most remarkable deposit being of unknown depth intersected by streams of water. It also occurs in the surrounding country in deposits of varying size and as old floats down the river or is cast upon the seashore. It also is to be found in various places in Europe, but not to any great extent, usually being found in greatest abundance in hot climates.

In Cuba, a very fine asphalt is found known as Mexican asphalt, and also a fine asphalt of pure variety comes from Peru.

Asphalt stone, a limestone impregnated with bitumen, occurs in various parts of Europe in large quantities, is of greater commercial value. The best known are those of the Val de Travers canton of Neuchâtel, Seyssel in France, and Limmer near the city of

and also at Hölle, in Ditmarchin
Schellbronn in Alsace.
Asphalt is sometimes improperly
denote the natural bitumen or pitch,
impregnated with bitumen, tar-
oil, or tar-concrete, a mixture of
broken stone, and coal-tar, and pitches
of artificially-mixed residuum oils
and naphtha, oil and animal
oil, and asphalt. But true asphalt
is a natural product, and may be
found as "calcareous rock impregnated
with bitumen." The manufacturers
heat lumps of rock, mined in the ordinary
manner, and reduce them to powder by means of
rollers, screened, reground, and stored
over. It is then heated in slowly-
revolving cylinders at a temperature varying
from 200° Fahr. to 280° Fahr., or at a slightly
higher temperature in colder weather. The
heat of coal or wood, as coke, for
example, injures the asphalt. The heating
is for a few hours, during which
the asphalt is taken to maintain a uniform
temperature because if it is underheated the
mass will not bind properly when laid,
and if over-heated it will fuse.

The heating has for its object the removal
of water, and to obtain the best binding
for heavy traffic the powdered form
of asphalt has proved to be the best. It is
then powdered in thicknesses
from 2 in. to 3 in. thick, raked
and rammed or tamped with hot
iron about 12 lb. weight, and whilst still
hot rolled with a 10-ton roller to
make the whole even.

THE STRIKES AND EMPLOYMENT.

figures published in the *Board of Trade
Gazette* furnish food for thought.
Now an improvement in employment as
compared with a year ago. The trade union
show 33 per cent. unemployed as
compared with 4 per cent. August, 1910.
So show a net increase in the results
of the strikes in the rate of wages of 9,400
men, and these are two signs much relied
on indicating a period of prosperity; yet,
this, the strike demon overshadows
all, and during the month 100 new
strikes were commenced, and the number of
men involved in current disputes was
over 184,507 more than in July, whilst
working days lost during this one month
were 323,800. Up to the end of July
working days had been lost, so the
total now reached 7,821,800 working days.
Whole year 1909 but 2,560,425 working
days were lost, although 1908 was a bad year
with 6,625,678 working days lost through
strikes. We have not the figures for 1910
yet, but the above statistics surely show
that the industrial nation can prosper when
the conditions of trade are squandered
in strikes days lost to this extent through
strikes. The 7,821,800 working
days lost in the eight months of this year
represent a loss in wages to the working
classes approximating 2,000,000.

GOVERNMENT CONTRACTS.

Following tenders have been accepted
the past month by the Government
contracts named:—*Admiralty, Works De-
partment*: Tar macadam for Dover Messrs.
J. & Co., 20, Tothill-street, S.W.; works
for floating booms, and gates Mr. J. J. T.
Alison Shipyard, Portsmouth;
detention quarters, Chatham Messrs.
J. & Beal, Ltd., 1, Arthur-street, East,
reinforced concrete jetty, Portsmouth—
H. Lovatt, Ltd., Darlington-street,
London. *War Office*: Works services—
of Amey, Somerset Barracks, Shorn-
cliffe, J. T. Denno, Walmer, Kent;

erection of barrack store, Army Ordnance Es-
tablishment, Burscough—Mr. G. L. Desoer,
Everton-road, Liverpool; erection of bomb-
proof shelter, engine-house, Pon Farm—Mr. J.
Crockerell, Bulford Camp; erection of canteen,
Dunree—Mr. R. Coulhoun, Londonderry;
erection of fire engine shed and vehicle shed,
Presno—Mr. R. Holt, Badger-street, Bury;
erection of stables for commanding officers,
Bordon—Messrs. Martin, Wells, & Co., Ltd.,
Victoria-road, Aldershot; new drainage works,
etc., Glen Parva Barracks, Leicester, and
erection of reception station, Strensall, Mr.
A. Robinson, Woodbine Works, Idle, Brad-
ford; periodical works services at:—Black-
down and Deepcut, Bulford Camp, Chatham,
Kildare, and Woolwich (2nd Division)—Mr.
F. Holdsworth, Shipley, Yorks; Dublin (Por-
tello and Richmond Barracks)—G. Morrow
& Sons, Clifton-street, Belfast; Millbank,
London—Mr. M. McCarthy, Heidelberg,
King's-avenue, Clapham Park, S.W.; Netley
Hospital—Messrs. G. F. Smith & Co., Eldon-
street, Southsea; Norwich and Winchester—
Messrs. Skevington Bros., Bateman street,
Derby; Warrington—Mr. D. E. Hutton, 7,
Briggat, Shipley; re-crowning and repair of
gas holder, Royal Gas Factory, Woolwich
Arsenal Messrs. Newton Chambers & Co.,
Ltd., Thorncliffe Ironworks, near Sheffield;
remetalling roads and parades, Ponsonby and
Stewart Barracks, Curragh, and renewal of
rough casting, Newbridge—Mr. T. O'Mahony,
Fernoy, co. Cork; renewal of stable paving,
Royal Pavilion Stables, etc., Aldershot—Mr.
J. Crockerell, Stanhope Lines, Aldershot;
repair and maintenance of War Department
buildings, Landguard Messrs. W. F. Blay,
Ltd., Belford-grove, Woolwich; supply and
erection of aeroplane shed, Doughty Down,
Salisbury—Mr. W. Harbrow, South Bermond-
sey Station, S.E. *India Office, Store Depart-
ment*: Bridgework—Messrs. Horsley Com-
pany, Horsley. *Crown Agents for the
Colonies*: Bridge—Messrs. Thames Iron-
works, Ltd., Canning Town, E. *Bridge-
work*—Messrs. The Horsley Company, Ltd.,
Tipton, Staffs.; cement—Messrs. Associated
Portland Cement Manufacturers, Ltd., 8,
Boyd's-avenue, E.C.; Messrs. Peters Bros.,
12, Victoria-street, S.W. *Messrs. Woulham
Cement Company, Ltd.* 35, Great St. Helen's,
E.C.; steelwork, etc. Messrs. William Bain
& Co., Ltd., Lochrin Ironworks, Coatbridge;
structural work—Messrs. The Horsley Com-
pany, Ltd., Tipton, Staffs. *Office of War-
like Buildings*: work—National Gallery of Scotland,
reinforced concrete roofs—Messrs. Scott, Mar-
shall, & Co., 2, St. Andrew's-square, Edin-
burgh; Somerset House, repository—Messrs.
Galbraith Bros., Ltd., Chamberwell Green,
S.E.; drainage, Babney House—Messrs. Dent
& Hellyer, 35, Red Lion-square, W.C.;
Chelsea Hospital—Messrs. John Peattie &
Son, 3, Victoria-grove, Kensington, W.; forced
circulation heating apparatus, Windsor Castle,
Royal Gardens—Messrs. Mackenzie & Moncur,
Ltd., Balcanes-street, Edinburgh; heating
services, British Museum extension—Messrs.
The Brightside Foundry and Engineering
Company, Ltd., 28, Victoria-street, S.W.;
National Gallery, west wing, and Patent
Office extension—Messrs. Cammell & Heford,
Stanbury-road, Peckham, S.E.; hot-water
service, Imperial College of Science—Messrs.
The Brightside Foundry and Engineering
Company, Ltd., 28, Victoria street, S.W. *General
Post Office, Engineering Department*:
Electric lifts, West Central District Office,
London, W.C.—Messrs. Medwards Safety Lift
Company, Rolt-street, Deptford, S.E. *Metro-
politan Police*: Carrying out alterations at
Kennington-lane Section House—Messrs.
Prestige & Co. Ltd., Cambridge Wharf,
Grosvenor-road, S.W.; erection of new station
and stables at Plaistow—Messrs. E. Lawrence
& Sons, Ltd., 35, Wharf-road, City-road, N.

GENERAL BUILDING NEWS.

CONGREGATIONAL CHURCH, KINGSWOOD.

The various alterations and additions to
this church have been carried out from the
designs of Messrs. La Trobe & Weston, archi-
tects, of Bristol. The contract has been
carried out by Messrs. Palser & Newton,
builders, of Bath.

NEW CHURCH, PLYMOUTH.

The new church of St. Mary the Virgin is
being erected at a cost of about 10,000l., from
the designs of Mr. T. R. Kitsell, architect.
The builders are Messrs. Pethick Bros.

ST. JOHN'S CHURCH, CANNONBURY.

A new reredos and some carved panelling
have been placed in this church at a cost
of about 250l., and the panelling was executed
in Austrian oak by Mr. A. Robinson, of
Bloombury. Various other improvements
have been carried out, including the remodel-
ling of the electric-light installation. The

architect for the work was Mr. J. C. Stock-
dale, of Bloomsbury.

NEW HIGH SCHOOL, WELLINGBOROUGH.

This school for girls has been erected from
plans prepared by Messrs. Sharnham &
Archer, architects, of Wellingborough, and the
builders were Messrs. Hacksley Bros. The sub-
contractors were:—Messrs. Hargis & Sons
(stone work), Mr. Jayes (plastering), Mr.
Crisp (plumbing, painting, and glazing), Mr.
Mansell, Northampton (electric lighting). The
hot-water apparatus, Messrs. Marriott & Co.

NEW SCHOOL, RHYOL.

This school has been erected at a cost of
about 13,356l. from the designs of Mr. W.
Rushworth, architect, and provides accommo-
dation for 207 scholars. The contract was
carried out by Mr. W. B. Cooper, of Sunder-
land.

GRAMMAR SCHOOL, WOLINGHAM.

This new school has been erected at a cost
of 11,537l., and provides accommodation for
about 150 scholars, with an assembly hall, hold-
ing 200 persons. The architect was Mr. W. T.
Richardson, M.S.A., of Stockton-on-Tees, and
the contract was carried out by Mr. T. Hilton,
builder, of Bishop Auckland.

NEW SCHOOL, TEWLSBURY.

The estimated cost of the erection of this
school is about 1,800l., and the work has been
carried out by Messrs. Collins & Godfrey,
builders. The architect was Mr. R. S.
Phillips, of Gloucester.

NEW SCHOOL, UFFERMILL.

With reference to the short paragraph under
this heading in our last week's issue (page
310), an error was made in giving the name
of Mr. Graham as the county architect. The
plans for this school were prepared by Mr.
John Stuart, the county education architect,
and the work carried out under his supervision.
Mr. Graham was the contractor for the works,
and the clerk of works was Mr. H. Schofield.

LOWESTOFT PAROCHIAL HALL.

A new Parochial Hall is being erected at
Lowestoft in Alexandra-road. The contract
for the building of the institute was 4,000l.
Messrs. Mobbs Bros. have been entrusted with
the building contract, the architect being Mr.
H. C. W. Blyth, Lowestoft. St. Margaret's
Parish Institute is designed in the late Gothic
style, with a façade of red brick and bath-
stone dressings. It consists of a hall on the
first floor, 60 ft. by 30 ft. There are seven
class-rooms opening on each side, with a plat-
form at the end, retiring rooms, and lavatories.
On the ground floor are the institute rooms,
billiard-room, reading-room, a small hall 36 ft.
by 24 ft., choir practice-rooms, kitchen, guild
and class-rooms, and a crush hall. It is a
two-story building.

HALL, ST. ANDREW'S.

A large hall has been built for the quin-
centenary celebrations at St. Andrew's
University, by Messrs. D. Meandrew & Co.,
builders and contractors, Aberdeen. The hall
is situated on the tennis courts behind the
United College, and measures 225 ft. long by
50 ft. wide, and is seated for 3,500 people.
The hall is roofed in three bays, the central
bay having a span 50 ft. wide by 24 ft. high
to the underside of the tie, and two parallel
side bays each 20 ft. wide by 17 ft. high to
underside of tie. At the west end of the hall
the platform extends across the full width of
90 ft., and is 20 ft. wide, approached by three
sets of stairs from the main level of the floor
and with two exit doors leading from a plat-
form to a corridor behind. At the east end
of the hall there has been formed a band
gallery, with a floor area 30 ft. by 16 ft.,
approached by a separate stair outside. A
corridor 6 ft. wide extends from the east
door the full length of the hall, terminating
with a flight of steps to the platform. At the
quadrangle entrance a cloak-room has been
fitted up for 750 guests, and also a robing-
room, 40 ft. by 20 ft. At the Scores entrance
a cloak-room has been fitted up for 500 guests,
and for the guests entering from North-street
cloak-rooms have been formed in the Physics
Laboratory and the Chemical Laboratory.
The hall and corridors are lighted by
electricity.

TRADE NEWS.

Under the direction of Mr. S. Clifford Tee,
architect, 50, Moorgate-street, E.C., Boyle's
latest patent "air-pump" ventilators and air
inlets have been applied to the new Synagogue,
Harringay, N.

Kent-street School, Portsea, has recently
been fitted with a number of D. O. Boyd's
hygienic ventilating school grates, supplied by
Messrs. O'Brien, Thomas, & Co., Upper
Thames-street, London, E.C., and Excelsior
Works, South Bermondsey.

In reference to the illustration which
appeared in our issue for September 8, the fire-
places throughout the new building for the

King Edward Memorial Hospital, Ealing, were supplied by the Well Fire & Foundry Company, of Berners street, W.

Messrs. The Tilbury Contracting & Dredging Company, Ltd., of Westminster, have been successful in securing a contract for the supply of some 200,000 cubic feet of freestone from their Walldan Quarries. This stone is required for the construction of buildings at the Naval Base, Rosyth, among which are the Pumping Station, the Power Station, the sub-Electric Station, and the Boat House.

The new electric theatre, Bournbrook, Birmingham, is being supplied with Shorland's patent exhaust roof ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Fails-wharf, Manchester.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Baths (10,500l.). Mr. W. Dyack, Surveyor, Town-buildings, Aberdeen.

Aberford (Yorkshire).—Chapel (4,000l.). Mr. H. A. Chapman, Prudential-buildings, Leeds.

Alfredshot.—Drill hall; Mr. W. J. Snugg, builder, Birchett-road, Aldershot.

Arbroath.—Proposed reconstruction of infirmary (3,000l.); the Directors.

Banbury.—Offices and additions to mills. Station-road, for Messrs. Clarke, Ltd.

Barry.—Training college for women (36,000l.). Messrs. Tether & Wilson, architects, Queen-street, Cardiff. Messrs. W. Thomas & Co., builders, Tressilian terrace, Cardiff.

Broadford (Skeg).—McKinnon Memorial Hospital (3,000l.). Mr. W. L. Carruthers, architect, 22, Queensgate, Inverness.

Buckhurst (near Hatfield, Sussex).—Residence; Messrs. Tubbs & Messer, architects, Railway-approach, Woking; Messrs. Drowley Bros., builders, Woking.

Cardiff.—Offices, Queen-street, for the Principality Building Society; Messrs. Habershon, Fawcett, & Co., architects, 14, Pearl-street, South, Cardiff.

Cardinal (Renfrewshire).—Four cottages, Lennox and Westfield roads; Mr. John Young, Lennox-road, Cardonald.

Chester-on.—Pavilion, Milton-road, for the Marglens College Amalgamated Clubs. Extensions to works, Camford-street, for the Cambridge Scientific Instrument Company. Extensions to works, Garden-walk, for Messrs. Pollard & Co.

Clydebank.—Church; architect, care of the Trustees, Morrison Memorial Church.

Coatbridge.—Additional premises for the Coatbridge Co-operative Society.

Coloraine.—Sixty-six houses (11,300l.). Mr. S. J. M'Fadden, architect, care of the Clerk, Coleraine Rural District Council.

Countess Wear.—Farm buildings (4,000l.). Messrs. E. H. Harbottle & Son, County-chambers, Exeter.

Crewe.—Chapel (5,000l.), in connexion with the convent in Nantwich road.

Cwmbrwla (Swansea).—Proposed school; Mr. A. W. Halden, Secretary, Education Committee, Swansea Town Council. Three houses, Middle-road; Messrs. J. & F. Weaver, builders, Manselton Steam Joinery Works, Cardiff.

Dean Bank (Durham).—New church; Mr. J. R. Grossart, Durham-road, Finden hill, Sacriston, Durham.

Downfield School (4,000l.). Mr. R. S. Phillips, architect, The Cross, Gloucester.

Dublin.—Repairs to baths and wash-houses, Tara-street; Mr. C. J. McCarthy, Architect, Dublin Corporation.

Dunfermline. Laundry. Secretary, Dunfermline and West Fire Laundry, Ltd., 143, High-street, Dunfermline.

Earsdon.—Picture theatre; Mr. R. T. Whitebarn, Whitley Bay, Northumberland.

Eccles.—Extensions to Eccles and Patricroft Hospital (5,660l.). Messrs. Hardman & Jones, builders, Devonshire road, Eccles.

Edinburgh.—Nursing home, Chalmers-street (11,000l.); Mr. T. Duncan Rhind, architect, 28, Rutland-street, Edinburgh. Ice rink, Haymarket, for Messrs. John Swan & Sons.

Exmouth.—Police buildings (5,000l.). Messrs. Harbottle, architects, Queen-street, Exeter.

Gillingham (Dorset).—Swimming bath; Mr. W. J. M. Marriish, Wyke-road, Gillingham.

Gillingham (Kent).—Alterations to club and institute, Balmoral-road, for A. S. E. Club, Gillingham.

Glasgow.—Extensions to glass warehouse, Waterloo-street (2,500l.). Mr. John B. Wilson, architect, 82, Bath-street, Glasgow.

Govan.—Workshops for the London and Glasgow Shipbuilding Company.

Great Whyte (Hunts).—Four houses; Mr. A. J. Bateman, builder, High-street, Ramsey, Hunts.

* See also our list of Competitions, Contracts, etc., on another page

Gwaclodywain.—Proposed school; Mr. T. G. Jones, Secretary, Education Committee, Monmouthshire County Council, Newport.

Halifax. Conversion of premises, corner of Commercial street and Cheapside, for the Bradford and District Banking Company.

Hayes.—Offices, etc., for the Gramophone Company.

Hebburn. Officers and workshops, Messrs. Hawthorn, Leslie, & Co.'s shipyard; Messrs. Boyd & Groves, architects, Emerson-chambers, Blackett street. Newcastle-on-Tyne; Messrs. Lowry & Sons, builders, Newcastle-on-Tyne.

Hednesford (Staffs).—Technical institute; Messrs. H. Dorrie & Son, builders, King-street, Cradley Heath, Staffs.

High Springwell (Durham).—Villa (1,000l.); Mr. H. T. Gradon, architect, 22, Market-place, Durham.

Ilkeston.—School, Bennerley-street; Mr. H. T. Sudbury, architect, 35, Lord Haddon-road, Ilkeston.

Kirkmichael (Perthshire).—Extensions to school (2,200l.); Mr. Lake Falconer, architect, 27, Union Bank buildings, Blairgowrie.

Leirdale.—Additions to public school (1,800l.); Architect, care of the Kirkintilloch School Board.

Leigh.—Police officers' quarters; Mr. P. J. Sheldon, Surveyor, Essex County Council, Chelmsford.

Leominster.—Chapel, etc., at cemetery, Hereford road; Messrs. Turford & Southwell, builders, Ludlow.

Liverpool.—Additions to Parkhill Hospital (1,050l.); Mr. J. P. Alexander, City Building Surveyor, Liverpool Town Council.

Lowestoft.—The following plans have been passed:—Mr. C. E. Chitoph, four houses, Carlton-road; Trustees of Beaconfield Club, Club House, Surrey street.

Lurgan. Fifty houses; Surveyor, Lurgan Urban District Council. (Architect to be appointed.)

Lytham.—Institute in connexion with St. Peter's Roman Catholic Church, Lytham.

Maesteg (Glam.). Proposed Council offices; Mr. S. J. Harpur, Surveyor, Maesteg Urban District Council.

Mallaig.—Extensions to public school (2,105l.); Mr. James Falconer, architect, 4, Cameron square, Fort William.

Mansfield. Woodhouse. Adaptation of Wesleyan chapel and schools for public offices; Mr. F. P. Cook, Surveyor, Mansfield Woodhouse Urban District Council.

Mexborough.—Public baths (5,000l.); Mr. G. F. Carter, Rural District Council Offices, Mexborough.

Muirrow. School (5,000l.); Mr. Ralph Little, architect, 15, Ribblesdale place, Preston.

Monkerton Pinhoe. Extensions to farm house, also new farmhouse and six cottages; Messrs. Ellis, Son, & Bowden, Bedford chambers, Exeter.

Morton (Durham). Proposed house on Knarborough Estate; Mr. G. Waterhouse, Surveyor, Eastington Rural District Council.

Newcastle-on-Tyne.—Building, Market street; Messrs. Anderson, Sons, & Hedley, auctioneers, Market street, Newcastle-on-Tyne.

Newlands (Renfrewshire).—Nineteen cottages, Auldhouse-road; Mr. John Baxter, Woodhead-avenue, Kirkintilloch.

New Mills.—Shed for Messrs. Crowther, Bruce, & Co., Ltd.

Newport and Bedwellty (Mon.).—Police stations (3,600l. and 2,800l.); Mr. W. Tanner, Surveyor, County Hall, Newport, Mon.

Newtownards.—Reconstruction of post office; Messrs. J. A. Gordon & Sons, builders, Ann-street, Scrabo, Newtownards.

North Seaton, Throckley, and Emblethorpe.—Schools (2,600l., 7,000l., and 2,800l.); Mr. W. Crozier, County Surveyor, Shire Hall, Durham.

Paignton (Devon).—Alterations to school, Curledge-street (750l.); Mr. H. Drew, builder, care of Mr. J. F. Young, Secretary, Education Committee, Devon County Council, Exeter.

Paisley.—Additions to offices and stores, Hawkhead-road, for Messrs. Doultou & Co., Ltd.

Pengam (Mon.).—School (7,125l.); Mr. R. Jones, builder, Caerphilly.

Portadown.—Proposed eighty houses; Surveyor, Portadown Urban District Council.

Portsmouth.—Extensions to public school; Mr. John Wittet, architect, 81, High-street, Elgin, N.B.

Prestwood.—Extensions to car depot (3,400l.); Mr. H. F. Street, Electrical Engineer, Southampton Town Council.

Princes End (Tipton).—School; Mr. E. Richards, Secretary, Education Committee, Tipton Urban District Council.

Rugby.—Enlargement of St. Marie's Schools (700l.); Mr. Rourke, builder, Lutterworth.

Scarborough.—Proposed extensions to the sanatorium (600l.); Mr. P. H. Reed, Clerk, Board of Guardians, Scarborough.

Seaham Harbour (Durham).—Enlargement of school (500 additional places); Mr. J. A. L. Robson and A. J. Dawson, Secretaries, Education Committee, County Council, Durham.

Silksworth (Durham).—Enlargement of school (150 extra places); Messrs. J. Robson and A. J. Dawson, Joint Secs., Education Committee, Durham Council, Durham.

Southampton.—Shelter, convenient, Hollybrook Cemetery (475l.); Mr. R. Crowther, Borough Engineer, Southampton Council, Residence, 9, Park Bassett; Messrs. Potter & Warren, architect, Church-street, Yeovil.

Southchurch.—Police officers' quarters; Mr. J. Sheldon, Surveyor, Essex Council, Chelmsford.

Southend.—Parish hall (250 places), in connexion with St. Helen's Roman Church, Southend.

Southport.—Catholic school; Mr. Gilbertson, architect, 13, Harrington, Liverpool.

Stafford.—Proposed engineering works; Messrs. W. H. Dorman & Co., Ltd.

Staveley.—School, corner of Eckington Barrow Hill roads; Mr. E. W. Small, Surveyor, Education Committee, Derbyshire Council, Derby.

Stockport.—Police station and (30,000l.); Mr. J. Theo. Halliday and Peterson, architects, Manchester and port. Extensions to hospital, Dalston (ward); Mr. W. B. Beattie, builder, well-street, Stockport.

Stoney Stanton.—Additions to premises the Stoney Stanton Co-operative Society, Sunderland.—Premises for Messrs. C. Speeding Bros.

Swansea.—The following plans have passed:—Messrs. J. & F. Weaver, houses, Middle-road, Cwmbrwla; Mr. J. Williams, three houses, Mansel-road; Mr. David Symmons, twelve houses, Plasmyd; Mr. Hyman, additions to Olympic Skating Rink, Oxford.

Mr. David Thomas, eight houses, street; Mr. James Taylor, seven Monty-street; Messrs. J. B. Jenkins & four houses, Bernard-street; the Sec Education Committee, Swansea Town Council, additions to St. Thomas's School; Mr. Brown, six houses, Jersey-terrace; Charles Gustavus, three houses and High-street; Mr. William Coutts, bi hall, High-street; Messrs. Thorne & C. Williams, Cambrian-place. The following plans have been lodged: Mr. W. J. H. five houses, Spencer-street, Brynhyfryd; Hopkin Williams, ten houses, Mansel Chapel Trustees, proposed additional chapel, Sydney-street, Brynhyfryd; Mr. Thomas, four houses, Pentrechrystall; Tranent, School (5,000l.); Mr. P. J. cross, architect, Prestonpans.

Tredegar (Mon.).—Proposed swimming baths; Mr. W. L. Roach, Surveyor, Tre Urban District Council.

Treorchy.—Congregational school and schools (3,000l.); Mr. W. Beadon, architect, 3, Dunfries-street, Cardiff.

Turton.—Additions to Vale Mill, Edgworth Spinning Company, Ltd.

Twickenham.—The following plans have been lodged:—The Estate Land and H. Ltd., cinematograph theatre, Richmond.

Mr. F. J. Fisher, additions to "Head" public-house, Albion-road.

Utteter.—Remodelling the Smith (2,562l.); Mr. M. A. Boswell, builder, Hampton.

Valleyfield.—One hundred and nine houses for the Fire Coal Company.

Walsall. The following plans have passed: The Managers, additions to St. John-street; Mr. S. Wilkes, additions to Bullocks Fold, Bloxwich; Walsall Co-operative Society, Ltd., shop, etc., Wednesbury Pile.

Wells.—Extensions to Wells Blue (2,000l.); Mr. J. A. Pictou, architect, B. Somerset; Mr. S. Wikham, builder, L. water.

Whittle-le-Woods.—Institute; Architect of the Vicar, St. John's Church, Whittle Woods.

Willington.—Twenty houses; Mr. J. Armstrong, builder, care of Willington Co-operative Society, Willington.

Winchcombe (Gloucester).—Addition to workhouse; Mr. H. W. Stephens, Clerk, of Guardians, Winchcombe.

Wokingham.—Proposed public baths; Mr. W. Marks, Surveyor, Wokingham Council.

Wolverhampton.—Additions to electricity generating station (6,000l.); Messrs. J. C. Sons, builders, Wolverhampton.

Yoker (Renfrewshire).—Church and rooms, Harvey-street, for the Kirk Session the Yoker Parish Church.

Residence, Dunedin, New Zealand.

Mr. Basil B. Hooper, A.R.I.B.A., Architect.

This residence is on a site only 35 ft. frontage, which, of course, materially influenced the plan. The walls are in hollow brick, rough cast, and the roof is covered with green American slates.

THE MISUSE OF STONE.

It is wrong to condemn a stone which has been used in a particular case without further inquiry into the circumstances of its use. In the case of building stones of untested reputation, it is a mistake to assume that one stone is as good as another for all uses, and nothing has done more to injure the reputation of certain kinds of stone than the indiscriminate way in which they have been employed. In the selection of building stone too much importance is often laid upon such considerations as fashion, price, convenience, or cheapness, to the neglect of the particular conditions to which stone is to be used and its suitability for the purpose in view.

In this respect specifications often leave much to be desired in clearness and precision of terms employed. For example, Portland stone may be specified without distinction as to bed, although, as is well known, the bed and basebed have very different qualities, the former being more durable for work in large cities than the latter, and, in the absence of restrictions, the user may for various reasons prefer to use locally Bath stone, also, without defining quarry and even the bed from which it is taken is equally objectionable. The liability of stone is so great that general statements often mean very little, and loose specifications may be taken to be a fertile source of the misuse to which stone is sometimes put.

The use of various kinds of marble for ornamental work in cities and manufacturing districts is another example of the need of discrimination, not only as regards the marble, but also as to the locality in which it is used. Experience is quite adverse to the indiscriminate use of this material. Marble was very fashionable in New York in the early half of last century, but few have

proved capable of resisting atmospheric action for any length of time. Some of the monuments in that city, constructed of Vermont marble, are now covered with moss and lichen. In London, notwithstanding some sad experiences, such, for example, as the front of the Tivoli Music Hall in the Strand, marble façades are still erected, and some excellent examples from Greek and Italian quarries have lately been built, while in Liverpool the experiment has been also tried, the results of which time will show. In some Continental cities, where the air is dry and clean, marble structures are more durable, and striking effects are obtained by its use when properly selected. Of this there are many examples, of which mention may be made of the beautiful white marble from Ekeberg, in Narke, used in Stockholm. It seems to be clearly established that only perfectly homogeneous marbles have any chance of withstanding the action of town atmospheres, and these must be of a compact, non-absorptive character. The pure white kinds, however, are generally more granular and softer than the blue and grey varieties.

The presence of other minerals than pure calcite or dolomite has generally proved disadvantageous. Tremolite marble has been tried in New York with bad results, the tremolite veins weathering out and disfiguring the stone by ugly fissures. Seams of talc have behaved similarly in the marble statues of Lincoln in front of the City Hall, Washington. Breccia marbles and coloured varieties, such as Verde Antico, are liable to unequal weathering, and have not proved satisfactory for external use in an impure atmosphere.

A frequent cause of failure in building stone is the selection of too soft a material. Ease of dressing and working are too often the main inducements in such cases. Examples are innumerable. An instructive case is the failure of the soft Darley sandstone in various public buildings in Melbourne. For this

reason this stone was rejected in favour of the harder and more compact white Stawell sandstone for the new Houses of Parliament in that city.

Bad Results Due to Careless Quarrying.

However carefully a particular kind of stone may be selected, the material supplied is not always in accordance with requirements. It was stated before the Committee appointed to inquire into the cause of the decay of the stone used for the Houses of Parliament that the stone supplied was quarried indiscriminately from all the beds in the quarry face. Instead of following the best beds horizontally, the whole of the quarry was worked from top to bottom, and, although some softer beds were stated to have been rejected, there were noticeable differences in the nature of the stone delivered, which was determined rather by the size of the blocks than by their quality. The stone, moreover, was used without seasoning, and, even in the winter, was placed in position within a fortnight after being quarried.

Careless quarrying can also affect the soundness of the stone, and the mischief thus caused may easily escape notice. The "ring" of a stone can be rendered dull by the use of explosives, showing that incipient flaws have been developed. No stone with obvious flaws or blemishes should be used in construction, but unfortunately these are sometimes concealed. Thus we have examples of Belgian marble in which clay veins have been raked out and filled with stopping. The failure of such stone, which is sure to take place sooner or later, is a condemnation not of the stone, but of the way in which it has been misused. In South African buildings there has been much carelessness in respect of the use of unsound stone, resulting in bad fronts, cracked sills and lintels, and gaping fissures, arising from the want of any supervision over the despatch from the quarry.

rendered conspicuous by the action of

the case of certain marbles, which are highly metamorphosed that all bedding planes are obliterated, it is possible that harm may be done by setting on edge, where mica foliation is present such a is likely to prove disastrous, as was the with some of the older beds of Pentelicon from which the ancient Greeks cut obliquely to the mica layers, with a loss of strength, while columns cut the micaceous Bunter sandstone of the Forest without regard to this have failed conspicuously from this. Even crystalline rocks, such as with pronounced mica foliation, have badly in New York when set on edge. On the other hand, Merrill has examined buildings in which Cockeysville marble set on edge without evil results to its extreme uniformity in texture in direction.*

the weight has to be carried the of oblique lamination produces glide which are especially to be avoided in covered structures not exposed to the of flaking by frost.

matter is further complicated when current bedding is present. It is then impossible to avoid the existence of planes. For example, in the New Red one of Scotland it is not uncommon to rent bedding at angles as high as forty true bedding; but the bad effect in cases may be almost negligible in a well-bedded rock, as may be seen in Nuremberg. Much current bedded material has been. Similarly, a pronounced current bed appears on weathering in some of the white sandstones used in Melbourne—the Stowell stone and Dunkeld stone. In any serious ill-effects; but the Table in sandstone, of Silurian age, used locally in Cape Town, splits badly in directions owing to this cause.

ough, as a general principle, all should be set with the natural bed peculiar to the pressure—that is, in most with the bedding planes in a horizontal—there are occasions when these should be vertical. Thus, in overhanging under- surfaces, or in projecting string courses, bedding planes should be vertical and run front to back, i.e., at right angles to the building, in order to avoid the risk of flaking. The same applies to copings and positions in which stones are exposed upper and under surfaces and carry the weight. Gothic tracery, also, is any more durable if face-bedded, because the planes are in so many directions that this is the only way to prevent the planes of bedding from crossing the points and causing them in time to split off. In arches the bedding planes should be at right angles to the direction of thrust. The practice of edge-bedding in order to show the pattern sometimes adopted on the bedding-planes, as in the some Connecticut brown stones, is not recommended, and has generally led to deterioration owing to flaking. The objectionable practice is to dress with a hollow bed in order to secure pointing. The result is that the weight is carried solely on the edges, instead of distributed over the whole bed, and is then liable to take place. Similar cases have been followed in the case of granite, with the result that even granite have cracked under the load upon them. The case of Holborn Viaduct have been as a striking example of this mistake.

Effects Due to Embedded Metal.

Fracture of stone by included iron has frequently been described. This effect has recently studied in detail by M. G. who has examined many cases in which stone posts have been broken by fixing iron rails, cramps, dowels, etc. He has attributed these fractures to the following

3. Fracture by frost, owing to infiltration of water into badly sealed iron fixing.
4. Fracture, owing to badly-worked holes to receive metal fixings.
5. Fracture by expansion, due to rusting of included iron.

To avoid these results, he recommends that only pure lead should be used for sealing. Portland cement and sulphur should be avoided. Iron is bad for cramps and dowels, owing to the effects of oxidation, which not only causes staining, but also results in expansion and splitting of the stone. Galvanised-iron is better than ordinary iron, and bronze is better than either. For fixing marble slabs copper cramps should always be used.

Errors Due to Position.

Certain parts of a building are especially susceptible to atmospheric disintegration. Staining is often the result of water running down a wall owing to bad construction. Atmospheric action often begins in masonry beneath cornices and projections. For this reason all cornices, sills, and projections should be "weathered," that is, inclined so that water runs off, and the softer the stone the steeper should be the inclination, reaching in extreme cases to one in ten. Otherwise the top should be covered with sheet lead.

The undersurface of projections should be "throated" to prevent water from running back to the wall. Inattention to these details has often led to speedy disfigurement of a façade.

Special conditions are also worthy of notice, such as may be observed in the doorway of the exit from the Central Low Level Station, Hope-street, Glasgow, which is in the path of the acid-laden air from the railway, and has suffered marked disintegration. In damp situations walls should not be built with porous stone. Hollow walls are an advantage in such cases. Neglect of this precaution has been a fruitful source of disintegration of buildings in Egypt, in a climate particularly favourable to durability. Mr. A. Lucas has called attention to the serious decay in buildings near the ground level in Cairo, owing to absorption of saline ground water, which on evaporation from the surface of the stone leaves a deposit of salts, not only as an efflorescence on the surface, but also within the pores of the stone, and leads to flaking owing to the expansive force of crystallisation.* An efficient dampcourse is a remedy in such cases, but in engineering work, such as bridges exposed to a fluctuating

December, 1910.

water level, the use of non-porous stone is essential.

In some climates damp situations may cause decay even when salts are absent, owing to the influence of frost. Thus in hydraulic works the neighbourhood of the waterline is generally the first part to show decay in countries where the temperature falls below freezing-point.

Damp walls may produce still more insidious effects. Thus marble slabs have been ruined by fixing them against newly-built walls. The surface becomes pitted with small holes, especially when the stone is face-bedded. It is advisable never to fix marble slabs solidly to the wall, but to leave an intervening air space. Even a backing of green wood has led to staining from absorption of sap by the marble.

Instances could be multiplied indefinitely, but the above examples are enough to show how the wearing properties of stone may be injured by misuse.

ARCHITECTURE AND SCULPTURE AT SOUTH KENSINGTON

SIR CECIL SMITH'S report, issued by the Board of Education, contains some interesting references to recent acquisitions for the Victoria and Albert Museum. The increased valuation placed on all works of art in recent years makes more than ever welcome such bequests as those by George Salting and Captain Murray. Special thanks are due to Mr. Fitzhenry for contributing to the permanent features of the "Department of Architecture and Sculpture," as it is now called. In 1905 he presented a handsome wooden staircase from a house at Morlaix, in Brittany; it is French work of about 1500. This fine stair, which must have stood in the corner of a courtyard, is spiral in form, and has galleries and landings for three floors. The principal feature is a tall column, elaborately carved with figures, shields, leafwork, and imbricated ornament, and surmounted by a statuette of St. John the Baptist; the balustrades springing from this column have linen-fold panelling. This interesting type of staircase is apparently peculiar to the town of Morlaix. Mr. Fitzhenry presented also a wall-head of orange-coloured marble, dating from the first half of the XVth century, bearing on one of the sides the arms of the Concoreggio family of Verona, and a XVth-century Venetian sarcophagus of carved limestone, said to have come from the church of St. Giobbe, at Venice. Three XVIIIth-century marble fireplaces were presented by Mr. J. A. Dolmage. In 1910 a series of doorways and other architectural details, mainly in wood, were presented by H.M. Office of Works; these date from the XVIIIth century—mainly from the last quarter—and were obtained from houses demolished in the early part of the year in Great George street and Delahay street. The gift is particularly acceptable, as doorways of this class are perhaps more continually measured and studied by architectural students than any other exhibits in the department. Mr. J. H. Fitzhenry presented an interesting relief of the Virgin and Child in painted stucco, the work of a Florentine artist of the first half of the XVth century. Other work by cognate sculptors, sometimes gathered together under the name of the "Master of the Pellegrini Chapel," is already exhibited in the Museum; but this relief (of which there is a replica in the Kaiser-Friedrich Museum at Berlin) is an example of a particular group hitherto unrepresented. Mr. Fitzhenry has further presented a collection of architectural details, mainly classical Roman work, in stone and terra-cotta, but including Romanesque capitals, etc. Another gift was that of three Japanese architectural models—the Beltry of the Todaiji at Nara, the Tah-tô (great pagoda) at Daidenbo-in, and the Hi-un-kaku (pavilion) at the Nishi Hongwanji, Kyoto, presented by Mr. H. Yamawaki on behalf of the Imperial Commissioners of the Japan-British Exhibition.

The Salting Bequest.

The magnificent bequest made by the late Mr. George Salting enriched the department in several directions; by far the most important, both absolutely and in relation to the collections previously possessed by the Museum, being that of Italian bronzes. The

bronzes in the Salting Bequest (altogether about 120) do not, indeed, put the Victoria and Albert Museum on a level numerically with some of the great collections on the Continent; but many of the new acquisitions are of the finest possible quality, and almost all are of unimpeachable authenticity. Perhaps the first place in historic importance and artistic merit would be taken by the bronzes of the Paduan school, which are grouped round the name of Andrea Briosco (1470-1532) better known as Riccio. The Paduan workshops produced a very great number of bronzes, especially decorative objects, and the name of Riccio must often be taken rather as indicating a place and period than a single artistic personality. But the two magnificent sphinxes, replicas of those at the lower angles of the great Paschal candlestick in St. Antonio at Padua, may be ascribed with confidence to the master's own hand. Another school of bronze-workers well represented in the bequest is the Florentine. The influence of Donatello himself may be traced in the beautiful little bell, decorated in low relief with a band of dancing children and surmounted by a boy beating a tambourine for a handle, though it must have been made after the master's death in 1466. Bertoldo di Giovanni, the pupil of Donatello and master of Michelangelo, who died in 1491, was very probably the maker of the large Hercules, with which may be compared another smaller figure of the same deity slaying the Nemean lion, and perhaps the curious circular plaque with an allegorical relief of architecture. The group of Adonis and his dog has been assigned to the school of Andrea del Verrocchio; the Moses (2625) is an almost contemporary copy of the colossal marble statue by Michelangelo which forms part of the unfinished tomb of Pope Julius II. in St. Pietro in Vincoli at Rome. The most important works by Giovanni da Bologna (1529-1608), who may be reckoned among Florentine artists, although born at Douai in French Flanders, are the group of Nessus and Deianira, the fountain-figure of Venus, and the large Rape of a Sabine woman, the latter one of the finest bronzes in the collection, and one of the first which Mr. Salting acquired. The Venetian and other North Italian schools are mainly shown in small figures and decorative objects, such as a singularly graceful candlestick ascribed to Leon. Leoni (1509-1580), an inkstand with a kneeling warrior, and a small six-sided fountain.

The medals and plaquettes in the Salting Bequest have been grouped with the bronzes in the Department of Architecture and Sculpture for purposes of arrangement. The medals form a carefully-selected series of about 250, generally in fine condition, and are a most valuable addition to the specimens already in the Museum. Among the Italian medallists Antonio Pisano of Verona, better known as Pisanello, is represented by six medals:—Leonello d'Este, Lodovico Gonzaga, Sigismondo Pandolfo Malatesta, Malatesta Novello, John Paleologus, and Niccolò Piccinino. By Matteo de' Pasti, also of Verona, are four medals:—Leon Battista Alberti, Sigismondo Pandolfo Malatesta, and two of Isotta Atti, his wife. Six medals bear the signature of Sperandio, the great medallist of Mantua:—Andrea Barbazza, Giovanni Bentivoglio II. of Bologna, Lodovico Brugnoli, Lodovico Carbone, Federico Montefeltro, Duke of Urbino, and Francesco Sforza. The portrait of the famous Sultan and conqueror of Constantinople, Mahomet II., is given on three medals, by Bertoldo di Giovanni, Costanzo, and Gentile Bellini. The medal by the first-named is one of the finest specimens in the collection, and is in a wonderful state of preservation.

The bequest made by the late Capt. H. B. Murray includes sixty-four objects falling within the scope of the Department, mainly small carvings in wood and ivory. One acquisition of particular interest is a large XVth-century South German figure of Christ riding on the Ass, a "Palmeisel" used in churches in the Palm Sunday procession. The bequest also contains two fine French XVIIIth-century pillars in marble and gilt bronze, a number of netsuke, and six Chinese cups carved in rhinoceros horn.

Purchases for the Museum.

Beyond question the most important of the acquisitions by purchase during the year has

been that of two life-sized recumbent figures of white marble by a Spanish sculptor of the second half of the XVth century, the figures, which represent Don Rod. Cardenas, a knight of the Order of St. James who lived in the reign of King Henry of Castile (1454-72), and his wife, T. Chacon, were formerly in the church of Pedro at Ocaña, a little town ten miles to the east of Aranjuez. The knight is represented in full armour, wearing the collar and badge of the order of Santiago and holding his sword; Dona Teresa appears in a widow's dress and holds a rosary. The second in interest to these magnificent figures is the marble bust of Charles I., signed by Hubert le Sueur (1650), and dated 1651; two years earlier the same artist's famous equestrian statue of the King at Charing Cross.

THE MANOR AND THE BUILDING OF MARYLEBONE

LORD HOWARD DE WALDEN is about to set on foot a scheme for dealing with his property in Marylebone, so as to give his tenants permanent holding instead of the casual London leases. Formerly known as the land Estate, the property, which includes the ancient Tyburn and 1410 Manors, is divided into two portions: the Crown lands of Regent's Park. The portion, to the north, lies within the lines of Park and Wellington roads, Clarendon and Henry streets, and Aecacia and Torr roads.* It was built over in the early part of last century; the Tyburn flowed in its south-eastern corner. In the plan of their newly-rebuilt High-street and the pile of North Gate flats, the inhabitants term the good and significant name of land Town. The larger portion, 200 acres, lies within the confines of the streets, Marylebone-lane, Blandford Northumberland streets, Cleveland, and Wells streets, Adam and Eve-ou Marylebone-road.* A plan of 1708, of John White the younger, shows this as consisting of the little village of church, taverns, and bowling-greens north-western corner, and the wide open known as Marybone Fields plots several measured parcels—the resurgitantes, swordsmen, and cudgel-John Price's designed plan of 1719 is a "Design of Buildings already begun, built in the parish of St. Mary la Belonging to the Right Honble. Edw. Harley and the Right Honble. Lady H. Cavendish Holles Harley, A.D. 1717 beginning was made with Oxford Cavendish, Square in 1717. Morden map shows that by 1732 had been built Cavendish square and the streets Oxford-street, Marylebone-lane, New dish-street, and Great Portland-street nothing directly north of Cavendish on the north side of which the I. Chandos had intended to build, after Price's designs, a lordly mansion private road to Canons. In 1739 their teste Maitland, 577 houses in the parish, and thirty-five persons with coaches. James Gibbs built St. in Vere-street, the (old) parish in High street, and Oxford Market down in 1880 for Oxford Mansion brothers Adam built Portland-place followed out Price's plans to the north west of Cavendish-square. Nas alterations for his All Souls' Church ham-places, Regent-street, and Oxford see our article, with plans and illustration of January 2, 1904, "Regent-street and Improvements."

In King Edgar's day the Abbess of held Tyburn of the King; the descent traced to Thomas Hobson, who exerted to Henry VIII. in 1544, and to Forset, who bought it of James I. for 3s. 4d., Marylebone (Regent's) Park reserved for the chase by the Arabella Forset brought it in marriage Thomas Austain, their son sold it for in 1708 to John Holles, Duke of Ne-

* These limits, Oxford-street, Marylebone and Park-road excepted, are approximate boundary lines are too tortuous to be described here.

& Son, additions to St. John's Hospital, Morden Hill; Messrs. S. J. Gerrard & Sons, six houses, Shell-road; Messrs. J. W. Heath & Sons, twenty-eight houses, Arthurton-street and Chudleigh-road; Mr. J. Nicholls, six houses, Manwood-road; Mr. W. D. Monk, store house at Lewisham Infirmary, High-street.

Maldens and Coombe.—At the last meeting of the District Council, the Surveyor submitted plans for widening the highway in Coombe-road, from the railway station to the parish church, at an estimated cost of 680*l.*; also for widening the highway in Kingston-road, from the Kingston boundary to the Prince of Wales public-house, at an approximate cost of 1,920*l.* The plans were approved.

St. Pancras.—Mains are to be extended in three streets at an estimated cost of 55*l.* The roadway on the south side of Tavistock-square is to be relaid with cleaned wood-blocks. Plans have been forwarded by Mr. E. L. Lutyens, on behalf of the Theosophical Society, for the erection of a large building on a site between Tavistock-square and Burton-street. The estimated cost of the building is between 30,000*l.* and 40,000*l.*

Southwark.—The Borough Council have decided to request the London County Council to hand over the 201*l.* unspent balance of the amount voted by the Council for laying out of the St. George's-yard, for the purpose of tarpaving the footpaths and other works. The following plans have been passed:—Messrs. Briant & Sons, 200, Kennington Park-road, S.E., formation and laying out of a street to lead from Albert-street to Delverton-road, also for the erection of buildings to abut thereon; Mr. H. Macintosh, Birkbeck Barristers' chambers, High Holborn, extensions to South London Central Mission, New Kent-road; Mr. A. Sykes, architect, 45, Finsbury-pavement, E.C., warehouse on site of Nos. 5-8, Bennett-street, and 10-14, Stamford-street. A plan has been lodged by Mr. H. Jackson, 10, South-street, Finsbury-pavement, E.C., for the formation and laying out of a street east side of Queen's-row, also for the erection of thirteen houses.

Statute.—The Rural District Council has passed plans for Mr. T. W. Simpson, for three houses in Common-road, Laleham.

Tottenham.—Application is to be made to the Local Government Board for sanction to a loan of 700*l.*, the amount required for purchasing the land and the carrying out of the necessary works for an improvement at the corner of St. Ann's-road and Seven Sisters-road. The following plans have been passed:—Mr. G. E. T. Lawrence, school and buildings, Culvert-road, South Grove, etc., at Kings, school and buildings, Risley-avenue, London County Council Estate; Messrs. Norfolk & Prior, conversion of rink, High-road, into picture palace; Messrs. E. Lawrence & Son, additions to Woodberry Down Chapel, Artillery-road. A plan has been lodged by Mr. C. Duckworth, for a cinematograph theatre at the east corner of Caversham-road and West Green-road.

Tring.—The plan submitted by Mr. Mead has been approved for the erection of additions to the Tring Flour Mills.

Wandsworth.—The Borough Council has accepted the tender of Messrs. E. Parry & Co., at 1,642*l.*, for paving Loxley-road, Springfield, with Victoria indurated stone, also the tender of Messrs. J. Mowlem & Co., Ltd., at 1,590*l.*, for paving Guildersfield-road, Streatham, with Aberdeen adamant. Tenders are to be invited for paving Graedale-road, Streatham, as a new street, also for repairs to the carriage-way of a part of Crescent-lane, Clapham.

South. The following plans have been passed:—Mr. F. L. Poole, additions to the Columbia Phonograph Company's works, Bendon Valley, Springfield; also 131 houses, Granville-road, Wandsworth-road, Hamblewick & Co., motor garage, Heathview-gardens; Messrs. Barlow & Roberts, three houses, Christchurch-road, Streatham; Messrs. F. & G. Foster, addition to workhouse, Swaffield-road, Springfield; Mr. C. F. Newman, warehouse, near 19, Tooting High-street; Messrs. H. Somerford & Son, alterations and additions to factory and warehouse, Windsor Works, Venn-street, Clapham, North; Messrs. W. Adkins & Son, additions to Mayfield, Bessborough-road, Rochampton; Mr. E. H. Henry, additions to Nos. 30 to 35a, Old Town, Clapham, North; Messrs. Roberson & Barrie, twenty-five houses, Crowborough-road, Streatham; Mr. C. Hallam, Primitive Methodist church and schools, Lynwood-road, Balham; Messrs. J. Marsland & Son, additions to St. Thomas's Roman Catholic Church, West-hill, Southfield; Mr. A. Budd, laundry near 99, Tooting High-street.

Watford.—Plans have been passed for Mr. Lewis Evans for additions to Lodge "Russells," also for Mr. Albert Timberlake, for two houses, Nash Mills. The Surveyor, reporting upon this plan, stated that six pairs of houses

are proposed to be erected similar to the two already sanctioned.

Wimbledon.—The Council have accepted the tender of Messrs. E. & E. Iles for making up the following streets at the prices mentioned:—The Crescent (sect. 1), 456*l.*; the Crescent (sect. 2), 417*l.*; Crescent-gardens, 220*l.*; Gladstone-road, Mews, 120*l.* They have also accepted the tender of Mr. S. Lane for making up Gordondale-road, at 347*l.* Lucien-road is also to be made up at an estimated cost of 365*l.* This work is to be done by direct labour.

OBITUARY.

Mr. J. J. Bannatyne, R.S.W.

The death, in Glasgow, is announced of Mr. J. J. Bannatyne, R.S.W., aged 76 years, member of the Glasgow Art Club, of the Glasgow Institute of the Fine Arts, and, since its formation more than thirty years ago, of the Royal Scottish Society of Painters in Water Colours. Mr. Bannatyne began his career as a designer for Messrs. Dalgleish, Falconer, & Co., calico printers, and frequently contributed to the Royal Academy and other art exhibitions.

Mr. R. H. Crabtree.

The death has occurred at Southport, on 15th inst., of Mr. R. H. Crabtree, representative of the Bath Stone Firms, Ltd., formerly Quarry Manager at Portland, Dorset. Mr. Crabtree was well known and esteemed in the professions, both in the North and South of England.

FOREIGN AND COLONIAL.

German Cement Industry.

To the above subject Sir F. Oppenheimer, the British Consul-General at Frankfurt-on-Main, devotes considerable attention in his annual report just received at the Foreign Office. It appears that the market for cement in Germany knows at present only two kinds—Portland cement and slag cement. Most of the cement-producing concerns are share companies, private factories being few and far between. The capital invested reaches a total of 400,000,000 marks. The possible total annual production is estimated at 450,000,000 barrels (of 170 kilos). For the cement industry generally, the year 1910 is reckoned the worst on record, not excluding the bad years 1903-4. The greatly increased facility of production has led to over-production, because the demand could not increase at an equally rapid pace, and the export, though still increasing, is becoming more and more difficult. The production has increased as follows:—

Year.	No. of Factories.	Production. Barrels.
1877	29	2,200,000
1887	45	7,050,000
1897	68	12,450,000
1901	85	19,500,000
1907	88	27,000,000
1909	112	45,000,000

*Possible production.

The price, which half-way in the nineties had amounted to about 6 marks 25 pf. per barrel, had, by 1901, sunk to 4 marks. In 1910 the price at times reached 3 marks 20 pf. to 3 marks 30 pf., in Berlin, even, to 2 marks 50 pf. to 2 marks 80 pf., though the cost of production has not, so far, fallen much below 4 marks, which was the calculated expenditure before the modern methods had come into operation. The home demand was, in 1910, affected by the building strike, and afterwards the building market did not improve as the cement industry had anticipated. The German export to South and Central America has increased during recent years; but these markets will eventually be lost, as the large North American factories push their competitors aside, and as local factories take up the supply, such as are being built in Venezuela, the Argentine Republic, and Chile, partly with the assistance of the respective Governments. In a similar way the markets in China, Java, and Japan are becoming more and more supplied by local factories. The change in the North American market has been remarkable. The consumption has there tremendously increased, so has the local production, which has risen from 150,000 barrels in 1885 to 75,000,000 barrels in 1910. The German export to North America, which in 1895 still amounted to 1,435,455 barrels, receded in 1910 to 83,003 barrels.

The import of foreign cement into Germany has been facilitated by the absence of any German customs duty. The last customs tariff had at first provided a customs duty of 50 pf. per 100 kilos., but this was abandoned at

the subsequent treaty negotiations, free entry of foreign cement into Germany secured at least till 1917, the end of the customs treaties. The demands for a tariff, when the opportunity has occurred, have been abandoned by the German industry; but they have become loud the bad result of the year 1910. It is mentioned that the German cement have formed a pan-German union, so the purpose of controlling the quality are made with samples taken at regular intervals, without the knowledge of the ing works, and any works failing to standard quality is warned the first time the second time is excluded from the The German works claim that foreign ought to be subjected to the same test entry into Germany.

Works in Austria-Hungary.

The communal council of Mostar, has decided upon the construction of water supply aqueduct at a cost of 600,000 (25,000*l.*), and also the erection of a hospital.

The city authorities of Budapest, decided to erect a water tower, with content of 200,000 cubic metres, at 150,000 (6,000*l.*), and to bore two wells and construct a siphon, and in connection with Ujlak water works. Tenders will be invited by "Dr. Johann Buzath, IV. Város 16," Budapest, up to 15 September may be seen at the office of the Water Directorate.

A syndicate, with a capital of 1,600 (about 65,000*l.*), has been formed at Prague to erect a water tower, at 150,000 (6,000*l.*), for the purpose of erecting a large school at Tremoschna, near Pilsen.

The Budapest Commission for the erection of municipal dwellings, has decided the erection this year, at a cost of 5,000,000 (about 200,000*l.*), of eight five-storied buildings to contain 850 two and three-roomed flats. Schools are also to be erected at a cost of 5,000,000 kr.

A hydropathic establishment with 100 beds is shortly to be constructed at B. According to the plans prepared by Dvorak, the cost will be 1,600,000 kr. (66,700*l.*).

A company, under the name of the Hot Imperial Hotel Company, has been formed at Carlsbad by Lord Westbury, of Alfred Schwalb, of Carlsbad, Messrs. V. Freytag, Meinong, and Portois & Vienna, for constructing and managing a hotel at Carlsbad, and for obtaining concessions for the construction of light railways. The company has a capital of 4,000,000 (about 160,000*l.*), which can be raised to 11,000,000 kr. (about 458,000*l.*).

List of Competitions, Contracts, etc.

Some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment, xix.; Auction Sales, xxiv.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

PRICES CURRENT OF MATERIALS.

The aim in this list is to give, as far as possible, the
current prices of materials, not necessarily the lowest.
The quantity obviously affects prices—a fact
should be remembered by those who make use of
information.

TATTERSHALL—AND AFTER.

THE active interest taken by the public and the Press in the fate of Tattershall Castle may well be hailed as presaging a more enlightened attitude towards the treasures bequeathed by the past ages. It is for the geologist and the architect to take advantage of this awakening, and to set and advise as to the best means of making operative what we can justly claim to be the wish of all educated people. The Government made a start a short time back by appointing a Royal Commission, but Lord Burghclere, the Chairman of this Commission, points out in a letter, published in the *Times* of

September 26, that this Commission has no authority by which it can restrain the destruction or sale of ancient buildings, and that a necessary complement to its work would be the investment of a responsible Minister, assisted by an Advisory Committee, with power to deal with such matters.

This should not be difficult to do, as we have already an excellent example in France, and the country is crying out for the appointment of a Minister of Fine Arts who would combine this duty with others almost equally urgent.

The Royal Commission has, during the short time that has elapsed since its

appointment, done a great deal of work in drawing up a schedule of valuable buildings and other objects of national importance, but the programme before it is so large that the most favourable computation puts as the term of its labours a period of twenty years, and during that time any amount of damage might be done.

At the same time, as we pointed out in our issue of September 15, it is not easy to legislate on a general basis without a definite schedule of the buildings of sufficient value to demand the abrogation of private rights for their protection. It might be possible to claim

notice of any proposed action on the part of any owner of any structure above a certain age, but this would be likely to create difficulties, and, moreover, mere age is by no means a good criterion of interest. It would undoubtedly be far preferable to have each structure identified, and those interested in it as owners or occupiers duly notified that it is regarded as a national monument.

Assuming that this alternative is accepted as preferable, it makes the investigation of our ancient buildings and other remains an urgent matter, and one that should certainly not be allowed to drag over a term of twenty years. We do not intend to imply that the Royal Commission is not using the utmost expedition possible for a body constituted as it is, but it certainly appears to us that the method laid down for its procedure is unnecessarily cumbrous and wasteful. It is obviously impossible that the members of this Commission can give more than a small portion of their time to this work, while, on the other hand, the work allotted to them has already been in a large measure effectually done by local archaeological and architectural societies, some of which have very full records of their own districts or counties.

While no exception can be taken to those gentlemen forming the Royal Commission, there are dozens more of equal competence for the purpose of this work scattered throughout the country whose services are not being sufficiently utilised, and it would be easy to form a much larger body, divided into district committees, for the purpose of correlating and supplementing the work of the societies. It might be desirable to retain the Commission in its present form as a kind of Court of Appeal for the purpose of ensuring uniformity and balance in the treatment of the various districts, either hinting at a more inclusive programme in one or checking over-elaboration in another, but in this case its duties would be greatly lightened.

We have no hesitation in stating that some such method as this would enable the whole country to be dealt with in the course of two or three years. Even if the list so obtained were not absolutely complete, there would be no difficulty in providing for subsequent correction or supplement in cases of doubt or difficulty, and an Act for the protection of antiquities could be made to cover the works as soon as they were scheduled.

By this means no time would be lost, and we should soon be in a position to take prompt measures in the case of threatened buildings, either by compulsory purchase, by agreement for maintenance, or by such other means as might be best suited to the case in question.

With the wealth of voluntary effort at the disposal of the nation in the study of our antiquities it appears a most wasteful proceeding to take so little pains to organise it, and if it be organised on the lines suggested there is no doubt that we should, in a very short time, be in a position to make a protective Act of Parliament operative. Voluntary effort has in the past done so much for us in various directions that there seems no reason why we should not count on it to help us in our plans for the future.

STAGE ARCHITECTURE.

MR. GORDON CRAIG'S exhibition of drawings and models for "Macbeth" and other plays, at the Leicester Galleries, awakens interest in a subject that is rarely taken very seriously. Your dramatic critic, for instance, whatever may be his views about a play, has usually nothing but praise for the scenery; it often indeed comes in for the ha'pence while the play is receiving the kicks. And there are no doubt many pretty stage effects that have been mastered by our scene-painters, and that are a delight to the eye. But dramatic critics would mostly agree, we imagine, that modern stage scenery in this country errs on the side of over-elaboration, more especially in Shakespearean and serious drama. Mr. Craig's aim is to do away with this elaboration and to invest stage scenery with a quality which brings it into psychological relation with the action of the drama. Further, he has views on stage lighting, aiming at a more natural effect than is obtained by the conventional footlights, head and side lights, and limelight. We do not know that there is anything particularly novel in all this; not at any rate so far as other countries are concerned. Wagner, as we all know, carried out most successful experiments of the sort in his theatre at Bayreuth. Mr. Craig is moved by the same poetic considerations as Wagner; but Wagner was a Teuton, while Mr. Craig, we take it, is a Celt. His type of art clearly belongs to what used to be called the Celtic movement: that is, it strives to express a certain imaginative quality, to evoke a certain imaginative beauty and mystery, for their own sake. It places art in relation not to the symbol of life, but to the symbol of the haunting unknown. Wagner's symbolism was, just as was the symbolism of the ancients or of the Christian era, *au fond* philosophic; it was either a commentary on, or an explanation of, life or action. Mr. Craig's is a commentary on mystery: the mystery of space, or of structure, or of man in relation to structure and space; the mystery of shrouded lights, of the gradations of atmosphere between midnight and dawn, of red lights penetrating vistas of corridors and doorways. There is an undeniable beauty in all this; there is also a distinct and subtle poetic quality (if not very profound) which we would be delighted to find illustrated in the theatre, but it is not the last word in the art of the scene-painter—not at least so far as it finds expression in Mr. Craig's drawings. These drawings, indeed, convey so excellently in line and colour the painter's feeling that we doubt—it is only a pious doubt—that they would carry the same effect if they were built up to the scale of stage scenery. They are indeed very pretty drawings. The secret of their attraction is perhaps largely to be found in Mr. Craig's choice of simple lines, in his appreciation of the value of blank spaces, in his desire to bring the scale of the scenery into imaginative relations with the scale of the figure, and to reduce it when necessary, as, for example, in the case of a simple living-room, to something like natural dimensions. And there is,

of course, his lighting—the shades and sombre tones. But Mr. Craig's drawings and theories do not embody whole art and grammar of scene-painting. We imagine, indeed, that very much the same effect at which he aims could be obtained by a skilful arrangement of curtains. For our own part, we are inclined to think that arguments might be advanced—as they have indeed been and plausibly enough—to show that the scene-painter comes in at the end of the art of acting flies out at the window. But the scene-painter or the scene-builder has become a permanent part of the institution of the theatre, and we do not do away with him even if we will. When he first came into view, well, in the middle period of the Italian Renaissance, he was, if not an architect, a man with the training of an architect. To hark back to particular names, Baldassare Peruzzi, the architect of the Massimi Palace in Rome, would be likely to have been the protagonist in the evolution of modern stage scenery, but long before his time Brunelleschi had tried his hand at stage illusions, religious representations at Florence. These men, of Latin blood, did not play with the mysteries of the world with the suggestiveness of haughty shadows, but with the luxury of material, of line and form. Some of the most delightful drawings which have come down to us from that time, and later, are those which deal with architectural scenic effect; not, it is true, devised so much for plays as for pageantry and masques, for the elaborate ceremony of some Court festival. The architect—when the designer was an architect—gave riot to his imagination, built castles in the air, imposing balconies and staircases, vast halls with radiating vistas, beyond the means, if not ambitious of any ducal or papal client. Fresh in Italy, Inigo Jones won much of his early reputation through his invention and skill in stage arrangement. The art would seem to have fallen into other hands for a century or two, and fell to the practice of a sort of crafter of a type of painter rather better fitted to an itinerant house decorator, and not so good as the painter who is permitted to hang his work in galleries, with, of course, some notable exceptions. At the beginning of last century the voice of the archaeologist was heard tentatively testing against the inaccuracy of certain stage effects, either in regard to cost or scenery, but it was a voice in the wilderness, and made little or no impression on the actor-manager of the time. To-day the actor-manager is alert to everything but acting, and even in the theatre he wishes to be above criticism. He called in, to keep him right in regard to furniture and details, the best of the Tottenham Court-road can give him. Henry Irving sought the aid of Albert Tadema to the vast advantage of his or two Shakespearean pieces produced at the Lyceum, and later actor-managers have invoked the aid of Royal Academicians and other artists of reputation. Mr. Craig has made a certain appeal to the imaginative and poetic sense, but he is largely content to ignore the seeking spacious mass and form, and the combination of these which makes

at one calls architecture. Alma Tola, with his undisputed architectural knowledge, has provided some of the stage scenery of our time. And there are others, even architects themselves, who might be engaged usefully to set the theatre in an artistic phase, so very dependent upon architectural and decorative skill. We do not deny that the modern scene-painter contrives charming acts. Mr. Craig shows how he might lend these effects into the realm of artistic suggestion; Bibiena, and the old Italian architects who devised scenery, showed how consummate imaginative ability could be expressed through a mere material apprehension of the value of architectural treatment.

NOTES.

THE disclosure by Mr. Albert Ball of the details of last year's negotiations between him and the National Trust appears to be this Society in a very awkward position. While admitting that it is difficult to put an exact money value on property of this character, it is clear that the National Trust have been very wise in neglecting the opportunity which was offered to secure the Castle intact in 1900. It can only be imagined that the Society knew very little of the value, its contents, or its historic interest, as otherwise they could not have been misled with so little consideration of a proposal that must have elicited a response throughout the country. So much good has been done in the past by the National Trust that it would be unfair to be too hard on them for one mistake, but it mainly looks as if more expert advice were needed in order that their work might be efficiently carried on till such time as it is taken over by a Government Department.

ON the heels of Tattershall Castle comes the threatened destruction of the Louth Bridge, one of the most interesting mediæval bridges in the Lake district. This time it is the local authority which is responsible for the proposed vandalism, the Bridges Committee of the Cumberland County Council having recommended the building of a new bridge. This action is the more extraordinary in view of the fact, as stated in Robert Hunter's letter to the *Times*, that Mr. Francis Fox's grouting system has been successfully applied in the restoration of the picturesque bridges over the Derwent at Grange, quite near the bridge now threatened. Our readers are, no doubt, conversant with the grouting method, so that we need only add that, besides having been proved thoroughly effective in enormously increasing the strength of the old work, it is at the same time very much less costly than a rebuilding scheme. For our part, where the old bridge is inadequate in width for the needs of the traffic we would far rather see a road diversion with a new bridge than the destruction of a structure possessing so much interest. In other cases than that of inadequate width, cement grout will usually do all that is required.

THE White Horse Cellars, and Hatchett's, Piccadilly. NEXT month will be offered for sale, at the Mart, the freehold property, Nos. 67, 67A, 68, and 68A, Piccadilly, which comprises Hatchett's Restaurant—formerly Hatchett's Posting-House, and the White Horse Cellars—with some adjoining shops, and, in the upper floors, the rooms of the Grosvenor Club. The premises, yielding an aggregate rental of 6,900*l.* per annum, cover nearly 6,000 ft. super. at the corner (east) of Dover-street and Piccadilly. They were built, of red brick and Ancaster stone, in 1884, by Mr. John Grover, contractor, at a cost of more than 32,000*l.*, with 70,000*l.* for the site of the Cellars, after the designs of Messrs. W. S. Weatherley and F. E. Jones, as described and illustrated in the *Builder* of December 27, 1884, and November 28, 1885. The ground floor having been converted into shops in 1889, the premises were reopened in 1897 as the Avondale Hotel and Hatchett's Restaurant. In the rebuilding were preserved some relics, including the original signboard bearing a white horse, the smoke-jack, and an oaken drain-pipe of Abraham Hatchett's hostelry, the headquarters in London of patrons of "the road," and of the West of England mail coaches. The Old White Horse Cellars were on the south side of the street; they latterly became a parcels office, at No. 155, the Bath Hotel, which, with Walsingham House, gave place, in 1903-4, to the Ritz Hotel. There is a drawing of the Cellars by Cruikshank, and a coloured print by Rosenberg, 1828, after a drawing by J. Pollard.

HOUSES *versus* **FLATS.** DESPITE the deplorable condition of the market in respect to the sale or mortgage of flat properties, this type of residence is still increasingly in demand, while the larger town house, except in the very best districts, is becoming more and more difficult to let or sell, and leaseholders who are precluded from subdividing their properties are often very unfavourably placed. Even where there are no restrictions precluding the conversion of large houses into flats it is a matter to be treated with the greatest caution. So many houses hardly provide sufficient area on each floor for a well-arranged flat and any considerable extension may be prohibitive on the ground of cost. Some conversion schemes that have been financially successful divided each house into two occupations, the ground floor and half basement being shut off from the upper floors. The combination of two houses to form a block with one good flat on each floor seems a possible solution that might have received more attention than it has, but all schemes involving much work in alteration require very careful study if they are to compete successfully with new buildings, as it will hardly be possible to give quite as convenient arrangements and the subsequent cost of upkeep will invariably be somewhat higher. It is actually easier to convert large houses into a comfortable private hotel than into satisfactory flats, and possibly the general trend of our needs, which is to some extent influenced by the form of accommodation available, will bring this type of housing more into

demand, as meeting the requirements of many who, under different existing conditions, might have adopted the flat as their dwelling.

HERALDIC IMPROPRIETIES. HERALDRY is an art which is subject to many laws strange to the comprehension of the matter-of-fact citizen. Its purpose as a means of identification in tournament or war has gone and only experts, or a few diligent readers of Mr. Maurice Hewlett, can view with insight and emotion the symbols and devices which enrich the mansions, the carriage doors, and the stationery of the nobility. The considerable decorative licence assumed by heralds is often disconcerting. For instance, in the Arms shown in the drawing on p. 373, the use of helm and crest seems out of place. No woman, other than a reigning sovereign, is allowed to bear either; even the coat itself must be borne upon a lozenge instead of a shield. Surely, then, it would be more reasonable to apply some similar restriction to all impersonal arms. Does not the Ulster King-of-Arms forbid the use of a helm in the armorial bearings of the cities and towns in Ireland? Even where the crest is shown without its supporting helm it is little less ridiculous. They are so closely united by the associations of the past that, to use the one without the other merely gives a feeling of incompleteness to the achievement. In the case of the Australian arms it should not have been a difficult problem to find accessories more in keeping with the democratic characteristics of the country.

MUNICIPAL IMPROVEMENTS AND DISTRESS COMMITTEES. AT this time of year many of our municipal bodies are in conference with distress committees over the question of providing work for the unemployed during the coming winter. The main difficulty that crops up in undertaking improvements for the purpose of providing employment lies in the fact that usually but a small proportion of the expenditure goes to unskilled labour. Of course, the proportion depends on the type of improvement adopted, but generally the utmost that can be allotted for work suited to the capacities of the unemployed is between 30 and 40 per cent., the remainder representing the cost of material used and of the skilled labour necessary.

THE CRYSTAL PALACE.

WHILE the fate of the Crystal Palace still hangs in the balance, a short account of the structural features of one of London's most familiar landmarks may be excused. For close upon sixty years this mid-Victorian "fairy palace," conceived in the expectation of universal peace, and destined, perhaps, to disappear amid the war-clouds of the XXth century, has queened it upon Sydenham Hill in the pride of its naked girders, cast-iron as the ideals of the age which gave it birth. If the analysis of this ferro-crystalline fairyland will not advance us many steps towards the designing of Oberon's palace, it will, at any rate, reveal to us the cunning hand of the master-builder.

The Crystal Palace, as it now stands, embodies the materials, and perpetuates the principles of the building erected in Hyde Park in 1851 to house the Great Exhibition, the design of which owed its genesis to the

following circumstances. In answer to the invitation of the Building Committee no less than 240 designs were submitted; the having been all rejected as unsuitable, the Committee prepared a design of their own, the chief objection to which was the impossibility of finishing it in time, entailing as it did the laying of about 16,000,000 bricks. At this juncture, Mr., afterwards Sir, Joseph Paxton proposed a gigantic greenhouse of iron and glass, an enlarged edition, in fact, of the great conservatory he had already erected at Chatsworth, in his capacity as head-gardener to the Duke of Devonshire. The idea was at once adopted, and with the assistance of the contractors, Messrs. Fox & Henderson, the Paxton scheme was carried into practical execution. The plan was cruciform, and consisted of a nave 1,848 ft. in length, and a central transept 408 ft. in length, both 72 ft. wide. These were flanked by aisles 24 ft. wide. These dimensions, it will be noted, are all multiples

of a casting of similar section, with corresponding snugs at either end, alternating with projections upon which the cross-girders take their bearing, the length of the connecting-piece being governed by the depth of the girders. Bolt-holes are cast in the snugs of column and connecting piece, and bolts and nuts secure them in their places. Thus the three-story portion, both as originally erected, and to-day at Sydenham, consists, first, of columns 18 ft. 5½ in. in length, bolted to base plates, next of connecting pieces 3 ft. 4 in. deep, supporting the girders, above this, again, are columns 16 ft. 7½ in. long, with similar connecting pieces supporting the girders, and the arrangement is repeated once more for the third story. The girders are single castings 3 ft. deep by 23 ft. 4 in. in length, divided into three compartments by vertical struts connected by diagonal ties and struts. Each nave and transept column, therefore, considered as a whole, was at Hyde Park held laterally in its place at three different levels by girders in two directions longitudinally, and in one direction transversely, the width of the nave and transept being, of course, left clear. Elsewhere the system of columns and girders divided the building on plan into squares of 24 ft.

The whole of these materials, with the exception of the roofing, were made use of in the re-erected building at Sydenham, the plan and dimensions being altered as follows. The entire length was shortened to 1,608 ft., the nave being of the original width of 72 ft., with an enlarged central transept 120 ft. wide, 408 ft. in length, and 170 ft. in height to the centre of the semicircular roof. At either end of the nave were transepts of the same width as the nave, also 408 ft. in length. The arrangement of aisles and galleries remained substantially as before. A fire which occurred in 1866 destroyed the north transept, with the bays of the nave to the northward, and this has never been rebuilt, so that the present over-all length is considerably reduced. On the outside of the present northern end of the nave may still be seen the columns which carried the principals of the roof of the destroyed transept. The nave and end transepts are of the three-storied construction described above, with the addition of an extra 8 ft., from which level spring their semicircular roofs, the height from the floor to the centre being 106 ft. The central transept has an extra story, the height of an additional column, connecting piece, and girder. The columns supporting the nave and transept roofs of the original building were placed in one straight line; at Sydenham, in front of every fourth bay of 24 ft., an additional bay is advanced 8 ft. into the central space to carry the roof principals, which are all of wrought-iron. Wrought-iron ties give additional lateral strength to these portions. The glazed facing of the whole building is divided into stories corresponding with the internal vertical divisions. Each bay is subdivided vertically into three by intermediate posts of wood. The girder portion is occupied by louvres. The fall of the ground from west to east necessitated a basement-story on the east side. The columns of the facing of this story are all of iron. At either end of the main building are wings of similar construction projecting eastwards, each 574 ft. in length, the southern wing connecting with the railway-station by a colonnade 720 ft. in length. The water-towers, supplying the head of water for the great fountains, were designed by Brunel. They have an extreme height of 284 ft.

The Crystal Palace was opened by Queen Victoria on June 10, 1854, the first column having been placed in position at Sydenham on August 5, 1852. The materials of the Hyde Park building were purchased for re-erection for 70,000l. We have confined ourselves in the foregoing description to the anatomy of the structure itself, which the space at our disposal has compelled us to

sketch in the barest possible outline. The historical and educational aspects of the subject we must leave to abler pens than ours.

CONTEMPORARY ARCHITECT AND THEIR WORK:

MESSRS. EAMES & YOUNG, OF
ST. LOUIS.

BROADLY speaking, a city as far removed from the thoughts of a people as St. Louis is from the English can but little interest them. It is doubtful even if this particular town were close by and within the British Empire whether the ordinary enlighten-

[Photo. by the Curtis Studio.]

Mr. W. S. Eames.

Englishman, interested especially in the pleasure-giving things of life, would be attracted either to the town or its people or find himself in sympathy with its ambition or their aspirations, which he would be apt to find of the sort common to all new communities. In a restricted sense anybody, and everybody capable of being interested in anything would find much that is fascinating within the town. The traveller and observer, the builder and the artist would all note local peculiarities, pleasant and otherwise

Mr. Thomas C. Young.

The Crystal Palace: Column and Girder System.

of 24 ft., the distance from centre to centre of the supporting columns. The nave and transept, with their aisles, were three stories in height, while on either side were two-storied portions 72 ft. in width, containing galleries at 23 ft. above the floor-level, and outside these, again, a one-storied portion of the same width. The nave and aisles were roofed on the ridge and furrow principle, while the transept had a semicircular roof.

Here it will not be out of place to describe the component parts of the structure, which may be seen to-day at Sydenham, as sound as they left the moulds. The columns, of cast-iron, have a uniform diameter of 8 in., the thickness varying from ½ in. to 1½ in., proportioned to the areas of roofing to be supported. The sectional area is increased by four fillets. Between these four snugs are cast at top and bottom. Each pair of columns is connected vertically by

which could not be duplicated anywhere else on earth.

To the first-mentioned its position on the map alone would be interesting. Its location on the Mississippi River a few miles south of its confluence with the Missouri, "four or five hundred miles from anywhere," it appears to be, as indeed it was for many years "the jumping-off place" from civilisation into "the wild and woolly west" which lay between the Mississippi and the Rocky Mountains. Without knowing it, one would suspect it to be the great trading camp, manufacturing outpost, and storehouse for all that vast territory—at least south of of the Missouri. The "wild and woolly" is rapidly disappearing before the march of civilisation, but St. Louis remains, as one would have expected to find it, the emporium of the south-west, bearing a great many scars of the battle between enlightenment and brute instinct—a battle still in progress, but with the result settled. French names to many of the streets and places, the Carnival Procession of the Veiled Prophet, the existence of an old French aristocracy speak of its early history under the Bourbon kings of France, and add to its life an interest that is shared only by the other old French towns—New Orleans and Detroit—in America. The existence of numerous beer-gardens, beer-cellars, underground restaurants, colossal breweries, and the generally hospitable, good-nature of the inhabitants is probably due principally to the large German element of the population, but, as regards the institutions, assisted by the hot climate of the place.

It is the climate which is the *clou* of St. Louis. Sunshine rules during nine or ten months of the year. Floods, flies, mosquitos, malaria, and slight earthquakes have a tendency to keep things moving; but they are mere diversions from business that are regarded as small cause for perturbation by the inhabitants. Storms and cyclones have played a fairly conspicuous part in the town's history, and have left here and there their own memorials. The two or three months of winter are even more depressing than the corresponding period in London or Lancashire. There are the fogs and damp cold that characterise the English winters, and though the fogs are less frequent the cold is much more intense than it ever becomes in these islands. Another discomfiture to pedestrians in the streets in the business districts is the mixture of soot, snow, and sand brought to the consistency of thick "grout" by the melting effect of steam-pipes under the pavements or "side-walks."

From the pictorial and constructive points of view the objects of greatest interest are the big bridges over the Mississippi, the quays, the shipping, the enormous railway

yards—not because they are greater than individual cases at other large towns, but because they are so much under one's eye—and the magnitude and modernity of the buildings in connexion with the railways and the other newer buildings—especially the warehouses—throughout the town. Bigness and activity in the bright sunshine are the summary of the local characteristics which form the background to any subject with a setting in St. Louis. As to the architecture, it is nearly all very modern. There are probably not more than a half-dozen architectural works antedating thirty years ago in the whole big city. Most of the buildings erected before the Civil War have been either demolished or are too uninteresting to note; those erected after that time, but prior to about 1880, are principally in the "Italian style" of the speculative builder who flourished high and above all "architects" in those days. Early in the eighties

Richardson and Peabody and Stearns—architects from Massachusetts—made the first important breaks in the dull monotony of the streets by erecting a few commercial buildings and houses in the then popular "Romanesque style." About the same time the effects of the Centennial Exhibition (which had been held in Philadelphia in 1876) began to be felt as far west as St. Louis. The people sought the assistance of architects to design their homes instead of buying at exorbitant prices from the speculators. Commercial buildings which had long been the field of either the mere contractor or of the "engineer" were given over to the better instructed men who could arrange a plan and invent new methods of construction, who desired also to make their buildings expressive of and suitable to their purpose, and who called themselves "architects."

The popular understanding as to what an "architect" might be was extremely vague; no business man would have employed one as an "artist"—an "artist" being supposed to be a long-haired, more or less obscene sort of fool, "a sissy man," a sexless creature commonly spoken of as "that ass."

The client was accustomed to dictate his wants to a builder, and when he "employed" an architect he went about his business in the same way; he gave instructions that he wanted a "brick" house, or "rock-faced stone" one; and it was left to the architect to understand that he wanted windows that could be cleaned, that could be "looked out of," and for the purpose, otherwise, of letting light into the room. When it came to warehouses and office buildings, it was upon the architects' ability to satisfy his very practical wants that "architects" rose in his estimation and became something more than mere "engineers"—who had a "lot of book learning but no sense." He discovered, too, that the buildings the "new-fangled" architects built "looked like" whatever they were—negatively speaking, a warehouse did not look like a factory nor a factory like a church. They contrived to put elevators into the building without "blocking up the passageways"; introduced "mail chutes,"

Bank Buildings, St. Louis.

Messrs. Eames & Young, Architects.

"electric fans," and "fly screens"; and knew "the value of every square foot" of floor space; they got rooms the right height and depth, and corridors which "looked clean without looking like a cold storage room"; and, besides all this, they made "pretty pictures" of the rooms or buildings, and "hired an artist to do the painting," or if the architect could himself "do the painting," he would probably be praised as having "done it as well as an artist could."

Such a *clientele*, irksome as it must inevitably become to the architect of artistic temperament, is not without compensating characteristics in other respects. It recognises the many qualities above mere refinement; it discriminates between expert and merely professional opinions; its decisions favour good judgment in all things, as far as its understanding enables it to come to any conclusions. To the people of the State of Missouri, who pride themselves on their incredulity, one votes especial credit for their desire to be "shown," in order that they may know. "I'm from Missouri—you must show me," is an expression which is like a gin-fizz—it is all froth at the top, but there is substance below. It took a long time to convince them that art is an object in itself worthy of the attention of everybody, and the true appreciation of it a hall-mark of the most distinguished intelligence. Very little, if anything, had been done by way of educating the public in architecture before the year 1885, when William Sylvester Eames and Thomas Crane Young entered into partnership to practise that profession and study that art in the city of St. Louis; therefore it fell to their lot to become the pioneers of architectural art in the "Great South-West," and by their works to educate a people to the point of grasping their own higher ideals.

Their earliest work, consisting principally of private residences, showed the influences successively of Richardson and Hunt, and later, immediately after the Columbian Exposition of 1892, of McKim, Mead, &

White. But in whatever style they worked everything they designed possessed qualities of its own. It harked back to good precedent, but was none the less distinctly modern and peculiarly suited to the essential requirements created by the St. Louis climate. In a short time they had established a style which was recognised as "St. Louis architecture," which became at once the object of "the sincerest form of flattery" and vituperation on the part of such "contemporaries" as the town afforded them.

The Studio Building, the Bank of the Republic, the house of Mr. W. H. Thornburg, and the Gate Lodges to Westmoreland-place were among the earliest examples of

Italian Renaissance influence in the United States. The style may have been suggested by the success of the Villard House in New York (designed by J. Morrell Wells, McKim, Mead, & White), but the adaptation was wholly peculiar to the climatic and social conditions of St. Louis, and the buildings remain among the most individual and satisfying architectural works in the city.

With the Classic and Renaissance work in England Messrs. Eames & Young had indicated their sympathy in several designs as the first building of the Lincoln Trust Company, the Chapman residence in Vander-platz, two large houses in Washington-terrace, the houses of George L. Allen and D. R. Francis, and the banking house of the Mississippi Valley Trust Company. The corner treatment of the latter immediately reminds one of the similar arrangement at the Bank of England, but a comparison shows also the interesting dissimilarities and considerable originality of the design as a whole. It was among the few Classic designs erected just prior to the Chicago Exposition.

The great group of buildings known as Cupples Station—a vast assemblage of well-planned, excellently organised freight warehouses in connexion with the railways—was the first very extensive work of Messrs. Eames & Young, and extended their practice to one of the first magnitude in America. It shows traces of the influence of the work of Richardson, but in point of simplicity and sobriety, and in suitability to purpose, it is better than anything carried out by that redoubtable genius. The general excellence and thoroughness of these buildings gained for the firm the confidence and esteem of the leading business men of the city and a permanent place among the best of their *confères*. A large number of important commissions followed, especially warehouses, shops, and office buildings. Nearly every important street in St. Louis contains some huge monument to their designing skill, in some cases to their engineering rather than strictly architectural work. Some of their high buildings are among the best of the kind to be found anywhere in the United States, such as the Union Trust Building, Liggett Building and Wright Building. Their practice, now second only to that of Mr. Burnham in the "West," has extended to various parts of the country. A very large hotel at Seattle, Washington, the military prison at Leavenworth, Kansas, the Fine Arts Building at the Omaha (Nebraska) Exposition of 1898, the Custom House at San Francisco

THE PLACE OF THE STUDY OF BUILDING CONSTRUCTION IN ARCHITECTURAL EDUCATION.

THE opening meeting of the Architectural Association, Session 1911-12, was held at 18, Tufon-street, on September 25, when Professor Beresford Pite gave the following address:—

"The history of architecture is that of building construction, the means being involved in the consideration of the end attained. The two elements of architecture, the purport of the building, which involves the civilisation of the race, and the æsthetic ideal and traditions of the builders both finding embodied expression in construction. A genuine architecture has neither of these two elements singly, as it cannot be without purpose or beauty; but it involves their combination under the conditions of the science of building, and, despite the tendency of books of modern architectural history to concentrate attention on religious, civic, or domestic habit, or upon a commerce in traditional architectural forms, the building construction of man in different countries and ages is the field of the true study of architectural history.

The elements of architecture are not really capable of a practical dissociation, though possibly of separate analysis. It would be difficult in any historical review of buildings to eliminate architectural from non-architectural examples, and this is the problem of separating the study of architecture from that of construction. In different eras, and with races in varying measure, the æsthetic or the constructive faculty has predominated. The great era of Grecian art stands for the former, as that of Roman ascendancy does for the latter; but to some extent both are always present, being interdependent, and they act and react as stimulants to the production of fresh architectural developments.

Many instances might be cited to illustrate

the necessity of allowing that good building and good art are the same; the quality is properly common to both, admirable construction having beauty in building as well as in other workmanships. Construction as an art, in entablatures, domes, vaultings, arcades, roofs, staircases, and joinery, offers abundant examples which do not permit the disintegration of artistic effect from constructive skill; both elements are practically in operation, and we can only describe the result as beautiful building construction.

Architecture as a constructive art offers a healthy sphere for a new enthusiasm. Ancient buildings will awaken it in those to whom the glamour of antiquity is golden, while others, to whom the practical aspects of modern life appeal more strongly, will find an incentive in the constant development of new requirements of plan and the adjustment by invention and experiment of materials and workmanship.

We shall perceive in the practical application of a definition of architectural beauty, based upon beautiful construction that ancient and modern builders alike, when working with devotion, produced results which are satisfying. We shall then enter into a sympathetic union of aspiration (which perhaps may be a new experience) in finding that buildings are the expression of earnest life, and in the revelation of a fresh harmony of thought we shall discover one of the secrets of the mystery of art.

Intelligent antiquarianism and a sympathetic practicality of mind are each valuable as a standpoint for the architectural student, and both are necessary to a helpful consideration of the many branches of study included in building construction. The pursuit of the most prosaic and apparently unattractive of the building crafts is not successfully carried to the point at which the student becomes first a master and then a creator by merely picking up the latest threads of practice, contented to learn just how the thing is now done in order only to employ a process to attain a result. Building art is not such tame science as this. In every work which issues into real architecture there is scope for earnest investigation of the motives of derivation, and in the pursuit of such studies lie the incentives to further new development or design.

It will be evident, if material and workmanship may be assumed, in any view of the art of architecture and form only considered, that the scenic make-up in stucco of an architectural Order or style is a result equivalent to the original construction as an expression of art. The study of form and proportion in an academic classic method, or by the so-called historic periods, which ignore the constructive craftsmanship of building art, is delusive and harmful. Translated forms in any rearrangement, "freshly designed" maybe, are as empty and vague of meaning as the decorative inscriptions composed of disjointed sentences from the Koran employed in Mahomedan building. Unhappily, a knowledge of the forms of architecture and a knowledge of modern building construction, each separately studied, are to a great extent the staple of present-day studies, examination, and practice, and to this imperfect method of education much of the superficiality of design and construction in modern architecture may be justly imputed.

The sense that the architect of a particular building was emphatically the master of his work, rather than the unwilling slave of intractable materials and awkward conditions, is so rarely conveyed to the mind by a modern erection other than a simple work of engineering, that the conclusion is enforced that many architects have no genuine enjoyment in their handling of the building crafts, and are unable from want of properly-directed study to express any appreciation of the means they employ to attain their ends in their work.

To the architectural student the remedy for this weakness does not lie in devotion to a new style of architecture, but in a new style of building; not in a fresh revision from licence in form to austerity, or in a craze for individualistic ornament. The remedy is a complete recognition of the artistic value of thorough knowledge and direct purpose in construction. "In quietness and confidence shall be your strength—but ye would not." Genuine interest will be found in the quality of each craft or trade, and the unaffected employment of each for its

D)

(won in competition), and the Rosenberg Library at Galveston, Texas (also won in competition) are among the more interesting of such works. The most ambitious and monumental projects undertaken by Messrs. Eames & Young include the improvements made at the Union Station at St. Louis to accommodate the visitors to the great Exposition, the Education Building at the Louisiana Purchase Exposition—one of the most dignified buildings in the group; the designs placed second in the competitions for the West Point Military Academy and for the Indianapolis Post Office and United States Court House; and their studies for the improvements of Lindell Boulevard and the Park View Realty Tract near the grounds of the Exposition, which is a town-planning problem developed in 1903, comprising a group of 125 hotels and apartment houses, all of which were so planned that every room in every building overlooked a garden.

Both members of the firm were born in the State of Michigan and studied at Boston, Massachusetts, and also travelled and studied in Europe, Mr. Young having been a pupil of M. Daumet at the Ecole des Beaux-Arts, Paris. Both have long been prominent workers in the upbuilding of the American Institute of Architects. Mr. Eames was a Director and Vice-President for two years, and was twice elected, in 1904 and 1905, President of the American Institute of Architects. Mr. Young has served on several committees and as Auditor to the Institute. During the terms of his presidency of the American Institute of Architects Mr. Eames was largely instrumental in bringing about an amicable understanding between the United States Government and the professional architects between which friction had occurred as regards amount of fees and also to the demands of the latter that Government buildings should be designed by responsible architects, not by Government employees. Another important office which came into his care was the purchase and maintenance of the Octagon House at Washington, which is now the official home of the Institute. It is fully paid for and free of any encumbrance.

An illustration of the Realty Improvement Scheme, St. Louis, appears on p. 363, and other examples of the work of Messrs. Eames & Young are shown on our plates.

THE OFFICE OF THE PUBLIC TRUSTEE.

The increasing business which is falling to the Public Trustee has necessitated new accommodation for the staff of the department, and, pending the erection of the building in Sardinia-street, temporary rooms are to be provided in a wood and iron building to be placed on the lawn of Clement's Inn.

native or innate beauty and interest will replace superficiality, and a sense of texture in material and suitability in form will follow. Brickwork can be beautiful both as material and workmanship, stonework in adaptability and freedom of treatment, slating in pattern and quality, carpentry framings and joinery in direct expression of construction.

Full acquaintance with the nature and uses of the materials for which he has to prepare designs, or more exactly in which he designs, is of fundamental importance to an architect. A slight general acquaintance will not be sufficient to ensure the technical sympathy which is recognisable so seldom, but is of such value. A certain knowledge that does not mistake the quality and peculiar beauty of each material is needed, so that the problem of the design may ally itself directly with the medium of its construction. This harmony, having very much to do with architectural beauty, sound and ingenious construction, will be quite readily seen to have intimate connexion with a right and sympathetic use of material. Constructive skill in unsuitable and unlovely material is as inharmonious as beautiful form badly constructed in a fine material. The art which employs materials successfully in building is as real as that which constructs with permanence and economy. Without construction, building is impossible; but unless exercised in suitable materials, with a proper sense of their nature and serviceableness, fine architecture is equally unattainable.

The study of materials is primary to the architect, then the study of construction and purpose, followed by such æsthetic considerations as have not been evolved in their progress through an artistic mind. The impressiveness, which is architectural, in the Temple of the Sphinx has its main sources in these three primary streams; they here combine in a building that owes nothing to what is commonly regarded as architectural detail or to æsthetic considerations. Dignity, fitness, and security are expressed alike by the material, construction, and arrangement.

Material, though a constructive element, has, however, an æsthetic quality if it governs, as it should, the genesis of the detailed form. It imparts the quality of texture, so little understood in English practice. The general tendency here is to confuse it with the decorative values of materials, which lie solely in their superficial colour or polish. The æsthetic value of a building material, however commonplace its nature, is to be expressed by its use and workmanship, form deriving character from its natural qualities; and without this æsthetic expression of the texture of material the finer effects of architecture cannot be realised. Into the appreciation of building texture costliness or intrinsic beauty, such as that of marbles, veneers, or of colour veinings or contrasts of richness, do not enter; this decorative aspect of building materials has little to do with the essence of architecture, though one of the first among those many accessories conveniently described as "handmaids." The same considerations which govern the decorative painting of interiors apply generally to the use of materials for their colour or superficial value. Though the student of building construction can be safely advised not to concern himself with these for a while, he cannot undertake as an architect the sympathetic study of materials, for the purpose of designing with them, with no other sense of texture than that which recognises the similarity of red Mansfield stone with red brick, and employs them in juxtaposition to express their common red characteristics. A true perception of texture as a constructive and artistic quality will endow the use of our ordinary building materials, whether employed in important, and great works or in such humbler things as warehouses, cottages, or even garden walls, with direct interest and beauty. The student may assure himself that, if the texture of each material and its related craft is thoroughly comprehended he will have at hand a fountain of simple beauty which will give new vigour to design, and which will, besides, place for him the study of ornament upon a new and vital basis. Pseudo-architectural forms which are lifeless apart from their original purpose and material will be replaced by the new stimulus of seeking to express the possibilities and quality of the modern material in his hands.

Will beauty of form, however, attend upon beautiful building construction? It will be fairly obvious to a generation such as ours, reared into a general sense of architectural fitness by education in the mixed particulars of illogical standards of taste, that it will not be so. As a matter of course, to such any beautiful architectural forms must be derived from some extraneous source and applied to the building, as it would be impossible, for a dilettante, to conceive of building construction as otherwise than Philistine and ugly.

If this prevalent view is correct and to be maintained by education, we must have a new term for beauty in architecture, beautiful architecture and beautiful building not being identical and not necessarily connected. It is a consequence of this prevalent view that building construction books and those on architectural history proper have dealt with apparently different subjects, the former with the matter-of-fact necessities of building, and the latter with the forms which impart architectural beauty. This conclusion, I fear, represents the state of the case in the minds of present-day authorities; the grouping of subjects and books, schemes of architectural examination and of education leading thereto seem to have as their basis the segregation of the arts of design from the practice of construction. The student is expected to sort himself either as a constructor or artist, and nourish his bent accordingly, and in either compartment he is secure from becoming a great architect.

A definition which seeks for intellectual expression in building construction as the secret of true architectural beauty will almost satisfy the inquiry as to the relation of beauty of form to building art. Refinement and adornment follow upon this premise, and it need not be considered that the bare requirements of an enclosing construction is all the building art allows. The Great Pyramid, the Parthenon, the Pantheon, a mediæval vaulted cathedral, or a Renaissance dome each exemplify the operation of trained intellect on constructive problems.

It would be an affection to suggest that books or lectures dealing practically with the needs of a student of building could impart the art of architecture, but it should be claimed that the student of construction should discern the elements of architectural beauty in that subject, just as in the study of beautiful buildings they should be attracted to their fundamentally architectural construction.

The purport of this introductory address is fulfilled in pointing out that the studies of the architectural student should concentrate upon the motives and materials of construction as true sources of varied streams of interest and beauty. Apart from passing fashions, these make architecture permanently effective. Underlying my purpose has been the hope of linking ancient reference with present practice by a linked study of historical buildings, in order to avoid such a concentration of attention on modern use in construction as would relegate precedent to what would improperly be called the artistic side of the architecture. A very narrow view of artistic architecture only would either profess disregard for the modern sense in construction or the ancient in form; the true view equally observes both in each; the artistic architect and the practical builder are not properly separate entities or corporations.

This basis of study is the ideal for the architect; to illustrate and prove it would be easier from the standpoint of a review of past works of architecture than of the means now at hand of achieving fresh ones, but the present is the most living force with which the student will have to engage, and modern architecture having nothing wherewith to express herself but building construction, to us the more necessary study shall have the more abundant comeliness.

Of other forces, of the power of the past, of the aspirations of pure artists who were not constructors, we may be led to speak later in dealing with the historical progression of building experiment.

A DECEASED BUILDER'S ESTATE.

The late Mr. Joseph Waterhouse, of Keighley, builder and contractor, formerly mayor and alderman of the borough, has left estate valued at 40,583*l*.

ARCHITECTURAL SOCIETIES.

The Northern Architectural Association Visits to Stella Hall and Axwell Hall.

An interesting outing arranged in connexion with the Northern Architectural Association was held on Saturday afternoon, when members paid a visit to Stella Hall, the residence of Mr. Joseph Cowen. The party were met at Stella Hall by Mr. Joseph and Miss Cowen, who conducted their visitors over the historic building and explained many features of interest. Mr. Cowen explained that Stella Hall was a religious house in the time of Edward the Confessor, but there were no authentic data until about 140, when the hall was graced by the Bishop of Durham to the nuns of St. Bartholomew, who had a nunnery in Newcastle. Stella Hall remained a nunnery until the time of Henry VIII., after which it passed into the hands of the Tempest family. Lord Widdrington subsequently became the possessor, and later the Townleys, from whom it was at present leased. Stella Hall was still in the form of a cross. The last material alteration made to the building was executed by Mr. John Dobson over forty years ago. The party afterwards drove to Axwell Hall, which was erected about 100 years ago from the designs of the late Mr. James Paine.

GENERAL NEWS.

Professional Announcements.

Mr. W. H. Ward, A.R.I.B.A., has removed from 28, Theobald's-road, to 2, Bedford-square, W.C.

Mr. Campbell Jones, F.R.I.B.A., who has for many years carried on his practice at 32, Bedford-row, W.C., has moved to Skinner's Hall, 9, Dowgate-hill, Cannon-street, E.C.

Orme-square, Bayswater.

This freehold property, now offered for sale, consists of twelve houses, around three sides of a garden, whose estimated rentals amount to nearly 2,600*l*. per annum; the area extends to 73,340 ft. super., with frontages to Bark-park and St. Petersburg-place, and one of 281 ft., on the open side, to Bayswater-hill. The pleasant retreat and garden, one of the last after its kind in the town, was laid out on the site of one of the Kensington gravel pits in 1815 by Edward Orme, who built the houses, together with one for his own occupation, at irregular intervals. Orme, a descendant of the old Cheshire family, was print-seller to George III. and the Prince Regent, trading in New Bond-street. He bought the land, and also built Bayswater Chapel-of-ease.

—now St. Matthew's Church—in St. Petersburg-place, Nos. 1 and 2 in the square were the homes respectively of Sir Rowland Hill and Frederick (Lord) Leighton.

Victoria and Albert Museum.

In his report for 1909 and 1910 Sir Cecil H. Smith, Director and Secretary, refers to the great increase of the prices realised by works of art in recent years, which, he says, renders the problem of acquisition by purchase one of serious moment; the inflation of auction-room prices practically leaves public institutions, with their strictly limited means, deprived of any chance of success in open competition. There were 718,921 visitors to the Museum in 1909, and 967,592 in 1910, including 98,368 and 138,071 on Sundays respectively.

Rebuilding of Messina.

The new rules for the rebuilding of Messina permit the adoption of various systems of construction with the proviso that every building shall have a frame of iron, timber, or reinforced concrete; but frames may be dispensed with for masonry buildings of only one floor not more than 5 m. high and with walls whose thickness is not less than one-eighth of their height. Cornices and balconies must not project from walls more than 40 cm., and 60 cm. respectively; terraces and roofs must not be heavier than 50 kg. and 45 kg. per square metre; cast-iron for columns and general structural work is prohibited. The height of the houses must not exceed the width—a minimum of 10 m. or 8 m.—of the street; buildings must not be higher than 10 m. to the eaves, though for churches and public buildings the limit is

6 m. A sum of two millions will be expended upon the Government buildings, for which are to be used masonry blocks and lime and pozzolana from Bacoli, with steel framework. The plans comprise improvements of the harbour and extension of the sea-front and road 100 m. wide alongside of the quays.

Ashton, Northants.

Mr. Charles de Rothschild, of Ashton Hall, near Oundle, has in effect rebuilt the village by replacing all the old thatched cottages with substantial buildings of stone, in pairs, with gardens all round them. The cottages are let to the labourers on the farms and state at a rent of 1s. 1d. per week. Each has two ground floor rooms and three bedrooms above; the front living-room is large and well lighted, and fitted with a cooking range, beyond is another room with a second range and a hot-water bath.

Australia and the Island Site, Aldwyck.

The Parliament in Melbourne will in a few days hence have before them the project for purchasing the island site in Aldwyck for the new offices of the Australian Commonwealth and the six States. It is understood that the London County Council will part with the freehold of the land, and that the scheme will involve a total outlay estimated at some 50,000. The entire site at disposal covers an area of 24,360 ft. super, inclusively of the leasehold portion on which now stand the offices of the Victorian Government.

St. Albans Abbey Church.

The project for the substitution in St. Albans Abbey Church of a stone groined roof to the north aisle for the plain oak roof that now covers it has been placed before Mr. J. Oldrid Scott, who has prepared plans and drawings and an estimate amounting to 5,000. has been given.

Art in the Borough.

At the Borough Polytechnic, where the pavement is being rebuilt, an interesting experiment in decoration is to be seen. One of the large ground-floor rooms, used chiefly for recreation purposes, has been taken in hand by a band of artists and decorated. That is to say, the walls have been covered with a series of seven paintings representing a spirit of modernity some of the pastimes of young Londoners. There is a strong Post-impressionist flavour in the scheme, due, of course, to the influence of Mr. Roger E. Fry, under whose direction the work has been done. The intention of the series is humorous, and, apart from the technique, there is considerable attractiveness in the compositions. Mr. Fry himself contributes a panel, skillfully designed for its position, in which the measures of elephant riding are suggested without a visit to the Zoo. Mr. Albert Johnston shows us a seaside idyll, and Mr. Duncan Grant, with some originality and considerable decorative charm, gives a pictorial demonstration of swimming. Mr. Max Gill portrays a "Punch and Judy" show. The most amusing of all, however, is Mr. F. Etchell's view of social life on Hampstead Heath—a Bank Holiday aspect.

The colour scheme of the series is gay, and we are not altogether enamoured of some of the designs, there is an enlivening touch throughout the compositions. Painted in flat tints, and executed in a few weeks at a total cost of 100., these mural decorations, if not in accordance with the accepted traditions of decorative art, will serve the purpose of the institution, which is to brighten the thoughts of the people.

Church Extension in Cleveland.

The committee appointed by the Archbishop of York to report on the needs of the Church in Middlesbrough and Cleveland considered that the following sums were urgently required—towards the payment of existing debts, 4,961.; towards the provision of sites, 3,772.; for the erection of mission churches, 4,550.; for the erection of parish halls, 2,650.; for the erection of parsonage houses, 1,600.—16,058. Other schemes—not so urgent as the above, but, in the opinion of the committee, necessary—will involve an expenditure of an additional 4,000. at least. The Archbishop has felt himself justified in issuing an appeal for 20,000., substantial contributions to which have been received already.

The House of Commons.

A new system of drainage is being placed in the House of Commons under the direction of the Office of Works. It is expected that the work will be completed before the re-assembly of Parliament.

An Open-air Bath, Cardiff.

Adlerman John Chappell, presiding over the Cardiff Parks Committee, introduced the question of an open-air bath at Llandaff Fields. He suggested that the scheme be taken in hand without delay, and that shrubs be planted on its slopes, so that a revenue might be secured from bathers next year. There had been serious congestion at Roath Park Lake bathing boxes this year, and although 44,000 people had passed through the turnstiles, hundreds of people had to be turned away. He dared to say that 80,000 persons had been bathing in dangerous places during the same period. In order to relieve the congestion he advocated the provision of an open-air bath in Llandaff Fields.

Bishopsgate Institute.

The Institute, whose enlarged reference library will be reopened in the course of October by Lord Rosebery, has been enriched by the acquisition of the library of the late Mr. George Howell, M.P., comprising some 6,000 volumes on social and economic questions, purchased by his friends at a price of 1,000., an offer to buy them having been made from America. The Institute library, we may mention, possesses an unusually large and varied collection of works upon the history and topography of London.

Travelling Facilities to Tooting.

It is hoped by residents in Lower Tooting that new means of transit may be established to supplement the existing tramway service. It is suggested that the City and South London tube, which now ends at Clapham Common, should be extended to Balham, Tooting, and perhaps to Wimbledon. Another idea is that the London, Brighton, and South Coast Railway should build a station at Merton Bridge and increase the railway facilities.

A Glasgow Fire.

It has been widely stated that the warehouses of the Scottish Wholesale Co-operative Society in Glasgow, which were partially destroyed early this month, were built from designs placed second in the competition in 1882 for the Municipal Buildings. This is an error. Messrs. Bruce & Hay were the architects of the damaged warehouse, while the firm placed second in the Municipal Buildings competition, won by the late William Young, were Messrs. Hall & Taylor, of London.

The Ordnance and Geological Surveys Report for 1910.

The Director-General has just issued his report for last year. A special revision to facilitate the valuation of land is being made, and in advance of their normal turn, of the maps of those areas around towns where the details have been greatly changed during recent years. No maps are now produced at the nation's cost to a scale greater than 25 in. to the mile; the old town maps to scales of 5 ft. or 10 ft. to the mile are revised by the Survey at a charge of from 15s. to 20s. per acre. All the 6-in. and 25-in. maps are printed from photographic zinc plates. The coloured 1-in. maps are lithographed, transfers being taken from the copper plates, graven by hand, used for the 1-in. uncoloured maps. On the geological side a large portion of the kingdom is mapped to the 6-in. scale, and maps of the whole country are made to scales of 1 mile, 4 miles, and 25 miles to the inch; the explorations below surface are carried out by the Geological Survey, in three parties of six geologists, with collectors of fossils, and photographers, apiece. The maps are plotted and printed by the Ordnance Survey, who use, for the most part, colour printing in yellow, blue, and red—six inks yielding some 900 tints. The census-taking in the current year, the Wreck Register, the transfer of the telephone service of the National Company to the State, and the land-tax schemes of the Government have greatly increased the demands upon the work and output at Southampton.

The Stort River Navigation and Lea Conservancy.

The Lea Conservancy Board have ratified their purchase from Sir Walter Glibbe of the Stort River Navigation, which, as the River Stort, separates Essex from Hertfordshire. The Navigation extends from Bishop's Stortford into the Lea, and enters the Thames by way of the Lea Cut from Bromley at Limehouse. The water supply is gained chiefly from springs at Elsenham and from small affluents along its course, on which are fifteen locks, 13 ft. 6 in. wide, and from 3 ft. 3 in. to 4 ft. 6 in. deep throughout. The Board intend to repair the locks, banks, and bridges, and to adapt the river for the passage of barges of 65 tons burthen.

Metropolitan Sewage System.

To-morrow (Saturday), at the Stonebridge Outfall Works, Mr. H. Mallaby-Deeley, M.P., will open controlling valves and thus link up the sewers in the Brent area of Willesden with the Metropolitan main drainage system. The ceremony will take place at three o'clock.

University of London: British Museum and Victoria and Albert Museum Lectures.

Mr. Banister Fletcher, F.R.I.B.A., will commence a course of twenty-four University Extension lectures on "Ancient Architecture," at the British Museum (by permission of the trustees), on Tuesday, October 3, at 4.30 p.m. Also a course of twenty-four lectures on "Renaissance Architecture" at the Victoria and Albert Museum (by permission of the Board of Education), on Monday, October 2, at 5 p.m. These courses are to be fully illustrated by lantern slides, photographs, diagrams, and models, while the museums, which seem the natural home for a series of such lectures, abound in ancient and Renaissance examples, which will be visited and explained by the lecturer during the class held at the end of each discourse. Particulars may be obtained from Miss Gaudet, 120, Cheyne-walk, Chelsea, S.W.

University College.

The new session in the Faculties of Arts, Laws, Science, Engineering, etc., at University College will be opened on October 2. On October 12 Mr. E. S. Prior, F.R.I.B.A., will deliver the first of a course of Carpenters' Company lectures upon English medieval architecture.

Central School of Arts and Crafts.

The teaching in the architectural classes in the Central School of Arts and Crafts is arranged to enable students to qualify for the examinations held by the Royal Institute of British Architects and other professional examinations, as well as qualifying for the National Competition, the I.C.C. Art Scholarships, and for admission to the School of the Royal Academy of Arts. The classes are now in progress, the subjects including architectural design and drawing, building construction, structural mechanics, letter cutting in stone, wood carving, ornamental leadwork, ironwork, and bronze casting. Mr. S. B. Caulfield, F.R.I.B.A., Mr. F. H. Mansford, Mr. P. J. Waldiam, and other qualified teachers are associated in the work of instruction. On Wednesday evenings a course of lectures is given from 8.15 to 9.30, the growth of a house being explained. The whole of the details, including site, drainage, hot water supply, etc., will be considered. A Saturday afternoon class will be held from 2.30 to 5 at the Victoria and Albert Museum, where examples of old work will be studied.

School of Art Wood-Carving.

The School of Art Wood-Carving, 39, Thurloe-place, South Kensington, which is under royal patronage, has been reopened after the usual summer vacation, and we are requested to state that some of the free studentships in the evening classes maintained by means of funds granted to the school by the London County Council are vacant. The day classes of the school are held from ten to one and two to five on five days of the week, and from ten to one on Saturdays. The evening class meets on three evenings a week and on Saturday afternoons. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the Secretary.

Northampton Institute, Clerkenwell.

The announcements for the session show that a variety of subjects of practical and theoretical importance may be studied at this polytechnic. In the electrical engineering department the new generating station, which was opened by the Chairman of the London County Council last winter, is now available for the instruction of senior students in both day and evening courses. The equipment of this station is very complete in all details of the generation and distribution of continuous and alternating current. In the mechanical engineering department the equipment for experimental work in aeronautics has been much increased. Various classes are held, in which instruction is given in craftsmanship and other artistic work.

Lectures on Electric Lighting.

Two popular lectures will be given by Mr. Frederic H. Taylor, A.M.Inst.E.E., A.M.Inst.M.E., on "Recent Developments in Electric Lighting and Other Applications of Electricity," on October 4 and 6 next, commencing each evening at 8 p.m. Tickets may be had on application to the Secretary at the Willesden Polytechnic, Priory Park-road, Kilburn, N.W.

The Gas Fire.

The question of heating buildings, domestic and otherwise, has engaged the active attention of architects for many years, and particularly in London—the "city of fogs"—where the damaging effects of the "smoke nuisance" are so manifest, this activity has of late largely been devoted to studying the question from a more scientific aspect than hitherto, i.e., not merely from the point of view of obtaining heat and that only, but of obtaining it in its most convenient and hygienic form. Of late years, in this country especially, where the vagaries of the climate have been so marked at all seasons of the year, the coal fire has to some extent fallen out of favour, for the simple reason that it is not possible to adapt that means of heating to the varying temperatures to which we are subjected, and, as a consequence, a system of heating that is always instantly at the will of the user is becoming more widely known and adopted day by day. We refer to the gas fire. This means of heating has found a good deal of favour with those who are in a position to appreciate the advantages to be gained thereby. The work that the largest metropolitan gas company have undertaken in offering to architects the free fixing of gas fires for a trial period may induce members of the profession who have not had personal experience of modern gas heating to take this opportunity to study the subject more closely. If they do, it may lead to their advising the still wider adoption of this system of heating.

Nottingham Building Society.

After the fifty-seventh annual meeting of the Nottingham and Midland Counties Permanent Building Society, held a few days ago, it was decided that in future the title of the association should be the "Midland Counties Permanent Building Society."

A GATE AT HATFIELD.

Our illustration presents a gate in the gardens of Hatfield, to which our attention has been called by Mr. Robert Falconer. The measured drawing is by Mr. J. Starkie Gardner. It was brought to its present position from a neighbouring park, and the initials are those of a baronet, who died before 1689. Its interest lies in the fact that it was produced before the Frenchman Tijou's work so profoundly influenced the art of ironworking in England, there being many reasons for believing that he was not here before the arrival of William and Mary. These are set out at length in Mr. Starkie Gardner's forthcoming book, which not only deals exhaustively with the work of Tijou, but also with that of his successors, as well as with that of his purely English rivals, whose names even have hitherto been unknown to us.

Notwithstanding all researches, the real fashion of the richly-worked iron gates of Charles and James II., mentioned by contemporary writers, remains quite unknown. The gates before us, though naive in design, present many of the characteristics of the later English school, which developed side by side

with Tijou's richer and more florid style. They may even show that he was perhaps not so wholly uninfluenced by the ironwork he found in England on his arrival, as hitherto supposed, but this, however, opens up a question which cannot as yet be profitably discussed.

COMPETITION NEWS.**Library at Clydebank.**

The designs of the fifteen architects chosen to compete in the competition for the Carnegie public library at Clydebank have been considered by the assessor, Mr. James Miller, A.R.S.A., who has awarded the first premium (50%) to Messrs. A. McInnes Gardner and Robert Whyte, the second premium (30%) to Messrs. Stewart and Paterson, and the third premium (25%) to Mr. Charles Menart, all practising in Glasgow.

Düsseldorfer Extension.

On p. 365 full reference is made to this competition, which is open until next July.

Cottage Hospital, Skegness.

In this competition Mr. Ernest R. Sutton, F.R.I.B.A., of Nottingham, was the assessor, and he has awarded the premium (15l. 15s.) to Mr. F. J. Parkinson, of Blackburn. Messrs. Moore & Archibald, of Middlesbrough, and Mr. Josiah Auty, A.R.I.B.A., of Morley, were placed second and third respectively.

BOOKS.

English House Design. By ERNEST WILLMOTT, F.R.I.B.A. (London: B. T. Batsford, 94, High Holborn. Price 10s. 6d. net.)

If architects generally have had some reason to complain of a lack of public appreciation and recognition, and have felt, at times the disheartening sensation of playing to empty houses, at any rate the designers of domestic work are not without encouragement. For

them the house is always full and the applause spontaneous and generous if, as might be expected, a little indiscriminate at times.

This widespread and increasing public interest is responsible for the making of many books, and the very fact that there are many has prompted Mr. Ernest Willmott to write another. It occurred to him that might be helpful if the material already collected could be "sifted and collated" in a form which would enable those who have little technical or historic knowledge of English domestic architecture to appreciate the character of its modern tendencies and to understand something of the principles upon which the design that is best in them is based.

The method adopted is to state briefly a few general principles to which all good design should conform, and then to note the application to the examples—both ancient and modern—chosen for illustration.

In order to define and explain the position in English architecture of the examples cited, the author has found it desirable to deal with them historically. A most interesting chapter reviews such questions as development of the old English house, arrival of the Renaissance, the fusion of old methods and the new motives, and survival of the earlier traditions in the smaller houses. The next chapter deals with Revival, illustrated by the work of Philip Webb, Bodley and Garner, and B. Norman Shaw, and leads to a selection of contemporary designs which appears to be fairly representative.

The book is intended to appeal not only to the architect, but to all those who, taking general interest in the subject, wish to know more about it and to reconcile their taste with their understanding.

We welcome this timely and admirable attempt to effect this reconciliation most heartily, for it may be confessed that many of the previous works on English architecture are rather by way of being picture books, which, however useful as books of reference, or as drawing-room talk

**A Gate at Hatfield.**

Measured Drawing by Mr. J. Starkie Gardner.

aments, make little appeal to the understanding.

Although it may be too soon to attempt sum up the whole meaning and effect of the Gothic revival, it seems fairly clear that, at any rate, we owe to it the present recognition of the value of good materials and the need for sound and artistic craftsmanship in using them in a way that is characteristic of their nature. From the author's interesting remarks on texture and quality of surface we gather that the simpler the design the fewer and simpler its features—the more expression of the whole is dependent on quality and the treatment of the materials, whereas in buildings where "purely architectural quality obviously plays a more prominent part," where the features are many and elaborate, the surface texture of the material is no longer of such a vital importance.

If we must find some point to criticise in an interesting book we should be inclined to take exception to parts of Chapter III, particularly to its title—Concerning the Chief Principles of House Design—which we think liable to mislead. These principles we find enumerated as repose, proportion, scale, rhythm, colour, texture, etc.

It is not simply a concern for pendant accuracy of expressions which leads us to say that we should have thought it more accurate to describe them as qualities, not as principles. Qualities inherent in all good designs which are the outcome of the proper application of the right principles of design, but not the principles themselves. Indeed, we notice that the author himself refers to them elsewhere as qualities.

On principles, we take it, is generally understood to be more in the nature of a precept, a code of conduct to be pursued, a course of action to be taken towards a desired end.

Anyone, therefore, who might reasonably expect from the title of this chapter to find principles explained whereby these desirable qualities could be obtained would be to his extent disappointed, for to enumerate qualities of a flower, its form, its colour, its perfume, is not the same thing as to explain the creative principle governing its organic growth. While an exhaustive analysis of the elements of such qualities as proportion and rhythm, and the conditions under which they occur may do something towards

Newton St. Cyres, Crediton, Devonshire.

From Mr. Willmott's "English House Design." (B. T. Batsford.)

helping the student to formulate for himself the principles which govern the organic growth of a building, by means of which the desirable qualities of proportion, rhythm, or repose may be obtained, we cannot help feeling that the author's sense of the impossibility of entering into philosophical discussion may result in giving an impression that he is a little too ready to refer these abstract qualities back to our natural sense of the fitness of things—as if everyone's sense of the fitness of things was always an infallible court of appeal; whereas his readers might welcome some further explanation of the relation between these abstract qualities and the practical requirements of the building, which explanation need not lead us far "into the region of metaphysics."

When, for instance, the author asks, "To what, then, is this quality of repose due?" and proceeds, "This is not an easy question

to answer in a few words. Like human character, it is the cumulative result of many influences. We find this quality in a simple block of old farm buildings where evidently no self-conscious effort has been made to achieve any particular effect, just as we recognise a beauty and strength in the character of many simple folk who are probably totally unconscious of ever having deliberately cultivated a single virtue," it seems to us that he succeeds in a very few words in supplying a good working answer. The repose is there because "no self-conscious effort has been made to achieve any particular effect."

After this suggestive and, as we think, helpful explanation, to be told that "we may not be able to say why it (repose) is there any more than we may be able to say why a certain arrangement of notes produces harmony and another discord," but that the healthy eye recognises it just as the healthy

The Double-Cube Room, Wilton.

From Mr. Willmott's "English House Design." (B. T. Batsford.)

Cottage at Croyde, N. Devon.

From Mr. Willmott's "English House Design." (B. T. Batsford.)

ear recognises harmony, seems to be making rather an unnecessary mystery of it all, which tends to defeat the object of the book, for people are most readily interested in that which they can most easily understand.

When, again, in discussing proportion he imagines a room 8 ft. square and 20 ft. high, and remarks that it is immediately apparent that there is something wrong with that room, that it is too high for its area, it would have been more interesting and useful if he had told us why, and, instead of referring it back to our sense of the fitness of things, had pointed out that the bad proportion is only immediately apparent because we happen to know the nature of the room—a room for domestic use in a private house—and that the lofty proportion is not the natural outcome of the practical requirements of the room, and does not create the internal æsthetic effect which is the characteristic expression of its nature and purpose; and that if we had not known this we should not have been in a position to judge whether the proportion was good or not.

We gather that the author does not wish us to think that there are any fixed or arbitrary rules of proportion equally applicable to interiors of every character, or that it is not possible to imagine an interior to which the proportion of two and a half cubes in height would be appropriate and pleasing to the eye, when it produces the æsthetic expression characteristic of that particular interior.

There also seems a danger in the way the subject is treated that the layman or the student may carry away the idea that such qualities as proportion or rhythm are consciously, or even arbitrarily, applied to satisfy the "spiritual element" after the material element has been provided for, instead of realising that these qualities are the unconscious and inevitable results of the organic growth of a structure that is created by an artist in conformity with principle.

Although the author clearly shows how intimately the quality of proportion is connected with every structural detail of the building, yet he thinks this is the engineer's outlook—the accomplishment of a purpose by the most direct means—and that "it is only after the dictates of constructive propriety and of practical expediency have been satisfied that the element of proportion begins to enter the field of art, and it is in the varying degree of the refinements then exercised that the quality of the artist is discerned."

Making all allowances for the general tendency of its context, this sentence is difficult to follow. On the contrary, it might be considered that the spiritual element of proportion should enter into and govern the design from the first conception of the idea; that its influence on the shapes and heights of each unit helps constructive propriety and practical expediency to express ideas and to satisfy the spiritual element; that its absence may lead to rooms two and a half cubes in height:

and that in the varying degree of the refinements then exercised the quality of the artist is discerned quite as much as in the after refinements of detail, which simply heighten and complete the spiritual satisfaction already obtained by the main structural proportions of the building.

It is impossible, however, within the limits of a review to do justice to every point of principle or method that is raised. That such points are raised is, to us, the chief value of such books. We recommend everyone interested in the subject to read it for himself. It is not too long, it is never dull, and it is profusely illustrated by photographs of good examples.

The Ancient Stained Glass of Exeter Cathedral. By F. DRAKE and J. M. DRAKE. (Exeter: Pollard & Co., Exeter. Price 1s.)

A VALUABLE and detailed account of the stained glass in Exeter Cathedral and its restoration—particularly as regards the choir—is given by this pamphlet, which contains reprints of two papers read before the Exeter Diocesan Architectural Society—the first in 1879, by the late Fred. Drake, who began the restoration, and the second in 1909 by his son, Mr. Fred. Morris Drake, who has continued the work. Much light has been thrown by the research of thirty years on what, at the earlier date, was still obscure in the history of the glass. The great east window, as built about 1300, had six trefoil-headed lights, which were glazed (1508-26) by Master Walker, believed to have come from Rouen, where the glass was bought. In 1539 the window was rebuilt in the Perpendicular manner and with nine lights, and Robert Lyon, of Exeter, was employed to reglaze it. The new lights at the top and in the centre are painted frankly in the style of his day with white instead of flesh-coloured faces and the halos in the same piece, and yellow stain is used in them. But the adaptation of the old lights to their new positions in the sidelights, three on each side, is of special interest. The old glass differed in shape and size from the new openings. The borders were cut to fit the cinquefoil heads as nearly as possible, and the added height had to be filled up by means of new bases and canopies. The former are in the contemporary style, but the latter show the craftsman deliberately archaising—an almost unique occurrence in mediæval art. In order to maintain harmony with the figures he gave their new canopies the rigid design, clumsy outlines, and heavy colouring of Master Walter's work sixty years earlier.

Mr. Drake gives many other interesting notes on the glass of this cathedral, and even has a good word to say for the notorious Peckitt, who carried out a drastic restoration of it about 1750. "For all his sins, glass painters should remember him kindly. He lived in a bad age; he had no access to good material, no one to teach him. In the face

of difficulties innumerable, he actually induced the resurrection of our craft. Although he did his best, in that XVIIIth-century slough of complacent ignorance, to feel his way towards the light. Where he sowed 120 years later, did the reaping, often, I feel with anything but gratitude towards him.

School Planning at Home and Abroad.

W. H. WENDE, Licentiate R.I.B.A. M.R.San.I. With numerous illustrations. (London: The Sanitary Publishing Company, Ltd., Fetter-lane, Fleet-street, E.C. 4. 1s. net.)

At the Twenty-fifth Annual Congress of the Royal Sanitary Institute at Brighton, Mr. Webb read an able paper on "School Planning," which was illustrated by a good many interesting plans of schools, and it is the paper, with the illustrations, which has been published as a booklet. Much of the paper appeared in our pages in our issue of October 1 last, and we are glad to call attention to the publication of it in this form, it should be of interest and value to those engaged in school work.

The Making of a Great Canadian Railway.

By FREDERICK A. TALBOT. With forty-three illustrations and map. (London: Seeley, Service, & Co., Ltd., Great Russell-street. 16s. net.)

THIS is the story, to quote the subsidiary title of the work, "of the search for a discovery of the route, and the construction of the nearly-completed Grand Trunk Pacific Railway from the Atlantic to the Pacific with some account of the hardships and stirring adventures of its constructors in unexplored country"—the pioneer survey, the scientific survey, and the construction. The book is not intended to appeal to the engineer, but to those who are interested in the romantic side of railway building have interests at stake, though there is good deal in the volume that cannot fail to be of interest and value to the young engineer. The chief actor in this history undertaking appears to have been Mr. Charles Melville Hays, the President of the Grand Trunk system, and the author gives detailed information showing the manner in which "an idle thought [by Mr. Hays] evolved into the most stupendous railway constructional enterprise in the history of the iron road. To undertake 3,543 miles of first-class railway as one concrete project represents a colossal task, especially when it is recalled that at the time of its conception the population of the Dominion did not exceed 6,000,000 souls." Though the work is not intended to appeal to the engineer, we must not omit to mention that Mr. B. L. Kelihier is the engineer-in-chief of the Grand Trunk Pacific, Messrs. Foley, Welch & Stewart being the constructional engineers. It was resolved to make the railway a modern one, and the British railways, it is pleasant to note, were taken as "models," "the first cost" to be "the last cost." "The construction of the line was taken in hand in large stretches at a time, ranging in length from 40 to 100 miles or more. At intervals of every two or three miles the constructional camps for a small army of men, horses, and material, while ample supplies of food were stored to meet their requirements for six or nine months. In addition the section was subdivided into divisions ranging up to 12 miles in length, on which resident engineers were stationed. . . . Something like \$100,000, or 20,000,000, were being poured out every day to provide work for over 25,000 men who were engaged in the mighty struggle with rock, muskeg, and forest."

The volume contains a great deal of entertaining matter, including some amusing anecdotes, but we have no space for detailed notice. The author describes the many difficulties of the undertaking—not the least being the muskeg, or bog-swamp—which gives particulars of the Quebec bridge—the bridge before the disaster and the new design—about which readers of the *Builder* are familiar. In the 350 pages of his work, none of which is dull, the author has given an admirable and well-written account of an undertaking which will rank as one of the greatest that Canada has attempted; the undertaking is a great one, and it has been worthily described by Mr. Talbot.

Sunday Morning. By Johannes Bosboom.
(By permission of Messrs. Wallis & Son.)

Selected Pictures by Johannes Bosboom and William Maris. (The French Gallery, 120, Pall Mall.)

This is an illustrated catalogue issued by Messrs. Wallis & Son as a souvenir of the interesting Exhibition held a few months ago, and to which we referred in our issue of May 19, p. 605. Most of the reproductions are Rembrandt photographs, one of the pictures being "Sunday Morning," illustrated in this page. Bosboom had a fine sense of the pictorial qualities of architecture, and possessed draughtsmanship of a rare order.

MAGAZINES AND REVIEWS.

Some illustrations of gilt and leather wall hangings are given in the *Art Journal*, with historical notes. "It is difficult to-day to realise the immense importance in early times of gilt and decorated leather work as applied to wall decoration, for its eclipse during the XVIIIth century was complete, and its manufacture never became a national industry in England. Stamped leather for decoration lost its importance early in the XVIIIth century, and was superseded by painted ornament on leather, which continued in use for a long time for screens." The series of articles in the *Art Journal*, under the title of "Interiors of English Mansions," includes Boughton in Northamptonshire. "Boughton affords a most interesting study," writes Miss Jourdain, "while the earlier buildings and decorations which remain serve to illustrate the transition in style." Other articles deal with the Mortlake tapestries and the Thistle Chapel.

Some valuable hints on decorative design may be obtained from the photographs of

Chinese mirrors illustrating the first article in the *Burlington Magazine*. The article by Herbert Cescinsky on English lacquer work gives examples of cabinets and other pieces, exceptionally good in design. The book notices this month contain reviews of a large number of continental works of considerable importance to the artist.

In the *Connoisseur* will be found an illustrated article on the furniture in Sir Frederic Cowen's collection, a further instalment on the Salting collection, mainly dealing with bronzes and reliefs, and numerous notes of interest on works of art of various types and periods.

The *Studio* gives an important place to Professor Jiro Harada's article on modern Japanese Cloisonné enamels, illustrated by numerous examples of bowls, vases, etc. In the review of the National Competition of Schools of Art it is noted with satisfaction that the Board of Education now proposes to develop rather than curtail the resources of this method of encouragement for the designer, and that it is likely that the exhibition will in future be held in a convenient and easily accessible gallery. The students' designs reproduced in the article show much of a high degree of merit, and at times a really imaginative treatment, though at times we see a tendency to lapse into the hackneyed forms of conventionalisation so characteristic of the art school some ten or fifteen years back.

That well known art magazine, *Deutsche Kunst und Dekoration*, published at Darmstadt, has now a record of fifteen years, and the current issue shows that its sympathies remain wide. The colour plates include one after a picture by Hodler, a Secessionist whose work and Mr. Augustus John's is inspired by similar motives. Otherwise, the magazine is illustrated by numerous half-tone blocks in monochrome, all of good appearance, and these, in connexion with articles on various subjects, enable the reader to obtain an extended view of the arts in Germany. Professor Angelo Jank, of Munich, is a decorative artist of merit, many of his compositions dealing with hunting scenes and warfare. The sculpture of Professor Hoetger, of Darmstadt,

is interesting, one piece being evidently in emulation of the missing Monna Lisa. The architecture includes work by Professor Hermann Muthesius, Professor Von Seidl, Mr. Lutyens, Mr. Ino Campbell, and others. Various other illustrations are included of decorative work of all kinds. The new volume certainly opens well.

Mr. E. B. Chancellor's article in the *Nineteenth Century* on the architectural masterpieces of London concerns itself chiefly with the buildings of the XVIIIth century; but the more interesting paragraphs are towards the end, where Mr. Chancellor emphasises the prevailing ignorance of architects and their work in the following terms:—

"The ordinary amateur prides himself on knowing something of the characteristics of the old masters of pictorial art. He will point you out a Raphael or a Reynolds; a Cuypp or a Velasquez, with the assurance of a critic; even the more recondite masters will yield their mysteries to his indefatigable inquiry; but in the case of the masterpieces of architecture few appear to take the trouble to learn when they were erected or who were responsible for their design, and the man who would blush to be thought uninformed of the name of a well-known painter will be found light-heartedly acknowledging his ignorance of the architect of some building whose outlines have been familiar features to him all his life. I cannot but think that it is this want of knowledge in this particular phase of art that largely makes the removal of some architectural masterpiece an easy matter compared with the relegation of some notable picture to another country.

People will never stir a hand to preserve a thing unless they realise that it is not only an object of what is absurdly called sentimental value, but also an intrinsic part of the capital, and a possession as much worth preserving as a picture or a book. But when they do this, they will as stoutly defend what architectural remains we can still boast in London as they have done, on so many occasions, the masterpieces of pictorial art which would otherwise have been wrenched from our grasp. Were there but half as many amateur critics of architecture as there are connoisseurs of pictures, one would have comparatively little to fear in this respect."

The important international exhibitions at Rome and Turin have quite overshadowed the efforts made this year at Charleroi, where a by no means unimportant industrial exposition has been gathered together and pleasantly housed in tasteful buildings. This exhibition is described in an article in *La Revue Générale*, which suggests that it is well worth a visit from those interested in the mining and metal-working industries, the staple ones of the district.

Concrete has an editorial on the second report of the Joint Committee on Reinforced Concrete. Following this is an article by Mr. Lakeman on the construction of the Free Church, Hampstead, the work of Mr. Lutyens. The Canadian building regulations for reinforced concrete are instructive. Other short articles deal with various aspects of concrete construction in engineering and building works.

The *Electrical Engineer* signals its twenty-ninth year of issue by a reduction in price to twopenny weekly and by a simultaneous increase in the number of its pages. The current number describes the leading features of the Electrical Exhibition at Olympia.

CORRESPONDENCE.

Bureaucracy v. Competition.

SIR,—I have read with much pleasure your article on the refusal of the Scotch Education Department to allow the Aberdeen Education Committee to invite eight architects to send in plans for new buildings required by the Committee. You point to what is a very real danger to the future of our country, not only in architecture, but in every department of life. The whole system of government is slowly changing. The British idea of government as crystallised in Magna Charta and the Bill of Rights was for the public authority to see to things being properly done by others, not to employ public officials to do them. The true function of government is destroyed where instead of supervising it undertakes to execute. With the architect, engineer, and contractor the public officer is rightly engaged in supervising in the public interest, otherwise a second public authority is needed to supervise the first.

MARK H. JUDGE.

EDITORIAL SUMMARY.

The vandalism in connection with the Tattershall Castle fireplaces forms the subject of our leading article. It is suggested that a Minister of Fine Arts should be appointed, and that archaeological societies should supplement the work of the Royal Commission.

Mr. Gordon Craig's models and drawings for "Macheth" and other plays are considered in our second leader with reference to Stage Architecture generally.

Notes include: "The White Horse Cellars, and Hatchett's, Piccadilly"; "Heraldic Improvements"; "Municipal Improvements and District Committees"; "Houses versus Flats"; "Portinsale Bridge"; "The National Trust and Tattershall Castle" (p. 351).

Some information on the structural features of the Crystal Palace is given on p. 351.

"Contemporary Architects and their Work: Messrs. Eames & Young, of St. Louis" (p. 352). This appreciative article is contributed by Mr. Francis S. Swales, formerly chief designer in their office. Several of our illustrations are reproduced from drawings made by Mr. Swales.

Professor Beresford Pite's lecture at the Architectural Association on "Building Construction in Architectural Education" is reported on p. 355.

Book Reviews. (p. 358) include: Mr. Willmott's "English House Design"; "The Making of a Great Canadian Railway"; "The Ancient Stained Glass of Exeter Cathedral"; "School Planning at Home and Abroad."

A curious drainage question is discussed in our Intercommunication Column (p. 362).

"Sculpture in Civic Art" is the title of the first article in the Monthly Review (p. 363).

A translation of the conditions of the Town Planning competition at Düsseldorf is given on p. 365, with comment.

The scheme for a Memorial to King Edward at Shadwell, designed by Mr. Reynolds-Stephens, is described on p. 366.

To the Building Trade Section (p. 369) a legal correspondent contributes an article referring to "Builders and Extraordinary Traffic."

Law Reports (p. 372) include: "Howlett v. Harrods," and a case re the "Fees of a District Surveyor."

On page 374 the results are given of the competitions for a library at Clydebank and a Cottage Hospital at Skegness.

MEETINGS.

FRIDAY, SEPTEMBER 29.

Glasgow Architectural Craftsmen's Society. - Presidential address by Mr. James S. Boyd. 7.45 p.m.

SATURDAY, SEPTEMBER 30.

Hachey Institute, Dalston-lane - Demonstrations in Engineering and Science Laboratories. 6.30-9.30 p.m.

Glasgow Architectural Craftsmen's Society. - Visit to works of the Coltness Iron Company.

Institution of Municipal and County Engineers. - Western District meeting at Pimlico, Town Hall, 9.30.

MONDAY, OCTOBER 2.

Architectural Association. Opening address by the President, Mr. G. C. Horsley, F.R.I.B.A. 7.30 p.m.

MONDAY, OCTOBER 2, to TUESDAY, OCTOBER 10.

Royal Institute of British Architects. - The Ninth International Congress of Architects, Rome.

FRIDAY, OCTOBER 6.

Birmingham University. - Mr. Raymond Unwin's inaugural lecture on "Civic Design," in the Mason College Building. 5.30 p.m.

SATURDAY, OCTOBER 7.

Institution of Municipal Engineers (Yorkshire and Northern Districts). Meet at N.E.R. station, Leeds. 10.55 a.m. Visit to Messrs. Thomas Green & Sons, Ltd., Smithfield Ironworks, to the Headingley Electric (Water) Pumping Station, and to the new Filter Beds.

ILLUSTRATIONS.

American Architecture.

OUR three plates this week in connection with our "Contemporary Architects" series (p. 352) give examples of the work of Messrs. Eames & Young, St. Louis.

The Story of the Bridge.

This series of articles on this subject will be continued in our issue of next week.

INTERCOMMUNICATION COLUMN.

A Drainage Question.

SIR,—I am contending with the local authority that it is their duty to relay a combined drain which runs underneath my house, but their reply is that it "has received the sanction of the local authority, consequently the owners of the premises through which it passes are responsible for its repair and maintenance."

I have inspected the application of the builder for permission to lay the drain. This document is in the registers at the Town Hall; it was signed by the Surveyor to the Board of Works and also by the Chairman of the Board of Works for this district on April 26, 1876. My house is No. 70 in the street. A blockage was complained of between No. 70 and 72, and as the next-door gully is lower than ours it became flooded. Our sewage seemed to run away, but really it helped to choke them. We were successful in clearing by rods on two occasions, but the third attempt failed, and a notice threatening summons having been received, we called in a builder and opened up the drain. The choking was due to a down pipe breaking and falling into drain beneath. The inspector called and condemned the drain on account of its not being cement jointed and out of date. We then gave our builder instructions to cease, so that we might thrash out the question of responsibility.

The arguments urged by us that it is the Council's duty are:—(1) That the plan differs from actual state of affairs, showing 66 in combination at rear, whereas this does not appear so from what has been opened up; and that other drains from stable in rear (erected about 1880) are in existence, but not shown on plan, thus showing that the combination as it exists has not received sanction of local authority. (2) That prior to 1875 there was a garden where our shop now stands, and that the shop was added to the house at that time. This necessitated the opening of the drain to take the rain water, and it was then that the plan came into existence. The combined drain was neither reconstructed nor repaired. Thus it must have been laid many years prior to 1875, and that, apparently, the Council have no plans thereof. (3) That the drains are not such that they would have been approved by the local authority, seeing that the method of laying is contrary to the regulations in existence at that time.

On the 12th inst. notice was served that the Council would examine drains, and this they did at junction of house and shop. They found clay joints worm-eaten; no concrete, except round the rain-water pipes, which had been relaid about fifteen years ago. The Council replaced gravel and flooring as they found it.

To-day notice has been served complaining of "a leaky drain," and requiring us within seven days to "properly relay the drain in accordance with the drainage by-laws of the London County Council." If default be made, a summons will be issued requiring attendance before a magistrate. Our lease was only recently acquired, and will expire in about fourteen years hence.

Could you kindly tell me what attitude I should take up, and would you be so good as to answer the following questions? (1) When cement jointing came into force, and when made compulsory. (2) If we are, as the Council say, liable for the combined drain, whether we have any legal claim upon our neighbours, who are connected, to pay their proportion. (3) If we can cut our neighbours off and refuse to let their sewage pass through the drain beneath this house.

I am aware that if the Council relay the sewer we shall be compelled to renew (in accordance with London County Council by-laws) all the connections thereto, but are local authority liable for inspection chamber, manhole, vent pipe?

Dalston.

SUFFERER.

[*.* We have considered your questions as regards the combined drainage system connected with your house and should be glad to assist you; but we are unable to give purely legal advice through our columns, as to do so on a statement of facts which may be

imperfect through laymen not having perfect knowledge of important points might only involve them in litigation. We may point out to you that in the metropolitan area a combined system may have been sanctioned so long ago as January 1, 1856, as this seems to have some bearing on your contention, and also that not all deviations from the authorised plans serve to convert an authorised system of drainage into a sewer, although if the effect of the deviation or of an unauthorised connexion was to include other buildings than those contemplated in the authorised scheme that might serve to do so. We have not information enough before us to deal with all your questions. If the drainage of all three houses is defective, and if the system is a "drain" and not a "sewer," we should imagine the authorities would proceed against the adjoining owners as well, and the expenses would be apportioned; but in any event we should say you would not be entitled to cut your neighbours off, as they may have prescriptive rights. The extent of the work the local authority can demand we can express no opinion upon on the facts as stated. We should advise you to consult a good solicitor upon the questions involved, as a single interview may save you from embarking upon fruitless litigation, and in any case through him you may approach the local authority and your neighbours with a view to ascertaining, lessening, or sharing the liability.—En.]

Fungus and Boarding.

SIR,—Referring to the letter from W. E. D., the fungus is evidently dry rot. The favourable conditions for dry rot are damp, warmth, and the absence of fresh air. The position of the room in question suggests that the facilities for ventilation under the floor are inadequate. The remedy is to remove every particle of wood affected by the rot or showing any indication whatever of the fungus and burn it, well wash the walls and the sound woodwork adjoining with a solution of perchloride of mercury (corrosive sublimate), and provide ample circulation of air under floors before fixing the new woodwork. As he has substituted tiles for the wood floor, I would suggest that, the skirtings be of cement, as the wet from washing the tiles may help to foster the dry rot in the woodwork. An interesting leaflet was issued by the R.I.B.A. in March, 1910, which should be instructive to your correspondent.

Apprenticeships.

At the recent Social Science Conference in Dublin Mr. Lushington, barrister, read a paper, entitled "Shall Apprenticeship under Indenture be Compulsory?"

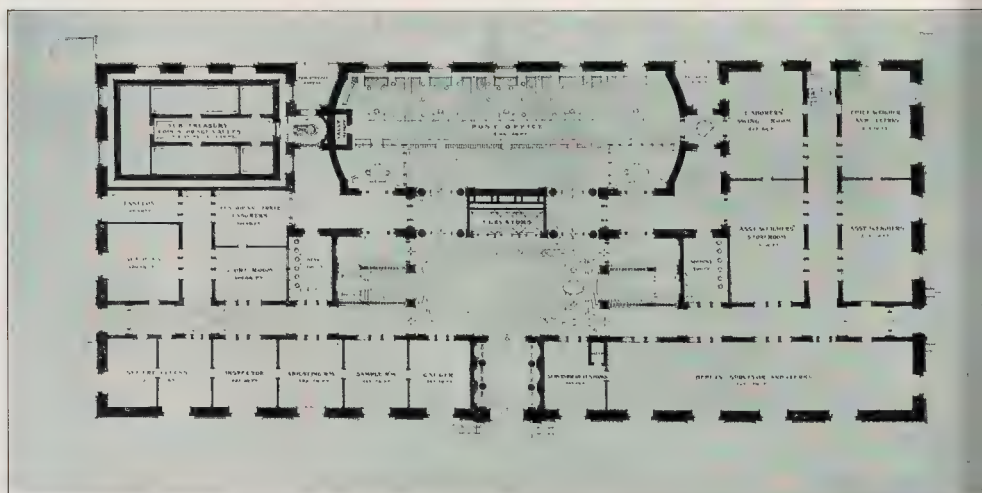

This apprenticeship question is one of great difficulty, and also one of considerable moment to the community at large. It is very certain that, amongst our large manufacturers and employers, a feeling adverse to indentured apprenticeships is rapidly spreading. The *Builder*, some time ago remarked upon the fact that in many of our large establishments and workshops apprentices have almost or wholly disappeared. The views of this class of employers have been ably set forth by Mr. Napier, of Glasgow, in a paper read at one of the meetings of the British Association. It is contended that under the old system, where boys are secured against the contingencies of trade and uncertainty of employment for a specified season, they acquire habits of carelessness and indifference, unfitting them from becoming superior workmen; whereas, by putting them upon their mettle, and giving them plainly to understand that present employment and future success depend upon the activity and attention with which they discharge their respective duties, a race of better educated and more ingenious workmen will be produced. As a proof of the correctness of their views the advocates of *unindentured* apprenticeships point to America where our old English system is unknown.

MONTHLY REVIEW *of* CIVIC DESIGN.

Park View Realty Improvement, St. Louis, 1903.
Messrs. Eames & Young, Architects.

PARK VIEW, ST. LOUIS.

WE publish this week an illustrated article dealing with the work of Messrs. Eames & Young, of St. Louis, U.S.A. (p. 352). The above design the lay-out of the Park View Realty Tract, set to the Exposition grounds, is an interesting and attractive example of their work in developing an independent estate of some size involving the consideration of many of the problems of town planning. The able manner in which the various apartment-houses are grouped so that each room looks out into garden has the added advantage of displacing with the enclosed court, which, though condemned by our sanitarians and encouraged by our municipal authorities preventing the free passage of air, is all too often a feature in similar schemes this country.

There is little doubt that the city of the future will avoid this feature—with interesting effects on our street architecture and the general lay-out. The problems to have been solved to some extent at the end of the XVIIIth century in Craig's plan for the lay-out of the more modern part of Edinburgh, where the blocks on either side of George-street give long continuous fronts, without any enclosed areas. By this means not only is a free circulation of air obtained, but it also becomes possible to place minor streets for mews, etc., in a shabby part of a town without their presence being observable from the principal streets.

Outside the Luxembourg, Paris.

SCULPTURE IN CIVIC ART.

Any mental conceptions of a city as a complete work of art in itself, an organic creation, must perhaps regard sculptural monuments in park, or street, or square as the final touch of æsthetic expression, such monuments holding the same relation to the complete design of the whole city as the sculptured decoration on a building does to the building itself. The means whereby the conscious mental and intellectual expression of the structural conception of the building acquires the added grace and charm of subconscious emotional expression, the last crowning grace of architecture, the flowers on the tree, the natural result of its perfection of organic structure.

As the tree must grow in uniformity with natural forces before the flower appears, and the building root itself in solid necessity and be evolved by hard mental stress in harmony with the law of gravitation before its structure can reach its final expression in the fine flower of sculpture, so it is in the city. Before we can introduce sculpture its environment must be there. We cannot brighten an expression which does not already exist. Before a sculptural monument can gather up and express more eloquently the prevailing sentiment of an open space or of a group of buildings the place must be laid out or the buildings grouped to express the same sentiment, or in deference to some ruling idea of which the sculpture may be the finishing and more vivid expression.

Town planning as a fine art, being now but at the beginning of a new Renaissance in this country, its technique has yet to be built up anew. Rightly it starts with broad principles of growth and structure, and concerns itself more immediately with stern necessity. If, then, we have not yet fully developed a school of thought, or laid down the general principles of the art or the technique of the method whereby the lay-out of open spaces or the grouping of public buildings can be made to express definite ideas or feelings, it is not to be wondered at that we have no very definite ideas as to the method whereby sculpture may be used to emphasise expression in any particular instances, or generally as to its place in a civic composition—its possibilities and its limitations.

We have yet to receive that help and co-operation from the sculptors which the subject demands. A few of the more gifted and intelligent of them have lately given some thought to the right treatment of sculpture on a building, and have realised that in conjunction with architecture it attains to complete satisfaction, but little attention has been given to the study of sculptured monuments in relation to their environment.

If we look to our past efforts in London for guidance in the art of placing statuary, this guidance is chiefly negative. Examples abound of how not to do it.

A most creditable statue of Oliver Cromwell is placed at the bottom of a sort of dry moat or bear-pit, with one of the bears—or is it a lion?—reclining on the not very creditable pedestal. Every savage, from prehistoric man downwards, as countless tumuli and other remains testify, knew better than to erect a monument to a departed hero in a hole. The natural instinct is to place it on a hill; to make

At Versailles.

what is high higher; to place the monument—if only a mound or a skull on a stake—where it can be seen and can impress the beholder. Oliver Cromwell might as well have been placed in the moat of the Tower of London.

A few yards away is the equestrian statue of Richard Cour de Lion, the position of which has no relation whatever to the open space in which it stands. Put away in a corner sideways and close up to the front of the House of Lords, dark metal against a richly-fretted stone background of the same

At Versailles.

general tone, it so entirely shrinks into its surroundings for lack of sufficient atmosphere around it to detach it from its inappropriate background that any merit it may possess is entirely lost. It is possible that not one in ten of those who pass by are even aware of its presence.

In the Thames Embankment-gardens the statue of Tyndall has an inscription, in small letters on its pedestal, but, being placed in the centre of a circular garden enclosure, no one can approach near enough to read it. Realising this, the authorities have thoughtfully placed a small wooden board on a post at the edge of the enclosure with the inscription on it, but it does not seem to have occurred to them that there was anything wrong with the surroundings of the statue or that it was designed to be more closely approached.

The outdoor sculpture of Paris and Versailles, as the illustrations suggest, can as a rule depend upon an adequate setting and suitable environment; a position in which the surroundings are to some extent in harmony with the sentiment of the sculpture. When that is not completely obtainable a sound technical knowledge of the due relation between architecture and sculpture, and the unity that fortunately exists in the various arts, ensures at least some general harmony of effect, and at any rate avoids the worst mistakes.

Such groups as we illustrate might be divided into two classes the recumbent figures and groups of children at Versailles,

and the isolated figures in the gardens of the Louvre or the Luxembourg.

The first are strictly architectural; deliberately arranged as part of the general composition with which they have an exact relationship of scale, material, and style designed to enhance and give the finishing touch to the expression of the general sentiment of the whole composition.

The rest are on a different footing. Designed for the most part as independent creations, expressing a complete idea, they need a background or a frame, a certain isolation from their immediate surroundings while preserving the unity of the general effect.

Usually such statues are housed in museums, as at the Louvre or Luxembourg, but by placing them in the surrounding gardens, not too intimately related with the architecture of the building itself, the necessary isolation is obtainable, and the

At Versailles.

statue obtains the most perfect setting, can be appreciated as an independent creation while at the same time adding much to the charm of the garden without creating discord or in any way interfering with the effect of the general design of the building and its environment. The result has all the advantages of an outdoor sculpture-gallery where each statue can be seen independently without clashing with its neighbour.

As the importance of the study of civic design becomes more fully realised, then we shall hope to see the proper relation

Sculpture at Versailles.

apture to its environment and the general
sion of its possibilities and limitations
civic art receive the attention of the
yal Academy and other schools of
ulpture.

otographs by Mr. F. R. Yerbury.

OWN PLANNING COMPETI-
TION AT DÜSSELDORF.

The following translation of the conditions
a competition for replanning the town of
üsseldorf, Germany, should be of great
erest, we think, to all English town
nners and municipal officials, even though
ey have no intention of competing.
Characterised by the scientific method and
that painstaking thoroughness for which
e Germans are so distinguished, these con-
itions amount to a most interesting and
uable essay on the whole art and science
town planning, as at present understood in
Germany, emphasising the principal points to

planner the man with the creative type of
mind can attain a grasp of the essential
points of the problem, and be in a position to
tackle it with any hope of success. We doubt
whether the officials of any English town are
yet in a position to supply such exhaustive
information and draw up such conditions.

We note with approval that, in addition to
the five prizes offered, a sum of 1,000*l.* is set
aside for the purchase of any other schemes,
or parts of schemes, which show sufficient
merit. We commend this arrangement to
the Government of the Commonwealth of
Australia, which proposes to adopt any valu-
able or striking idea from any of the non-
premiated designs without payment to the
author.

CONDITIONS OF THE COMPETITION.

The object of the competition is to secure
a plan for building up the town of Düsseldorf.

The plan must satisfy the requirements of
traffic, public health, administration, and
beauty.

The scheme of buildings now existing in
the district of Düsseldorf to be retained as
far as possible in the suggested plan. Re-
vision is, however, not forbidden, and the
competitors must decide to what extent re-
building is necessitated by their schemes.

The designs must contain suggestions for
the extension and supplementing of existing
streets and communication systems (tram-
ways, town, and general railways).

Further, there must be designated in the
plan sites for the provision of dwellings and
centres of industry, having regard to the con-
ditions governing each (road and water com-
munications, points of the compass, prevail-
ing winds, parks, and forest lands).

The scheme of roads, tramways, and town
railways, as well as general railways, should
extend to Kaiserwerth and Ratingen in the
north, Hilden in the east, Benrath in the
south, and Nenz in the west (smaller com-
mercial district).

The proposed traffic arrangements should
be so laid out as to allow of a possible linking
up by streets and railways with the surround-
ing large towns, Duisburg, Essen, Elberfeld,
M-Gladbach, Rheidt, Crefeld (greater com-
mercial district). The proposals for such a
linking up to be given.

Suggestions are to be shown for the cultiva-
tion of open spaces in the town of Düsseldorf,
and in the lesser and greater district exten-
sion, in the greater, however, only so far as
a connexion of the forest and meadow lands
already existing in it with the commons of
the other two districts allow.

The 100000 plan to be used for setting out
of the town; the 250000 for the lesser exten-
sion; and the 1000000 for the greater extension.
The two last need only contain the main
thoroughfares of the town of Düsseldorf.

The following points are to be observed
in the designs:—

(1) The principal commercial streets from
the town into the country are to be considered
the groundwork of the plan. A future sup-
plementing of this main network with new
streets is to be assumed.

The main streets must be wide enough for

tramways and their construction over and
under the future fast trains (high level and
underground railways). The necessity of
further bridges over the Rhein in the future
is to be borne in mind.

(2) Boulevards and promenades, that must
be as free from through traffic as possible,
must be provided for between the open spaces
(see 7). Hereto belong also the streets on
the Rhein to north and south of the town, in
the setting out of which the fixed waterline
is to be taken into account. This is to be
noted in (4) in connexion with the centres of
industry.

(3) Necessary cutting through and widen-
ing of streets for improved connexion of the
streets named in (1) with the inner town are
to be shown in the 100000 plan of the district,
which is to be obtained gratis from the
Survey Office.

(4) Proposals must be made for the division
of the town into residential and industrial
centres, whereby a revised distribution of the
town divisions in the several classes and zones
of buildings becomes possible. In arranging

Outside the Luxembourg, Paris.
("Sculpture in Civic Art.")

In the Tuileries Gardens, Paris.
("Sculpture in Civic Art.")

the industrial centres, good railway communi-
cation and direct or indirect (by means of
railway waggons) communication with the
Rhein should be considered. New harbour
basins must be foreshadowed.

The separation of the industrial from the
residential quarters by park and woodland
should be aimed at.

Residential quarters, with dwellings suit-
able for the various classes of the inhabitants
(detached houses, terrace houses, small and
large blocks of dwellings), as well as plans
for open and enclosed places, to be provided
for, in addition to existing buildings, to such

Sculpture at Versailles.

"Painting": Figure outside the Louvre.
("Sculpture in Civic Art.")

an extent as to meet the requirements of the increasing population until the year 1930. (See graphic representation of the increase in occupation of land for buildings predicted to 1950, compiled from the Düsseldorf Statistical Office.)

By regulating the widths of streets and depth of building blocks, wholesome conditions of living are produced. At the same time the ground should be apportioned carefully, and nothing allowed to go by chance. Low buildings are to be recommended; moreover, the detached house will not greatly concern the lower classes. Suggestions may also be indicated for new suburbs in the larger district of the built-up town, easily accessible by tram.

(5) The position of the principal railways is detrimental to the further development of the town at different points. It should be considered in what way this disadvantage can best be overcome, especially how far the numerous crossings over can be done away with.

Increase of the present insufficient accommodation for traffic at the principal railway-station is to be aimed at, so that an increased amount can be dealt with.

The railway system round Düsseldorf is to be supplemented with a main line bridging the Rhein to the north of the town.

The suggested alterations and extensions of the railways need only be roughly sketched out on plan, but must be accompanied by explanatory notes.

(6) Suggestions are to be made for the introduction of a contemplated line of railway from Cologne, and from the industrial district, for the connecting up of these two lines with each other, and with the line to Crefeld (Rhein, Bahn).

(7) Sites as large and convenient as possible, supplementing those existing, to be allotted for wood, park, and meadow land, as well as for exhibition purposes, aviation, games, and sports.

The rivulet valley, not yet built on, must be especially taken into consideration. First to be considered for the new schemes are those lands in possession of the town, then those belonging to the Fiskus, and, lastly, larger pieces possessed by private individuals.

(8) The town entertains the project of erecting a new Town Hall in the quarter between Stiftsplatz and Schulstrasse Platz. The required area is 18,000 sq. metres (enclosed courts) in extent, and provision must be made for a possible extension in the future. The market place is, if possible, to remain on its present site. The rearrangement necessary for erection of the Town Hall in the before-mentioned quarter of the town, and, perhaps, also the adjacent neighbourhood, is to be represented on the 1:500 scale plan.

(9) The requisite sites (Plätze) must be provided for, an arts and crafts school building of about 2,200 sq. metres site area, a museum of about 5,000 sq. metres extent, a large concert-house of about 5,000 sq. metres extent with proportionately large garden, and a town theatre to seat 2,000. For these use the section plans mentioned in (3). Further, schemes must be thought out for supplying the town from one or more points with food (market halls) coming into Düsseldorf by rail, ship, or other conveyances from the southern town centres and from parts to the west and south-west of the town. Further, a place for a new slaughter-house, about the size of existing one, is to be provided.

Among other public buildings of the first importance there will be primary, secondary, and elementary schools, and in this connexion it must be borne in mind that for every 5,000 inhabitants there must be an elementary school of fourteen classes (seven for boys and seven for girls). Then baths, conveniently grouped with public libraries, reading-rooms, savings bank branches, etc. An effort should be made to conveniently place the various sports grounds in relation to the different localities, as mentioned in (4).

Sites for all public buildings must be chosen so far as is possible from land in the possession of the town.

(10) The suggestions made, especially those in relation to traffic, the disposition of extended industrial and residential quarters, the division of the latter into the several classes of buildings, and also the placing and grouping of public buildings, and any point

which seems of importance to the author should be discussed in a short explanatory report.

The following items will be supplied to intending candidates:—

(1) Plan of town to 1:500 scale, with land in possession of town coloured (yellow), that owned by Fiskus. (violet), and larger plots owned by private individuals (coloured round with red). (Extra plans may be procured from the Town Survey Office at 10s.)

(2) A similar plan, uncoloured, to draw the design upon. (Extra plans obtainable at 5s.)

(3) A similar plan, black and white, 1:500 for purposes of study, with notes of existing schools.

(4) Plan 1:500 of the district between Stiftsplatz and Schulstrasse.

(5) Plan 1:500 (surveyors' tables) to take design.

(6) Plan 1:500 (general plan) to take design.

(7) Special plan of the Aper and Grafenberger Forests, 1:500 with contours.

(8) Town plan 1:500 with particulars of density of population in the various parts of old Düsseldorf.

(9) Town plan 1:500 with particulars of different building values.

(10) Graphic representation of predicted needs of building land to meet increase in different sections of population till the year 1950.

(11) Results of traffic census at fourteen points in the town.

(12) Daily amount of traffic on the lines of town tramways in 1910.

(13) Journey times and fares from the centre of Düsseldorf to the various centres of traffic.

(14) Receipts and expenditure of tramways in comparison with the mileage (in kilometres) and passenger traffic.

(15) Recent street building methods. Tramways with their construction.

(16) Compilation of means of providing town with food.

(17) Growth of the town of D., 1795-1910.

(18) Industrial development in D. according to trades.

(19) Traffic in D. harbour, 1795-1910.

(20) Rail goods traffic in D., 1896-1910.

(21) The inhabited estates to the number of dwellings in sixteen large towns.

(22) Density of houses in twenty large towns.

(23) Density of houses in statistical area of D. 1905, thus without the incorporated centres.

(24) Average cost of rent in statistical area.

(25) Occupied buildings with gardens (as before).

(26) The division of buildings according to size in statistical area (as before).

(27) The sale for residential property in D., 1902-1910.

(28) Direction of wind, compiled from observations in 1909 and 1910.

Required Drawings.

(a) Building plan for the district of Düsseldorf (Compare 1.7 and 9.)

(b) A groundwork plan for the smaller extension 1:500 (Survey tables, see Introduction.)

(c) Representation of proposed connexions by road and rail with the large neighbouring towns 1:500 (General plan, see Introduction.)

(d) Detail plan for part of town between Stiftsplatz and Schulstrasse 1:500 (See 8.)

The addition of perspective sketches appropriate to the work are permissible.

The size of a single sheet must not exceed half a square metre.

Coloured drawings will not be considered in the selection, nor exhibited.

The prizes offered are:—1st, 20,000 M. (1,000*l.*); 2nd, 15,000 M. (750*l.*); 3rd, 10,000 M. (500*l.*); 4th and 5th, 7,500 M. (375*l.*). By consent of the judges it is open to them to equalise 1st and 2nd prizes, bringing each to 15,000 M. (750*l.*)

The prizes will be awarded so far as suitable schemes are sent in.

In judging, value will be given to the practicable execution of the scheme, having regard to the cost involved.

Besides the above five prizes there will be 20,000 M. (1,000*l.*) set aside to be employed

in sums not less than 1,000 M. (50*l.*) nor over 5,000 M. (250*l.*) for the purchase of designs at the discretion of the judges, not to be divided amongst the whole of the competitors, but only those designs which show some practical and artistic merits.

Moreover, a part of a scheme only may be bought when the scheme is not successful as a whole.

The designs, together with explanatory report, must reach the Rathaus, Düsseldorf, by July 1, 1912, 6 p.m., addressed "An dem Herrn Oberbürgermeister, Düsseldorf," and marked "Wettbewerb für den Bebauungsplan."

Works received after that date or posted later will not be allowed to compete for a prize.

The designs are to be sent flat in portfolios, and provided with an identifying word or sign.

A sealed envelope must accompany the plans, bearing the same word or sign, and the name and address of designer inside.

The twenty-eight plans mentioned may be obtained on depositing 100 M. (5*l.*) with the survey office of the town. The order will be returned on receipt of an entry, or of the said plans sent back undamaged within four weeks.

PROPOSED MEMORIAL TO KING EDWARD.

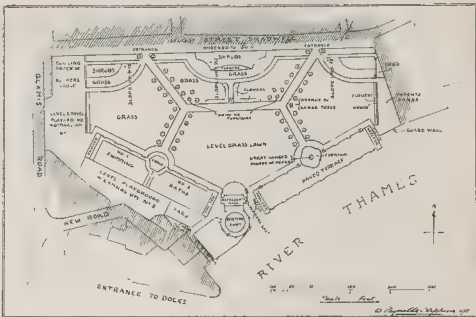

DR. PAGET, Bishop of Stepney, proposed some time ago that the old Shadwell Fish Market, disused, should be adapted to form a riverside park. The suggestion, supported by an influential committee, has met with approval, and we are now able to give publicity to a scheme by Mr. W. Reynolds-Stephens which has been considered by various people interested in the arrangements.

The memorial, to perpetuate the memory of King Edward as a "peacemaker," would be on the terrace. It would take the form of a great seated figure of Peace, in full view of the passing ships of the nations. She holds out to them the olive branch; her lap of plenty overflows with swags of fruit, and roses fall between the feathers of her wings. In front she holds a large plaque with a portrait of King Edward. The fountain which surrounds the figure is emblematical of maritime nation. In the centre of this fountain under the base of the figure would be sculpture to typify London, introducing the principal buildings, such as the Houses of Parliament, (the Government), St. Paul's Cathedral (the Church), the Tower or the Horse Guards (the Army), Greenwich Hospital (the Navy).

The park itself would be treated as shown in the accompanying plan. The details would be as follows:—(1) Paved terrace, 350 ft. by 60 ft., with shelter at each end; shrubs in tubs and seats in the recesses of the parapet walls. (2) Double swimming-bath (open air); water in each 155 ft. by 55 ft.; partition and staging between would be removable for special swimming contests. Dressing cubicles in recesses of north wall. Central entrance lodge for custodian. Bath easily drained and cleaned into river at low tide. (3) Refreshment hall (with clock in roof); main hall open to roof 47 ft. by 25 ft., fireplace east end. In front, semicircular brick tea terrace edged with ivy on posts and chains. Two annexes, each 18 ft. by 9 ft.; that at east end, women's lavatory, at west end kitchen. (4) Men's water-closet off the yard, and men's lavatory at south corner of bath shelter. (5) Playgrounds—(a) level grass lawn in centre, about 300 ft. by

The Shadwell Fish Market Site.

Proposed King Edward Memorial.

Scheme by Mr. Reynolds-Stephens.

70 ft.; (b) two level ones of asphalt or gravel for wet weather, with gymnasium, tennis court, etc.; (c) sands corner for infants, with a guard wall on the river front, pierced at places so that the high tide floods the sand about 1 ft. Seats about the park under the trees, but especially sheltered ones to the north of terrace and baths in wall recesses which are 7 ft. high. (7) Plot for keeper's house, or this could be made into a bowling green. Two keeper's yards. (8) A stand and place for river row boats can easily be added. Mr. Reynolds-Stephens thus provides for persons of all ages, and his scheme is worthy of consideration.

CIVIC DESIGN NOTES.

In view of the fact that the attempts hitherto made towards the improvement of Ottawa have signally failed to enhance the architectural dignity of that city, and, feeling that the present Improvement Commission has not displayed a marked appreciation of this aspect of the question, the Ontario Association of Architects has passed a resolution in the following terms:—
“Resolved that the Ontario Association of Architects in congress assembled desires to express its appreciation of the fact that measures being taken to materially add to the dignity and beauty of Ottawa as the capital city, and

further that the Association respectfully suggests that the time has arrived for a broader outlook on the situation with a view to providing for the necessities of the future both governmental and civic. Further, in view of the criticisms of certain eminent landscape architects and town-planners who have studied the question recently, it is very necessary that some system should be adopted for the co-ordination, of the several works in progress and for planning of future works as part of harmonious whole.
“The Association, after a careful inspection of the work that has already been executed, feels that much which has been done will have to be undone, as it neither meets the demands of the situation in design or execution. The Association would respectfully point out that in many cases the fundamental principles of the disposition of masses and of consideration for natural features, have given place to a striving after effect by over-elaboration of detail and the use of a quantity of meretricious ornament quite devoid of artistic quality.
“Having regard to these facts, the Association would respectfully urge upon the Government the appointment of an advisory commission of architects (nominated by the Council of the Royal Architectural Institute), which would study the question from all points of view and particularly in regard to future needs. The Association would point out the success which attended the appointment of such a Commission at Washington, D.C. If the dignity of Ottawa as a capital city is to be preserved to posterity it is incumbent that a wise disposition

of streets, departmental and civic buildings be made now. The greatest heritage that can be handed down to future Ottawa is a well-planned city.”
THE fact that the *Standard* Charing Cross has devoted a column to the consideration of a scheme for a new bridge at Charing Cross, prepared by Mr. W. L. Lucas, is gratifying evidence that the public interest aroused in this question by Mr. John Burns and others is well maintained. There is no doubt this is a much-needed improvement, and one which would have a great effect on the appearance of the river, but for all that we can hardly expect it to be realised immediately. Public opinion still needs educating, and to this end discussion in the Press of any and every suggested scheme is of value. The question of convenience may still weigh with some, but, as Mr. Lucas points out, in these days of rapid motor traffic the station would be as convenient on one side of the river as on the other.
BARTHOLOMEW CLOSE and New Cloth Fair is generally accounted to be the most picturesque portion of the City still remaining; certainly it is the most interesting and picturesquely, but the ancient structures of this old-world spot are now threatened with destruction by the carrying out of a new thoroughfare running from Long-lane to Aldersgate-street. The Close, with its quaint narrow streets and

Sketch by Mr. Adrian Berrington from the Model of the Proposed King Edward Memorial Scheme suggested by Mr. Reynolds-Stephens.

little squares, is hemmed in by Cloth Fair, Smithfield Market, and Aldersgate-street, and once upon a time was connected with the famous Church and Priory of St. Bartholomew, the eastern portion of which still remains. The old gateway to the square is fortunately still intact, and in former times was the western entrance to the original church. From this entrance the new road will run through Cloth Fair, to the north, and, turning to the right, so on to Aldersgate-street. The Close has boasted many famous residents, including Rahere, the founder of the Priory, and William Bolton, a later Prior, who built Canonbury Tower at Islington, which is said to have been connected with the Priory of St. Bartholomew by a subterranean passage. Dr. Caius, who founded Caius College, Cambridge, and John Milton, the poet, have resided there, the latter in retirement at the Restoration. Hubert Le Sueur, the modeller of the statue of Charles I. at Charing Cross, and Benjamin Franklin, who worked in a local printing office, have also been among its residents. For some little time surveying has been going on in the neighbourhood, and shortly the new thoroughfare will cut through this ancient quarter, involving the destruction of the famous "Dick Whittington" tavern at the corner of Cloth Fair. This house boasts the distinction of possessing the oldest licence in the City, being 560 years old. Opposite is an older tavern still, the "Hand and Shears," which, however, has been modernised. It was at the latter establishment that the ancient Court of Pie-powders was held during the Fair of St. Bartholomew to settle disputes in regard to debts and contracts.

Although the new road will result in doing away with a most ancient and picturesque portion of the City, it is a matter for congratulation to know that the "Hand and Shears" will, in all probability, be spared.

Relief Road at Croydon.

THE Road Board have offered a grant of 30,000*l.* and the Ecclesiastical Commissioners one of 5,000*l.* in aid of the construction of the contemplated by-pass and relief road from Thornton Heath, through Vaddon, to the South of Croydon, and so to the main Brighton-road at Purley—a length of four miles. The scheme does not find favour with the Croydon Chamber of Commerce, who apprehend that a diversion of traffic will depreciate the trade of the town, and consider that money should be applied to a completion of the widening of the High-street through the town and the bridge across the railway at West Croydon. We cannot endorse this view, being convinced that the method of relief roads is the more economical one for improving traffic conditions, and, even were the result such as the Chamber of Commerce anticipate, which we very much doubt, this is but a narrow-minded and parochial way of looking at a great question. We do not believe that the traffic provided for by the proposed route would be of a value counterbalancing the increased congestion it would entail and the costly alternative of destroying property in the centre of a busy town. Improvements are undoubtedly needed in Croydon, but they are not of a character giving a claim on the funds of the Road Board.

Growth of a Brazilian City.

REMARKABLE as has been the progress of the State of São Paulo during the past twenty years, that of the capital of the State has (writes the British Consul, Mr. O'Sullivan-Beaure) been more remarkable still. In 1887 São Paulo was a quiet, rather sleepy town of the usual up-country Brazilian type, with a population of some 47,000 inhabitants, notable only from the fact that a large number of religious orders had established themselves therein. By 1890 the population had risen to 64,934, in 1892 it was 130,775, in 1900 it was 239,920, in 1907 it had increased to 300,000, and in 1910 it stood at 350,000. At present São Paulo ranks as the record city in Brazil, Rio de Janeiro being, of course, the first. Its appearance is a matter of surprise to visitors; it resembles one of the great cities of Europe. The principal business streets are lined with shops which, in outward appearance and in the variety and richness of their contents, vie with those of Paris or of London. The city has been planned with much taste, the various streets and avenues are wide and straight; all well paved and planted with trees. Throughout the city exist a number of public gardens. Many of the private residences are of great size and magnificence. The bustle and activity and the ever-increasing traffic which prevail

throughout the city during business hours make it difficult for newcomers to realise that they are in a Brazilian town. The municipality spends money liberally with a view to improving and beautifying the city. There is just being completed a municipal theatre, which vies in magnificence with that of Paris, upon which it is modeled. It is estimated that the total cost of this opera-house will exceed 1,500,000*l.* Within the past few months the municipality have voted a sum of 400,000*l.* for the purpose of constructing a new avenue of communication. A project is under discussion for the carrying-out of an immense scheme, estimated to cost some 3,000,000*l.*, for the construction of a series of main boulevards to traverse the city in different directions. Great activity prevails in the building trades. On all sides are to be seen houses in course of construction, which houses are occupied as soon as finished. They are being built at the rate of 3,000 per annum. The city is comparatively healthy, the death-rate averaging 19·9 per 1,000 of population.

THE Local Government Board will hold inquiries into proposed expenditure of local authorities as follows:—Mansfield Borough Council, 4,700*l.* (September 26); Southport Borough Council, 8,200*l.* (September 27); Winchester City Council, 1,750*l.* (September 28); Barrow-in-Furness Borough Council, 2,500*l.* (September 26); Derby Borough Council, 2,200*l.* (September 29); Heaton Norris Urban District Council, 1,150*l.* (September 27);

Richmond Borough Council, 4,378*l.* (September 26); Whiston Rural District Council, 1,350*l.* (September 29); Blackpool Borough Council, 8,079*l.* and 7,200*l.* (September 26); Exmouth Urban District Council, 1,200*l.* (September 28); Leyton Urban District Council, 1,867*l.* for public offices extensions (September 26); Ilford Urban District Council, 10,000*l.* for small dwellings (September 26); Coventry City Council, 11,500*l.* for city hospital (September 27).

Lectures on Town Planning and Garden Cities.

THE Garden Cities and Town Planning Association, 31 Old Broad Street, Holborn, London, W.C., prepared to arrange for lectures, with or without lantern slides, in any part of the country, illustrating the progress of the town planning movement at home and abroad and the great developments in the adoption of garden city principles. Applications for particulars should be made to the Secretary, Mr. Ewart G. Culpin, as above.

A LECTURESHIP in City Design and Town Planning has been established in the University of Birmingham. The cost will be defrayed by the Bournville Village Trust. Mr. Raymond Unwin, F.R.I.B.A., has accepted the Lectureship for the first year, and will begin his course during the present session. The Lectureship will at first be associated with the Department of Civil Engineering, wherein are students training for civil and municipal service of various kinds.

Mr. W. Reynolds-Stephens, Sculptor.

THE BUILDING TRADE.

BUILDERS AND EXTRA-ORDINARY TRAFFIC.

FROM A LEGAL CONTRIBUTOR.

THE builder who is accustomed to sign contracts involving the haulage of large quantities of material must needs take into account the amount of possible liability for extraordinary traffic. In dry weather the traction engine, with its trail of attendant waggons, does little harm to the hard high road; notwithstanding the experience of the winter of 1911—prolonged drought is not normal condition of affairs. Assuming that, owing to the haulage of many tons of bricks or spoil along a road, the surface is deeply scarred with ruts that the neighbourhood is compelled to incur large expense who is to bear the burden?

It is provided by the Highways and Locomotives Amendment Act, 1878, that where a certificate of their surveyor, it appears to the authority which is liable or has undertaken to repair any highway, whether a main or not, that, having regard to the average use of repairing highways in the neighbourhood, extraordinary expenses have been incurred by such authority in repairing such highway by reason of the damage caused by excessive weight passing along the same, or extraordinary traffic thereon, such authority may recover in a summary manner from any person, or, in consequence of, the order such weight or traffic has been ordered to repair, the amount of such expenses may be recovered to the satisfaction of the Court having cognisance of the case to have been incurred by such authority by reason of the damage arising from such weight or traffic as said.

It is provided that any person against whom such expenses are entered into an agreement with such authority as is mentioned in this section be liable to pay to them of a composition in respect of such weight or traffic, and therefore the persons so paying the same shall be subject to any proceedings under this section.

The words printed in italics were added to the above section in 1898 in order to enable highway authority to proceed direct against the person, company, or firm employing the haulage.

The Highways Act of 1898, which made the amendment above set out, has not had much effect to protect the builder and make his employers responsible. It is true that the important case, *e.g.*, that of *Epsom Urban District Council v. London County Council* (1891, 16 T. L. R. 571), was decided in favour of the person in the position of a builder. The defendants employed two contractors for the erection of a temporary hospital for the alteration of certain existing buildings. The works involved the carriage of exceptionally heavy traffic along some of the roads in the plaintiffs' district. It was held that the traffic had been conducted in consequence of the defendants' orders, and they were liable to pay the cost of repairing the road.

In a later case, *Egham Rural District Council v. Gordon* (18 T. L. R. 515), a different construction was put upon the section. The defendant, who was building a house, bought 250,000 bricks without giving any instructions how they were to be transported. The defendant then went away, and he was absent the bricks were sent by steam haulage, and the road was consequently damaged. In an action to recover the expense of repairing the road, the County Court judge found that the weight of traffic was excessive, but that it did not place "in consequence of" the defendant's order within the meaning of section 12 of the Locomotive Act, 1898. It was decided by the County Court judge was justified in coming to the conclusion that the damage was done by the vendor choosing this particular

mode of sending the bricks, and not in consequence of any order given by the defendant, and that the defendant was not liable.

Points of some nicety are likely to arise in the settlement of these disputes. For instance, suppose a company employed a builder A. to build a factory, and A. employed B., a sub-contractor, to cart the material. In the event of there being extraordinary traffic, who would be liable? In the case of *Laphorn v. Harvey* (49 J. P. 709), which was decided under the old Act, these were the facts, and the builder A. was held liable. It is conceived that, under the amended Act, the company itself might be held responsible.

It is not easy to reconcile these cases or to lay down a logical principle which will always apply. Indeed, it would seem as if the question was one of fact for the decision of the judge who tries each particular case.

A correspondent recently put the following facts before the Editor of the *Builder*: Damage was done to roads by a traction engine hauling bricks, timber, etc., to a new building. (1) The engine and trucks belong to A., who contracts with B. to haul bricks at a given price to new buildings. (2) B., for convenience of business, quotes exactly the same price to C., who pays B. for the haulage, and B. pays A. to avoid multiplicity of accounts. (3) C. is one of a number of contractors who tender to build for D., and by reason of the traction haulage D. gets his house erected at a lower price than otherwise could be done. (4) D. is therefore the only party actually benefited by the cheaper haulage. As we read the Act, the one who benefits is the party who should pay. Can you please tell us if we are correct?

Applying the decisions, so far as they are relevant, to this statement of fact, there seems to be no case in which the party who benefits is made liable merely because the advantage accrues to him. Had this been the ruling principle, it is obvious that the *Egham case* (*supra*) must have been decided the other way, as the purchaser of the 250,000 bricks got the benefit, because if the vendor had not been allowed to choose his own method of sending bricks he would probably have charged a higher price. Nor does it appear that road haulage was actually contemplated in the contract with D. In the circumstances it is conceived that in the case suggested the contractor would himself be held responsible.

One word as to the amount of expense recoverable. It has been decided that "the expenses recoverable are not the expenses incurred by the actual damage caused, but a proportionate part, representing the excess over the average expenses of repair, as it would be unjust to charge the party occasioning the damage with the whole expense of reinstating the road. Where, however, the highway in question has recently been repaired, so that but for extraordinary traffic no repairs would have been required for twelve months or eighteen months, it is just that the whole cost of the repairs necessitated by the traffic should be recoverable." It has, however, been held that where the road has been so damaged as to require to be entirely reconstructed, and the extraordinary expenses of the repair required to be done to rectify the damage and the expense of reconstruction cannot be severed, the wrongdoer may be held liable in the total expense of the repair and reconstruction.

The question what is "extraordinary traffic" within the meaning of the Act under discussion is one which has been much canvassed. As we have seen, the section provides that the cost of such traffic is to be considered in relation to the average expense of repairing highways in the neighbourhood. It is exceedingly difficult to lay down any general principle which would cover the facts of any particular case. One or two instances may serve to throw light on the question.

In *Williams v. Davis* (44 J. P. 347) the appellants were timber merchants, who had purchased timber in the ordinary course of business. The timber was loaded and carried, between Christmas and March, on timber carriages in the customary way of carrying

timber. There were sixty-seven loads in all, the weight varying from two or three to nearly five tons. The heavy loads were heavier than the loads of agricultural produce passing along the road in question. "The sixty-seven loads of timber were a greater number of timber loads than usually passed over the said roads in three consecutive months." The justices found that "the said sixty-seven loads of timber" were, in the aggregate, "excessive weight and extraordinary traffic," and the Divisional Court upheld their decision. The late Mr. Justice Lush said, "What the traffic was to be compared with was the ordinary traffic of the road." Note the fact that it was timber—the natural product of the land—which was carried had no bearing on the decision.

The authorities appear to warrant the inference that what is extraordinary traffic in one district will not necessarily be regarded as such in another, and if the use of heavy vehicles is connected with an industry which is characteristic of a particular neighbourhood, the Court will be justified in finding as a fact that the traffic is not excessive. In the case of *Wallington v. Hoskins* (1880, 6 Q. B. D. 206 n.), the owner of certain stone quarries used to send the stones by waggon along the highway, three or four horses to each waggon. The roads, when used for agricultural traffic, cost in repairs about 20s. per mile, and when used for stone traffic about 130s. per mile. Each waggon and load weighed about 5 or 6 tons. The stone traffic was a recognised business in the neighbourhood, and the waggon loads were the usual weight in such traffic. The justices held that the traffic was not extraordinary, but that the weights were excessive, and that extraordinary expense had been incurred by reason of the damage caused by such excessive weight, and made an order on the plaintiff to pay those expenses. The Queen's Bench Division held that the justices were right in finding on the facts "that the traffic was not extraordinary, but ordinary traffic, regard being had to the industry of the place, and regard being had to the recognised mode in which that industry is carried on." The traffic not being extraordinary, the Court further held that the weights could not be excessive, if they were found in fact to be the weights usual in the stone trade. "It seems to me," said Lord Coleridge, C.J., "that the moment the justices hold that this is an ordinary and recognised industry of the place, and that it is carried on in the ordinary and recognised mode in which such industry is carried on, the weights are no longer excessive."

Similarly, in *Lower Strathford Highway Board v. Hatfield Chase Company* (1893, 57 J. P. 567), the defendant company manufactured peat moss from a moor of 3,000 acres, and used for the purpose of their business, the highway between their factory and the railway-station. The five drays which they kept were lighter than those used in other traffic, which was agricultural traffic, and passed each day over the highway. The justices found that this "was a recognised industry" in the neighbourhood, and that excessive weights were not carried, and on these grounds determined that the traffic complained of was not extraordinary within the meaning of this section. The Divisional Court refused to disturb the finding. In another case, *R. v. Williamson* (1881, 45 J. P. 505), the Court pointed out that where a particular industry is carried on by a number of persons in the same neighbourhood, it is erroneous to say that, the traffic caused by one person is extraordinary, because he might have followed the example of other persons and made use of the railway. It will have been noticed that, while some of the cases quoted in this article were decided by justices, others came before the County Court. This may be explained by the fact that the Act of 1898 transferred the jurisdiction of the justices to the County Court in cases where the expenses claimed were under 250s., and to the High Court where the claim was over that amount.

In Emden's "Building Contracts" (fourth edition), the law is thus summarised:—"Extraordinary traffic," as distinct from "excessive weight," includes all such continuous or repeated user of the road by a person's vehicles as is out of the common order of traffic, and as may be calculated to damage the highway and increase the expenditure on its repair.

"The section does not mean that a man is to be mulcted merely because he uses the road more than others do, even if it be his own user which has produced the mischief to the road. The traffic must be extraordinary as regards the ordinary user of the road as a whole by all who use it, and not merely large as regards the traffic put on the road by other persons."

One of the most recent cases on the subject (Billericay Rural District Council v. Poplar Union, J. P., February 4, 1911) shows that in estimating the liability of a person leading traffic, the court must take a broad view of the question. In the case mentioned, the defendant guardians employed a contractor to carry manure in trucks drawn by a traction engine on certain country roads in the plaintiffs' district. The manure was brought from London to be used on a farm colony belonging to the defendant guardians. There was evidence that the traffic so led did some slight damage to the roads, which extended into three parishes in the plaintiffs' district, but it was shown that, notwithstanding the damage, the cost of repairing these roads during the year, which included the period in question, very slightly exceeded the average cost of repairs during the previous five years.

In an action to recover extraordinary expenses pursuant to sect. 23 of the Highways Act, 1878, the defendants pleaded that there was no extraordinary traffic, and that no extraordinary expense had been incurred.

Mr. Justice Channell held that, although slight damage had been done to the roads, there was no evidence that extraordinary expenses—as those words ought to be understood—had been incurred. The right to recover extraordinary expenses is founded on this that a man must not increase the burden of the highway rate upon his neighbours. He also said that the words "average expense of repairing highways in the neighbourhood" point to the average cost of similar roads. Thus, if the road in question is a country road not very far from town, the expense of repairing roads in the town is not to be considered. Judgment was therefore entered for the defendants.

LONDON MASTER BUILDERS' ASSOCIATION.

A COUNCIL meeting of the London Master Builders' Association was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, September 21, with the President (Mr. G. Bird Godson) in the chair. The minutes of the last ordinary Council meeting, together with those of the special Council meeting held on the 23rd ult., of the special Committee meeting, the report of the Conciliation Board meeting, and the report of the Finance Committee were read and confirmed. Several matters from the National Federation were considered, and the question of national insurance and unemployment was discussed. Attention was drawn to instances of intimidation during the late strike and to the obvious evils attending peaceful picketing.

The following new members were elected and nominated:—Elected.—Ordinary member, Messrs. W. Moss & Sons, Ltd.; Associate members, Messrs. Smeed, Dean, & Co., Ltd.; Messrs. Lawford & Sons, Ltd. Nominated.—Associate members, The Metropolitan Asphalt Company; Messrs. Loosley & Sons; Messrs. F. A. Clark & Son.

BUILDING IN NOTTINGHAM.

According to a local report there is some indication that the building trade in Nottingham will improve. The eight weeks' strike of the builders' labourers in the early summer proved a serious and costly matter to many contractors, and its effect is still evident; but the trade generally in the city is steadier than a year ago. Speculative building is not extensive, but the rebuilding of Carrington-street and Grey Friar-gate will help to a great extent to keep the trade normal through the winter and spring.

GENERAL BUILDING NEWS.

GRAMMAR SCHOOL, PRESTON.

The foundation-stone of a new Grammar School has been laid in Moor Park-avenue, Preston, the estimated cost of the building being 12,000*l.*, exclusive of equipment. Messrs. Woolfall & Eccles, of Liverpool, are the architects, and Messrs. T. Croft & Sons the contractors.

SCHOOLS IN LEICESTER.

Mr. W. K. Bedingfield is the architect of the new adult school in Leicester, recently completed. It is proposed to build a new elementary school in the Hindley-road, but the infants' department only will be proceeded with at first.

NEW SCHOOL, CHESTER-LE-STREET.

A new secondary school has been opened at Chester-le-Street, accommodation being provided for over 200 pupils. The buildings were designed by Messrs. Clark & Moscrop, F.F.R.I.B.A., of Darlington. Mr. J. L. Atkinson was clerk of the works, and Mr. Joseph Huntley, of Sunderland, the chief contractor. The heating apparatus was put in by Messrs. J. J. Spoor & Son, of Bishop Auckland, and the furniture and fittings have been supplied by Messrs. Illingworth, Ingham, & Co., of Leeds. The cost, exclusive of furniture, has been about 10,600*l.*

SCHOOL AT CHESTERFIELD.

The High School for Girls, which has been in progress for some time at Chesterfield, was opened recently by the Duchess of Devonshire. The building, costing 20,000*l.*, has accommodation for 325 scholars, possible extensions being arranged for. Mr. G. H. Widdows, A.R.I.B.A., was the architect.

UDDINGSTON, LANARKSHIRE.

The Bothwell School Board have decided to spend 2,250*l.* on building a manual workshop, washhouse, and laundry at Uddingston.

ABERDEEN IMPROVEMENTS.

In connexion with improvements on the beach at Aberdeen, it is proposed to erect a refreshment kiosk, for which Mr. W. Dyack, the Borough Surveyor, has prepared plans. Two schemes are under consideration, one costing 2,000*l.* and the other 1,645*l.*

TWERTON-ON-AVON, BATH.

The buildings for the Higher Elementary School at Twerton have now been finished. Mr. A. J. Pictor, of Bruton, was the architect, and Messrs. Chancellor & Son, of Bath, were the builders. The cost of the building, including the furniture, was about 6,500*l.*, and accommodation is provided for 250 pupils. Combe Down stone was used.

EMPIRE MUSIC HALL, BURNLEY.

This theatre has been entirely reconstructed in modern Renaissance style from the designs of Mr. B. Crewe, architect. The total seating capacity of the house is about 2,000, with standing room for 700 more. There is a promenade at the back of the hall, in the centre of which is a fire-resisting cinematograph chamber.

ROSYTH NAVAL BASE.

Messrs. Thorburn & Sons, Edinburgh, are the sub-contractors in the building of the new base. Messrs. Easton Gibb & Son, the contractors, and the Admiralty, have sanctioned the use of freestone, which has been found by the Tilbury Contracting Dredging Company in the Ferry Hills, near Rosyth. The existence of this vein, apparently, has been unknown to geologists.

HOME FOR INCURABLES, NEWCASTLE-ON-TYNE.

The new children's wing, which has just been added to the above, was formally opened last Friday. It has been erected to the west of the existing building. On the ground floor it contains a large ward 51 ft. by 24 ft., giving accommodation for twelve beds. Annexes are cut off from the ward by cross-ventilated lobbies. The corridor leading from this ward to the verandah at the south end of the building gives access on one side to nurses' duty-room, which will have full control through inspection windows of the large ward, and a small ward for two beds adjoining. At the end of corridor is a day-room with a large bay window and a door leading out on to the verandah. On the other side of the corridor is a ward kitchen. The staircases leads to similar rooms on the first floor. The servants' bedrooms, box-rooms, bathrooms, etc., are placed on the second floor. The building is connected to the existing building by a corridor. The main verandah at the south end of the building and flat over the connecting corridor will be used by the patients. The floors are fireproof construction, covered with wood blocks to all the rooms and terrazzo paving to corridors, annexes, and

cloakrooms. The floor to the large ward, the first floor is constructed on the armoured tubular flooring system. The building, heated throughout by hot-water radiators, the "Reck" system and with Shortleaves to large wards and open fires to other rooms. The walls and ceilings are covered with "Marblite" plaster, and angles are rounded. The buildings designed and carried out under the vision of Messrs. Shewbrooks & Hodgson, architects, Newcastle. Mr. W. Pocock is a clerk of works, and Messrs. Elliott & Co., contractors; Messrs. Vaughan & Dym, armoured tubular floor; Messrs. Turpin & Co., wood-block flooring and terrazzo paving; Messrs. W. Scott & Sons, cooking apparatus; Messrs. W. Scott & Sons, heating and ventilation; Messrs. Falconar, Cross, & Co., electric light and telephones; Messrs. Austin & Co., Mr. G. G. Laidler, lead glazing; Messrs. S. Clark & Clark, wrought-iron balustrade; Messrs. Ramsay & Co., hardware; Messrs. Shank & Co., sanitary fittings.

TRADE NEWS.

Under the direction of Mr. W. M. S. architect, Lintilhgow, the "Boyle" system ventilation (natural), embracing Boyle's patent "air-pump" ventilators and air in has been applied to Winchburg School.

The Great Staughton Voluntary School, Hunts, has recently been fitted with an D. O. Boyd's hygienic ventilating gear supplied by Messrs. O'Brien, Thomas, & Co., Ltd., of the Marnes-street, London, and Exeter Works, South Bermondsey.

Messrs. Samuel Wellrock & Co. report they have let upon building lease the site No. 64, Long Acre, upon which will be erected an important building. The firm have appointed sole agents for the letting.

We are informed that Messrs. John L. Sons, Ltd., having acquired the sole agency for Duresco in Yorkshire (except south-portion) and Lincolnshire (except south-portion), have opened a depot at Trade street, Doncaster, where they hold large stocks of Duresco, and at the same time carry their general colour department business. The north-eastern counties are served from warehouse at Newcastle-on-Tyne. In view of the fact that members of the decorating trade have in the past sometimes experienced a difficulty in obtaining their supplies of Duresco promptly, the firm desire to state that they fill immediate orders direct from the warehouse.

The Mirabelle Partition Company, Ltd., Prince's Wharf, Wandsworth, S.W., are fitted to the Chancellor's Room in the House of Commons a partition 13 ft. 6 in. long, 16 ft. 6 in. high, fixed without stiffeners. The same company are also fitting a partition 115 ft. long by 35 ft. high at the Union Company's premises.

THE LAND TAXES.

IMPORTANCE OF SUBSTITUTED SITE VALUES.

The Secretary of the Land Union draws attention to the fact that so many cases of extraordinary low valuation having brought to their notice it is desirable to draw the attention of owners, their solicitors and agents, to sect. 2 (3) of the Finance Act 1909-1910, by which owners of leaseholds well as freeholds, are entitled to make application (within three months after the original site value has been settled under the Act) for a substituted higher site value, a protection against increment value duty, all cases where the figures of a provision valuation disclose a site value less than site value at the date when the owner changed it, if such purchase was within two years of April 30, 1909, or during his time. Many holders of leaseholds are under the impression that as they did not purchase and never were the owners of the site they cannot obtain a higher or a substituted site value. This is not so. Anyone with a taxable interest in the land in question apply for and obtain "substituted site value" within three months of the settlement of "original site value." A substituted (or increased) site value on quite a small property has recently, on the application of the owner, been increased by about fifty per cent. The original site value fixed by the provision valuation. Inasmuch as the increment value to be ascertained by comparing the value of the site, when an occasion arises, with a substituted site value (if applied for and obtained), owners will see the enormous importance of applying for and insisting on these substituted site values, which are based upon the prices they paid for the property in better times. The Land Union, dealing with the matter more exhaustively in a pamphlet now in the Press, which can be shortly obtained on application to any branch of that society.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

During the summer recess of the London City Council the following applications under the London Building Acts were dealt with by the Building Acts Committee:—

Lines of Frontage and Projections.

Intersea.—One-story shop at the rear of John's Library, St. John's-hill, Battersea, abutting upon the north-eastern side of the terrace (Mr. C. J. Carter).—Consent.

Hamersmith.—Erection of a one-story shop at No. 53, Waldo-road, Hamersmith (Mr. A. Baker for Messrs. Charrington & Co.).—Refusal.

Hamstead.—Erection of buildings on the north-western side of Haverstock-hill, Hampstead, south-eastward of Belsize-lane (Messrs. Woodward & Sons).—Consent.

Hamstead.—Iron and glass roof in front of the coachhouse at No. 116, Haverstock-hill, Hampstead (Mr. T. Wilson for Mr. H. F. Fen).—Consent.

Hamstead.—Additional story to the rear of a window in front of No. 26a, Bryanston-road, St. Marylebone (Mr. E. L. Luytens).—Consent.

Pancras, West.—Building upon a site on the southern side of Prince of Wales-road, St. Pancras, abutting also upon the western side of Kentish-town-road (Mr. H. Winstanley for Governors of the North-Western Polytechnic).—Consent.

Albion.—Addition to the South London Iron Mission, on the southern side of Newington-road, Walworth (Mr. H. Macintosh for Iron Congregational Union).—Consent.

Albion.—Erection of eight houses on the north side of Dunvegan-road, Eltham (Mr. Tewar).—Consent.

Lines of Frontage and Construction.

Uxham.—Iron and glass shelter at the entrance to Baron's-court tube railway station, Uxham, Hammersmith (Mr. W. E. Delick for the London Electric Railway Company).—Consent.

Uxham.—Iron and glass shelter at the entrance to the Brompton-road tube railway station, Brompton road, Kensington (Mr. W. P. Mandelick for the London Electric Railway Company).—Consent.

Width of Way.

Uxham.—Addition at the rear of the Railway Hotel, Atlantic-road, Brixton (Messrs. Edle & Myers).—Consent.

Uxham.—One-story building at No. 10, Moorfields, City, at least on the prescribed line from the centre of the roadway of the fields (Mr. Delisa Joseph).—Consent.

Uxham.—Building on the western side of the street, Poplar, at least on the prescribed line from the centre of the roadway of the street (Mr. Rowland Paine for the Chairmen and Governors of the Poplar Hospital).—Consent.

Width of Way and Frontage.

Uxham.—Building on the northern side of Lordship-road, Stoke Newington, south-eastward of the New River (Mr. W. Restler for the Metropolitan Water Board).—Consent.

Uxham.—Billiard-room addition at the rear of No. 117, Goldhawk-road, Hampstead, next to Avenue-road (Messrs. G. Elking & Son for the Avenue Property Company).—Refusal.

Uxham.—Addition to a one-story shop at No. 98, Streatham High-road, near to Abbey-road (Booth's Pure Drug Company).—Consent.

Space at Rear.

Uxham.—Hanover-square.—Addition at the rear of No. 4, West Chapel-street, Mayfair (Smith (Camberwell), Ltd., for Mrs. Mason).—Consent.

Construction of Buildings.

Uxham.—Shop on the forecourt No. 44, Queen's-road, Baywater (Messrs. G. & Gibbs).—Consent.

Uxham.—Proposed warehouse building on the southern side of Vauxhall-bridge-road, Westminster (Mr. H. S. Stowell).—Consent.

Uxham.—Additional stories to blocks L and O, at the premises of the Western Electric Company, Henley-road, North Woolwich (Mr. B. Dawson for the Western Electric Company).—Consent.

Uniting of Buildings.

Uxham.—Formation of two openings in a party wall between Nos. 55, Old Broad-street, and Austin Friars House (Mr. C. Reilly for the London Offices Company, Ltd.).—Consent.

Uxham.—Uniting of Electra House and the chambers, Finsbury-pavement and on-wall, City, by the formation of two openings at the first floor level (Mr. J. W. Rhodes for Electra House, Ltd.).—Consent.

Uxham.—Double armoured doors in lieu of double iron doors to three openings in division walls at Messrs. Callow's Van Works, Pembroke-street and Bemerton-street, Islington (Messrs. Lovegrove & Papworth).—Consent.

Uxham.—Uniting of Nos. 98 and 100, Newington Butts, Newington (Messrs. Cluttons for the Ecclesiastical Commissioners).—Consent.

Uxham.—Uniting of Nos. 32 and 34, Commercial-street, Whitechapel (Mr. T. Honnor for Messrs. H. W. Bush & Co., Ltd.).—Consent.

Cubical Extent.

City of London.—Additional cubical extent so far as regards alterations in the basement of Nos. 1 to 13, St. Bride's passage, Salisbury-square, City (Mr. G. W. Mascord for the United Newspapers, Ltd.).—Consent.

Strand.—Additional cubical extent at No. 1, Ramilies-street, Oxford-street (Messrs. Brown & Barry for Mr. J. J. Gridlan).—Refusal.

Westminster.—Additional cubical extent in respect of the raising of the roof of the sun-room at the Stag Brewery, Palace-street, Piccadilly (Mr. M. T. Saunders for Watney, Combe, Reid, & Co., Ltd.).—Consent.

Width of Way and Cubical Extent.

Strand.—Erection upon the site of Nos. 13, 19, 20, and 21, Haymarket, and Nos. 1, 3, and 5, Orange-street, of a building to exceed in extent 250,000 cubic feet (Mr. W. Cave for Burberry, Ltd.).—Consent.

Formation of Streets.

Holborn.—Formation or laying-out of a new street for foot traffic only in connection with the erection of buildings upon the site of Fulwood's-tenements, Holborn (Messrs. J. Leaning & Sons).—Consent.

Newington.—Formation or laying-out of a new street for carriage traffic to lead from Alberta-street to Delverton-road, Newington (Messrs. Briant & Sons for Mr. A. F. De Laune).—Consent.

Wandsworth.—Formation or laying-out of a new street for carriage traffic between Putney-hill and Chertfield-avenue, Putney (Mr. J. C. Radford for Lord Westbury).—Refusal.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Proposed enlargement of St. John the Evangelist Church (3,000); the Vicar.

Aberdeen.—Addition to the Deas Iron Works for Messrs. A. Shank & Sons, Ltd.

Ashbourne.—Proposed nurses' home near Cattle Market; Hon. Secretary of the Ashbourne Cottage Hospital.

Atterborough.—Infirmary; Mr. F. Robinson, Clerk, Weyland Board of Guardians, Watton, Norfolk.

Auckland.—Proposed public offices; Mr. S. Adams, Clerk, Board of Guardians, Bishop Auckland.

Bury.—Pumping station (890); Messrs. Parker & Sharp, builders, Penselholme Green, York.

Batley.—Additions to works for Messrs. Mark Lister & Sons, Heckmondwike.

Blaydon.—Workmen's houses, Blackhall Mill; Mr. George Symon, Surveyor, Blaydon Urban District Council.

Bolsover.—Conversion of old Salvation Army barracks into Council chamber and offices; Mr. W. G. H. Browne, Surveyor, Bolsover Urban District Council.

Bradford.—Tenements, Longlands-area (8,250); Mr. R. G. Kirkby, Architect, Bradford Town Council.

Bristol.—Additions to headquarters' homes; Architect, care of Mr. J. J. Simpson, Clerk, Bristol Board of Guardians, Osborne House, Cotham Park, Bristol.

Bristol.—Buildings (1,500); Mr. Samuel Shield, Filton Laundry, Bristol.

Brixham (Devon).—Reconstruction of premises for the Co-operative Society, Ltd., Fore-street (1,845); Mr. R. Hazlewood, builder, Brixham.

Burradon.—Extensions to premises (2,000) for the Crumlington Co-operative Society.

Chelmsford.—Club-house; Secretary, Golf Club, Chelmsford.

Chorley.—Enlargement of St. Gregory's Roman Catholic School (150 extra places); the Managers.

Clacton-on-Sea.—School; Mr. A. S. Rhey, architect, 214, Bishopsgate, E.C.

Coleraine.—Sixty-six houses; Mr. S. J. M'Fadden, architect, Coleraine.

Dalmarnock.—Proposed suite of halls; Mr. A. B. M'Donald, Engineer and Surveyor, Glasgow City Council.

Dartford.—Extensions to iron warehouse, Victoria Wharf, for the Dartford Glass Company, Ltd. Extensions of building at Wellcome Chemical Works for Messrs. Burroughs, Wellcome, & Co.

Devizes (Wilt).—Additions to hospital (2,000); Mr. H. Ash, builder, Devizes.

Dundalk.—Six houses; Surveyor, Dundalk Urban District Council.

Dundee.—Conversion of Spring-grove house into home for old people (400); Mr. James Thomson, City Architect, Dundee City Council.

East Dean.—Hospital in the Forest for the Dean Forest Liberals.

Edinburgh.—Police headquarters, site of Corn Exchange, Grassmarket; Mr. James A. Williamson, City Superintendent of Works, Edinburgh Town Council.

Egham.—Power station for the Staines and Egham Electric Lighting Company; Messrs. W. & G. Grey, architects, Egham; Mr. J. Carmichael, builder, 331, Trinity-road, S.W.

Elswick.—School (100 places); Mr. A. C. Coffin, Secretary, Education Committee, Newcastle Town Council.

Farnham.—Additions to Union; Messrs. Friend & Lloyd, architects, Grosvenor-road, Aldershot.

Forghus.—Proposed reconstruction of public school (950), for the Newport (Fife) School Board.

Glasgow.—Buildings, Park-street, Kinning Park, for Messrs. A. & J. M'Lellan, carriage contractors, 15, Stanley-street, Kinning Park, Glasgow.

LAW REPORTS.

Howlett v. Harrods, Ltd.

THIS case again came before Mr. Justice Lush in the Vacation Court on the 20th inst., and arose out of certain structural alterations on premises of the defendants adjoining the flat of the plaintiff, and which, the latter complained, constituted, owing to the way the work was carried on, a nuisance to him, and in respect of which his Lordship had granted an interim injunction restraining the defendants from continuing the nuisance. (The facts of the case were reported in the *Builder* of September 15.)

Mr. Bramwell Davis, K.C., on behalf of the plaintiff, in support of the motion, said that the real controversy was whether the way defendants carried on the work on September 6 constituted a nuisance to the plaintiff.

Mr. Hunt, on behalf of the defendants, asked that the motion might be allowed to stand over to enable the defendants to answer the evidence which the plaintiff had filed. He suggested that the motion should stand over for one week, and that the interim injunction which his Lordship had granted should be continued in the meanwhile.

The learned Counsel stated that the defendants did not wish to have litigation if it could be avoided.

His Lordship suggested that the parties should endeavour to come to some arrangement before the following Wednesday.

Mr. Hunt proposed that the present motion should be treated as the trial of the action, that the injunction which had already been granted should be continued, it, of course, being limited to the term of the plaintiff's tenancy under his lease, and that the defendants should pay the costs.

Mr. Bramwell Davis said that he would be contented with that.

Mr. Hunt remarked that the defendants were prohibited by the injunction from working between the hours of 10 p.m. and 6 a.m., and he submitted that that should be varied by restraining the defendants from working between the hours of 10.30 p.m. and 6 a.m. However, his Lordship thought that the defendants should be restrained from working between the hours of 10 p.m. and 6 a.m. he would not say anything further.

His Lordship: I do not think it ought to be varied. Now, Mr. Bramwell Davis, is not that a proper offer for you to accept?

Mr. Bramwell Davis said that he would accept that offer.

Mr. Hunt: We never disputed the noise on the night of September 6.

Mr. Bramwell Davis: Our evidence is that there was a most serious nuisance on the night of September 6.

His Lordship then made an order in the terms stated.

Case under the London Building Act, 1894:

District Surveyor's Fees.

AT the North London Police Court on September 20 the case of Alexander Payne v. Gilbert Prior was heard. The defendant was summoned for the payment of fees claimed by the plaintiff, who is District Surveyor for East Hackney (South) and North Bow, in respect of a wooden shed erected in rear of No. 22, Groombridge-road, South Hackney. This shed, when discovered, was irregular, and was subsequently passed under a license granted by the Hackney Borough Council.

The defendant maintained that as the shed was licensed by the Borough Council no fees were due to the District Surveyor.

The plaintiff quoted the case, Westminster City Corporation v. Watson and others, in which it was held in the High Courts that the transfer of the power to license wooden structures to the Borough Councils does not abolish fees due to the District Surveyor, and showed that his inspection of the structure was necessary.

The magistrate agreed, and made an order for payment of fees due, 15s. and 3s. costs.

LONDON COUNCILS.

Acton.—Plans have been passed for Mr. F. Korren, 14, Newburgh-road, for thirteen houses, near Newburgh and Derwentwater roads.

Berkhamstead.—At a recent meeting of the frontagers in Graemesdyke-road a resolution was passed asking the Berkhamstead Council to instruct their Surveyor to get on with the work of making up Graemesdyke-road, at his estimate of 1,350l. The Council at their last meeting agreed to do this. Plans submitted by Mr. J. Ayres for five houses in Gossons-road have been passed.

Bushey.—At the last meeting of the Council the Surveyor was instructed to prepare plans,

specifications, etc., for making up a street known as Springfields.

Camberwell.—Plans have been passed for Mr. H. C. Constantine for the erection of buildings on the site of Nos. 28, 30, and 32, Denmark-hill, also for Mr. G. H. Fellowes Prynn, for additions to St. Bartholomew's Church, Barkworth-road.

Croydon.—The County Council have passed the following plans:—Mr. P. Crowley, Burlington-road, twelve houses, Ashburton-avenue; Mr. A. Carter Pegg, London-road, house and school, Stanford-road; Mr. H. E. Davey, 34, Penge-road, three houses, Beauchamp-road; Mr. J. J. Taylor, Westminster, S.W., electric theatre, Windmill-road; Mr. F. Windsor, 1, High-street, addition to Hospital, London-road; Mr. D. Weightman, 73, North-end, three houses, Estcourt-road; Messrs. J. & C. Bowyer, 32, Westow-street, motor house, 10, Hatwood-road; Mr. W. Capon, Streatham, S.W., six houses, Melrose-avenue; Mr. D. Waller, Old Palace-road, warehouse, North-end; Mr. H. R. Hunter, Sydenham, twenty-four houses, Baring-road; Mr. W. L. Coomber, 65, London-road, eight houses, Tugela-road. The Rural District Council have decided to fill in and pipe the ditch at Church-road, Mitcham, to the extent of 800 ft., at a cost of 110l.

East Ham.—The Engineer has been directed to submit plans and estimates for the erection of a ladies' convenience in the Central Park. The Works Committee have decided to request the Millers' Karri & Jarrah Company (1902), Ltd., to complete the work of laying sectional wood-block paving in High-street North. A letter has been received from the Local Government Board relative to the disapproval by the Council of plans submitted by Mr. E. D. Hoyland for the erection of a mission church in Rutland-road, asking to have the views of the Corporation thereon, and on the question as to whether the by-laws with respect to new streets and buildings in the Borough are not too stringent in operation in preventing the erection of the building referred to, and whether some modification of the by-laws might not properly be made so as to allow the erection of structures of the kind in question under similar circumstances. The Committee have decided to inform the Local Government Board that in their opinion the method of construction of the building was not desirable in view of the size and the purpose for which it was to be used, and that they did not consider that any modification of the by-laws was necessary. A plan has been passed for Mr. C. Living, for four houses, Claremont-street. A plan has been lodged by Mr. C. A. Nicoll for additions to factory in Stevenage-road.

Kensington.—The roadway of Aubrey-road is to be relaid with Kensington clinker blocks at an estimated cost of 128l. The footway on the west side of Pembroke-villas from Chapel-street to Chepstow-villas is to be reinstated and the kerb reset at an estimated cost of 119l. An application from Messrs. John Barker & Co., Ltd., for permission to extend the vaults and to reconstruct the pavements lights in connection with their premises in Wrights-lane has been acceded to.

Lewisham.—Eltham-road is to be repaired with granite bound with plasccon at an estimated cost of 400l. Plans have been passed for Messrs. Norfolk & Prior for three houses on the west side of Trilby-road.

Romford.—At the last meeting of the Rural District Council it was decided to accept the tender of Mr. B. W. Glenny, Romford, at 403s., for the construction of about 830 yds. of 12-in. and 18-in. diameter stoneware pipe band sewers, with manholes, etc., in the parish of Dagenham.

Watford.—The Urban District Council has accepted the tender of Messrs. Ensor & Ward, Watford, at 255s., for the supply and erection of the superstructure of a bandstand proposed to be erected in the park. They have also accepted the tender of Messrs. Clifford & Gough for supplying the foundation at 97l. and the pitch-pine floor at 47l.

West Ham.—The following plans have been passed:—Messrs. G. Munday & Sons, alterations and additions to No. 5, Albert-square, Stratford; Mr. R. C. Verlander, three houses, Oriental-road, Silvertown; Mr. R. Banks Martin, alterations to "Lord Nelson" beer-house, Bidden-street, Canning Town; Messrs. Stevens & Walker, alterations to Messrs. Russell Bros.' premises, High-street, Stratford; Messrs. F. & B. Horne, alterations and additions to No. 12, Wharf-road, Stratford; Mr. W. Harris, Conservative Club, Albert-road, Silvertown; Mr. W. Jackson, alterations to school, Russell-road, Custom House; Mr. J. W. Jeram, alterations and alterations to the Pure Bread Company's premises, Barking-road, Plawton; Mr. T. B. Blower, twelve houses, Preston-street, Silvertown; Messrs. Belfrage & Saville, ten houses, Prince Edward-crescent, West Ham; also four houses, King George-avenue, Connaught Garden Estate.

Custom House; Mr. W. J. Blackmur, cinematograph theatre, Adamson-road, Custom House; Mr. W. Stewart, alterations and additions, "Prince Edward" beer-house, Shilwell-street, Canning Town; Messrs. H. Tate & Co. Ltd., additions to factory, Thames Sugar Refinery, Silvertown; India-rubber and Gutta-percha Company, Ltd., factory at prent Silvertown; Mr. W. Gladding, various factory at Messrs. R. Ingham, Clark, & Co. premises, Abbey-road, West Ham.

Willesden.—The Engineer has been instructed to invite tenders for the wood-paving of part of Dyne-road. Sanction has been granted to the Education Committee to enlarge the junior mixed school in Wesley-road by 400 places. The following plans have been passed:—Messrs. W. Lawrence & Sons, architects, school, West Willesden; Mr. T. Kendall, seven houses, Mora-road, Crickwood; Mr. J. H. Fry, for Mr. H. H. H. eight houses, Odessa-road; Messrs. Meak Archer & Stoneham, for Messrs. J. A. L. L. and Co., additions to Stanley Works, Laton-road, Cricklewood; Messrs. Joseph Smith, for the London and North Western Railway Company, two blocks of artificial dwellings, Malvern-road, Kilburn; Mr. G. Paine, for Mr. M. Ward, six houses, Do Hill-lane; Messrs. Done, Hunter, & Co., Messrs. J. C. World & Co., seventeen houses, All Souls-avenue. A plan has been submitted by Messrs. W. Moss & Sons, for Dairy Supply Company, for a factory, Cumberland-avenue, Park Royal.

Wood Green.—The Surveyor has been instructed to prepare plans and estimates of cost of making up section 4 of Westdoro-road. The following plans have been passed:—Mr. G. Taft for Mr. E. A. Wyatt, two houses, Easton-mews, Lordship-lane; Mr. L. G. H. Luck for Messrs. Crosbie Bros. & Co., additions to glass factory, Bowd's Green-road; Mr. F. F. Tomlin for Messrs. Pilgrimage, new houses on site of Nos. 10, 12, 22, Stirling-road.

AUSTRALIAN COAT OF ARMS.

In the drawing reproduced on the next page the uppermost coat of arms is that of the Commonwealth of Australia, and the other symbols the State of Victoria. The shield charged on both shields are a conventional representation of the constellation of the Southern Cross.

The border introduces the characteristic birds, animals, and plants of the country. The centre figure at the top is emblematic of the abundant productivity of the country; the vine fills the rest of this border and the lower border. Wedge-tailed eagles are introduced in the top corners, a kangaroo in the lower corners. The characteristic curly-horned sheep occupy the central point of the side borders, while lyre birds and cockatoos are shown repeatedly. The drawing was prepared by a gentleman, a native of Victoria, Australia.

WORKMEN'S DWELLINGS, ST. IVES.

The Town Council of St. Ives have been negotiating with Mr. Glanville (agent for L. Cowley's estate) with reference to the acquisition of a plot of ground in the occupation of Mr. Dunn at Nangivay. The trustees of the estate were prepared to sell this land on certain conditions, and the Surveyor's plan of artisans' dwellings were considered.

NORTH BERWICK HIGH SCHOOL EXTENSION.—An addition to the North Berwick High School, involving a cost of about 3,000l., opened recently by Sir Henry Craik, K.C., M.P. Mr. James S. Richardson, Edinburgh was the architect. The additions consist of two portions. The one is a two-storied building, with basement, placed in the angle formed by the original building and the west extension, an attempt being made to show what has been a straggling series of rooms. In this portion accommodation is provided on the ground floor for the first and second intermediate classes, while on the first floor there is a room for the third intermediate class; the art-room—a well appointed and well lighted room. These are entered from upper story of the original building. To west of this building, and connected with it is a single-story building containing two rooms set aside for the elementary classes, and store for apparatus. The whole of the extension on the ground floor of the extension and the laboratory and the cooking room are set by a spacious and well-lighted corridor opening to the boys' and the girls' playgrounds and the gymnasium. The gymnasium has been fitted up with the latest equipment for physical exercises.

CLPAGE 1911

Coats of Arms of the Commonwealth of Australia and of the State of Victoria, with Emblematical Border.
Drawing by Mr. Charles L. Pace.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vi. viii. x.; Public Appointments, xvii.; Auction Sales, xxiv.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

- OCTOBER 4. — **Eslington R.D.C.** — 100 model houses for Merton Colliery, Durham. 24 per cent. on net cost to successful architect.

OBITUARY.

Mr. M. Rosenheim.

Mr. Max Rosenheim, F.S.A., whose death
was announced last week, was a leading
member of the Burlington Fine Arts Club and
a person of great national collection of
paintings, Kensington and Bloomsbury. Of his
collection of art works we may mention his
savings and XVth-XVth century German
Italian medals. We understand that he
bequeathed with his own hands the sets of
the heraldic engravings in the British
Museum.

Mr. J. P. Pritchett.

On the 22nd of this month there passed
at "Glendower," Teddington, at the age
of 71, Mr. James Pigott Pritchett, architect,
Barnstaple. He was born in York, May 14,
1840, and was educated at St. Peter's School,
Barnstaple. After serving his time with his father,
late Mr. J. P. Pritchett, of York (who
died on his own account in York for
five years), he joined him in partnership
in 1855, and in 1854 he succeeded to the
firm in Darlington of his brother-in-law,
late John Middleton, who removed to
London. From 1854 to about 1810 he was
engaged in an active general practice, though,

perhaps, he was best known for his
ecclesiastical work in the North of England.
His son, Mr. H. D. Pritchett, was associated
with him in the practice from about 1880, and
in 1900 was taken into partnership, and is now
carrying on the same. His works com-
prise seventeen cemeteries, chapels, etc., in
various parts of the country, twenty five new
churches, twenty restorations and additions to
churches, twenty-eight Nonconformist chapels,
sixteen parsonages, eighteen schools and Sun-
day schools, banks, training college at
Darlington, offices, hotels, and shops, and over
forty houses and cottages. He was surveyor
to the Cleveland Estate at Darlington. He
was connected with two or three archaeological
societies, and frequently lectured and gave
papers on archaeological subjects, and was for
a good number of years a Fellow of the
Royal Institute of British Architects.

Mr. S. Putney.

We regret to announce the death of Mr.
Samuel Putney, which took place on the
19th inst., at his residence, 2, Park-avenue,
Willesden Green, N.W., after an illness of
some few weeks. He was born in London on
November 3, 1824, was the founder in 1846 of
the well-known firm of timber and hardwood
merchants bearing his name, which, since his
retirement, has been carried on by his sons,

together with many of his old staff, at
Paddington and at other branch depôts in
London. In his early days he for several
years, in his leisure moments, studied the art
of oil painting and water-colour drawing
under the guidance of Frank Walton, Beale,
and other artists of known repute. Always a
lover of music, he played both the violin and
piano with considerable ability. He initiated,
patented, and manufactured the then new and
now perfected system of improved flooring
and wainscoting under the style and title of
"Putney's Pavodilos," for which he obtained
highest awards at the Inventions Exhibition,
London, in 1885, and again at the Liverpool
Exhibition in 1886.

FOREIGN AND COLONIAL.

Building Material for Southern Nigeria.

The *Lagos Customs and Trade Journal* of
August 17 contains a report by the District
Commissioner at Jebu-Ode (a town estimated
to have a population of 22,000, from which
it appears that there is a large importation
into that district of building material, such as
corrugated iron, nails, hinges, locks, bolts, etc.,
required in connexion with the construction of
churches and mosques. Almost every village,

says the Commissioner, has at least one iron-roofed church as well as a Mohammedan mosque. The report further states that a trade might probably be done in church furniture and ornaments.

Austria-Hungary.

Referring to the proposed construction of a new water supply aqueduct and the erection of a market hall in Mostar (Bosnia), H.M. Consul at Sarajevo reports that tenders are to be invited for these works and also for the construction of a bridge and of a slaughter-house. The cost of the bridge is estimated at 257,000 crowns (about 10,700l.).

Building Material for Brazil.

The *Diário Oficial* publishes a decree earmarking, in favour of the Ministry of Justice and Home Affairs, an extraordinary credit of 2,353,336 milreis (about 158,000l.) for the purpose of completing the building of police cavalry barracks in the Avenida Salvador de Sá, Rio de Janeiro.

Building Materials for Uruguay.

The *Diário Oficial* contains a notice, issued by the Ministerio de Hacienda, accepting the estimates submitted by Messrs. Acesta y Lara y Guerra, for the erection of three warehouses in the harbour of Montevideo at a total cost of 103,600 pesos (about 23,000l.).

PATENTS.

TO CORRESPONDENTS

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for their return.

ence, unless it has specially asked for them. The Editor's consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from intimation to this effect. The Editor should not contribute to write an article, or to execute or lend a design for publication, without being subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a copy of the article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be sent to the Editor, whether the author, whether they have been formally asked for or not.

H. CHATFIELD CLARKE, F.R.I.B.A., ARCHITECT.

LIKE all questions of method and policy, a system can only secure or maintain its place in the general scheme of human affairs if it shows itself to be in accord with what is usually assumed to be covered by the catchword, "the greatest good of the greatest number." Exception may be taken to this phrase as a mistaken mode of expressing the thing most desirable, indeed it is but a clumsy generalisation, but it must be made to serve even though it is not quite a logical formula for relative values.

Before applying this principle to

architectural competitions, we must briefly take stock of the various intentions of those who have in the past been in the habit of promoting competitions. Putting aside those vitiated in their intention by some dishonesty of purpose as unfortunate exceptions having no bearing on general principles, we can limit ourselves to those promoted with a single-minded intention of securing the best result for the object in view.

Now, the ideals of the average promoter are naturally limited according to his general standard of culture. Economy

in design and subsequent convenience in use will probably take first place in these ideals, a critical appreciation of artistic values coming a long way behind. The assessor, in the promoter's mind, is the man who will be able to select the design best fulfilling the requirements he (the promoter) has stipulated for, and some assessors have felt so strongly this point of view as to openly explain that they considered it their duty to identify themselves in their attitude of mind with the intentions of their employers. The more usual position for the assessor,

however, is for him to regard himself as entitled to give artistic claims a somewhat higher value than would be instinctively allotted to them by the layman; but even then, as a judge, he will probably consider that he is only carrying out the terms of his appointment in selecting what is to his mind the best designs having sole regard to the true interests of the promoter. Taking these as the lines on which competitions are usually assessed, we may fairly say that promoters institute them for their own benefit, and that the system of professional assessing gives them more or less the kind of design they expect.

We are not, at the moment, concerning ourselves with the capacity of the assessor or the advantages of the jury *versus* the individual. These issues do not affect the question of the true purpose of the competitive system. It is a very prevalent opinion that this purpose is to secure the best value to the promoter, indeed the American Institute has gone so far as to give official expression to this view.

It is this view we feel to be open to doubt. The R.I.B.A. displays a greater breadth of outlook in pronouncing that competitions are to be regarded as a means of promoting the interests of architecture, a definition sufficiently comprehensive, but which demands a certain amount of explanation. Does it mean, for instance, that by taking part in a competition a man improves his power of design? This may be true, but there are also other educational methods of as great or greater value. Does it mean that by giving opportunities to untried men it throws open the door to all the ability available? This, again, may be true, but the devil's advocate once more retorts that competitions as practised degrade the finer shades of genius. The axiom that competitions are in the best interests of architecture could only be accepted without reservation were they dealt with on the broadest architectural basis, and we propose to show that this is by no means the case at the present time.

To start with, the interests of promoters, even where they demand the best, are not necessarily the interests of the public; to take an example, it may be desirable to give up a portion of the site to improve the surroundings or the effect of the building at the cost of perhaps a little more compression in the plan of the buildings themselves than might otherwise have been desirable. We could quote several instances in which this line has been adopted by competitors, but not one in which it has led them to success. Again, sometimes the best course from the civic aspect might dictate a broadly-spreading treatment in lieu of a more compact and economical one, while other instances might be quoted to show that the more limited interests of the promoter cannot be identical with those based on public amenity.

Leaving this side of the question, we will take up another aspect. It may be claimed that the interests of architecture are best promoted by the exploitation of the most imaginative artist, but in the modern competition how would Dance's design for Newgate fare against one showing a 15 per cent. economy in cost and better facilities in its scheme of

control? As things are at present, awards are almost invariably made on too narrow a basis. Assessors are afraid to give the palm to a design possessing obvious defects, even when these are remediable, though it may appeal to their architectural instinct as artistically more inspiring than any other submitted. If the R.I.B.A. contention that competitions are promoted in the interests of architecture is to be maintained, this attitude is untenable, but, as a rule, the decision follows the national instinct for compromise, and the feeling of the assessor is that he will select what appeals to him as the best architecture, only if it does not prove too expensive.

Another aspect of the case demands consideration, namely, the influence of competitions on the education of the architect. The standard of architectural ability cannot be regarded as a matter of indifference to the general public, and we can fairly claim that the chief merits of the competitive system are that, if properly conducted, a competition urges men to exercise their faculties to the utmost, and at the same time throws open the door to the whole profession to offer of their best to the world at large. Looking first at the educational value of the system, we may unhesitatingly declare that this is the most important function of the competition, more than counterbalancing the loss of time and money to the profession so frequently set out as a serious, if not a conclusive, argument against the practice.

Now, this educational value is beneficial in a greater or less degree according as the awards are made in the interests of architecture or in those of architecture "adulterated," as it were, with those of an inferior quality, such as economics and other concomitants of the business of building. If the best competitive designs fall short of the best to be found elsewhere, it must be accepted that the full force of the educative influence is not being exercised; if they do not so fall short, we can claim that it is.

The advantage of the competition in educating the architect is hardly of more value than its possibilities in the way of educating the general public. That these are by no means exploited to the extent that they might be is by no means the fault of the system, and, with the increasing interest that is being taken in architecture in general, there will inevitably be an increase of interest on the part of the public in competitive designs. We can hardly conceive a more illuminative experience for the layman than a study of the conduct and result of an important competition with the aid of a well-studied expert criticism of the whys and wherefores of the decision.

To sum up, we may claim that the purpose of the architectural competition is twofold, and that the less important aim is that of securing for the promoter the building which most nearly fulfils his demands. This, by itself, would not be sufficient to justify this method. The more important object, and the one that does justify it, is the interest of the nation and its architecture as a whole, which is effected in well-conducted competitions, by the manner in which they can educate the architect, educate the public, bring the lay employer into touch with the best

ability, and offer opportunities for the broad treatment of building problems owing to the acceptance of a design being supported by influential professional advice. Of course these claims can scarcely be made for a large proportion of competitions as conducted at present, but the recognition of human fallibility does not preclude our arriving at a decision on the abstract merits of a system and the achievements it may make possible.

THE FUTURE OF THE ARCHITECTURAL ASSOCIATION.

 HE interesting Presidential Address delivered by Mr. Gerald Horsley at the Architectural Association shows a full appreciation of modern tendencies and the need for a broad outlook and a wider culture in dealing with the architectural problems of the future.

That the Association is alive to the necessity of reform, to keep in touch with the advance in education that has been so noticeable lately, is shown by the appointment of Professor Pite as Director of Education, with a view to a more complete reorganisation of method.

As the President states, "The development of this scheme might necessitate at some future time such a co-ordination of the means of study as might lead to the formation of a great National School of Fine Art and the crafts of building in this country, of which our schools would form a recognised part."

This seems to strike the right note and to be the true ideal towards which the policy of the Association should be directed. Indeed, it may be said that, if the Association does not wish to outlive its sphere of usefulness, it is the only possible ideal.

There may be some who regret the change of the old order—but what avails it to regret the inevitable? The Association was started under very different conditions to those which obtain to-day. No systematic training was then possible, no day schools existed. To pitchfork a boy fresh from school into a busy office, with permission to pick up any scraps of stray information he happened to find lying about, was considered the height of wisdom, and the best method to produce worthy successors to William of Wykeham or Inigo Jones. Few students had the President's good fortune to be placed in the care of a distinguished artist.

Under such conditions it was natural that the organisation of the Architectural Association should take the form more of a mutual aid society than of a school. This was all that was possible at the time, but in these days it is no longer even possible. That the Association has recognised this and determined to part with old traditions in this respect is a proof of its vitality and a promise of its future usefulness. As the President realises, "The most important work of the Association is the School of Architecture, the successor of the old voluntary system of education for which the Association was primarily founded."

In referring to the proposed advance school, Mr. Horsley rightly points out

it does not presuppose any slavish imitations of the French school, though may learn much from it. The great end of architecture here and now—the principal work of the schools of the future—seems to be the systematic study and the right understanding of the principles and theory of architecture, the gradual building up of a technique, definite and generally recognised method whereby a building may be made to express the ideas suitable for expression in architecture. The French school is universally recognised to be the one which has the highest standard in this respect. We want no slavish copy of the forms and features in which their theory and technique find expression. We need to get behind the forms and understand the method—the point of view. If we must copy, let us copy them in this, and build up a method of expression suitable to our national requirements and different racial characteristics.

In these days of technical institutes in which the various crafts that go to make up a building are everywhere so thoroughly taught there is a danger that the student may learn every craft but not the art of architecture. And, considering the facilities in this respect to be obtained everywhere, it is just a question whether the Association should not concentrate its energies in creating a school of design, an architectural expression only, leaving the student to obtain his mathematics or his sanitation at institutions specially adapted for that purpose.

NOTES.

"Cheap" Churches. THE little pamphlet on "Cheap" Churches, issued by the Incorporated Church Building Society, takes the form of the now fashionable "symposium" in which the views of several eminent architects are extracted from their speeches and writings on the subject. Wholesome earnings are given as to the difference between true and false economy, putting the matter even on the lowest basis of the practical requirements. Mr. W. D. Caröe affirms that cheapness in building involves with unerring certainty dearth of upkeep. Further on in his remarks Mr. Caröe makes a special note of the undesirable type of church in which, as he says, "Precisely the same set of plans and details and the same specification are used again and again, no matter what the site or the locality." We welcome Mr. Caröe's conversion from the dark days when his name was connected with lithographed plans and specifications of parsonages offered as models for use throughout the country. We do not now if these plans have yet been withdrawn, but, if not, the fault cannot be said at Mr. Caröe's door after he has expressed himself so clearly. Mr. Charles Spooner recalls the impression created by Bentley's great church at Westminster as an illustration of the fact that an absolutely plain church without moulding or carving may be a very noble building, while Sir C. A. Nicholson differentiates neatly in his remark that "There is no harm whatever in building a cheap church provided it be solid and sufficiently

spacious. The harm comes in when people try to build showily as well as cheaply, when they starve the roof-tree so that they may gild the altar."

The Architect's Garden. In another column (p. 401) we quote an article from a contemporary that strikes us as exhibiting an exceptionally clear appreciation of the relationship between architect and client, generally as to the house, and particularly in regard to the garden. The article closes with a hint that the garden is hardly likely to remain just as the architect leaves it. Now every architect who is himself a gardener knows how inevitably the garden will in time suggest modification and improvement beyond what may have been foreseen from the start, and he will sympathise with a client's desire for opportunities to initiate in this respect. To begin with, the architect should know enough of garden work to be able to fulfil his client's demands in the same way and to the same degree as he would in the arrangement of the house, by this means giving what is wanted in so far as it is not incompatible with the harmony of the whole. Afterwards we should hope that the friendly relationship between the two has sufficiently cemented itself for the client to invite the architect's co-operation, just in a little sociable chat, when a development of the garden scheme is in contemplation. The proposals are not likely to suffer from skilled professional criticism; in all probability the architect may be able to offer valuable suggestions, while at any rate he would have the opportunity of drawing attention to any features out of keeping with the existing work.

The Survey of London.

THE chronological survey of the City of London and its antiquities, in which the Joint Congress of the British Archaeological Association and the London and Middlesex Archaeological Society has been engaged, came to an end last week, when some monuments of later periods, Stuart and Georgian, were visited. Mr. Charles E. Keyser, President of the British Archaeological Association, speaking at the Mansion House, expressed the wish that everything they had seen could be preserved. Referring to the case of Crosby Hall, he said it was a disgrace that it had been removed. Of course. As far as the City of London is concerned, and indeed as far as all those who take more than an architectural interest in the matter, Crosby Hall might as well have been destroyed outright. It possesses no significance and hardly any beauty where it stands. The Lord Mayor, than whom few tried harder to keep the house where it grew and stood, in reply, said that, as regards Crosby Hall, the fact that the ground would fetch two millions an acre had proved too much for them. And is likely to do so. As the speaker said, all sorts of propositions had been made with regard to the City churches. And so on. Now, as a community either we value these things or we do not. If not, there is nothing more to be said. If we do, however, let us value them at their true worth—that is to say, as

objects absolutely valuable—"absolute" because unique and irreplaceable. And let us remember that their value lives only so long as they stand on the spot on which they grew. With this attitude of mind an old City becomes an area on which there stand strangely-shaped hillocks and cliffs of adamant. All additions and alterations must be in relation to these irremovable features. For the planner and improver of streets and public spaces these old buildings are as natural features of which advantage must be taken, which it is a confession of incompetence to remove. One sees them not as obstacles, but as jewels awaiting their setting. But, of course, if we care more for the number of pounds per acre . . .

The L.G.B. and Civic Aspiration.

THE steadiness with which occasions arise for adverse criticism of our central government authorities in architectural matters must be as apparent to our readers as it is distressing to ourselves. The case of Oldham Town Hall appears on the face of it to betray an attitude of petty parsimoniousness on behalf of those under its supervision by the Local Government Board which is surely a labour of supererogation, if we are to look upon it as the policy of the Board with regard to municipalities generally as they are constituted today. We say "on the face of it," because it is easy to imagine the existence of a variety of circumstances which it might not be thought politic to disclose that would justify the Local Government Board in the instance under consideration; but if this is the case the Board cannot but stand condemned for considering secrecy desirable in affairs of this kind. Oldham possesses a Town Hall of which apparently her citizens are ashamed—but we let that pass as not being relevant to our contention—a Town Hall which is at any rate inadequate in point of accommodation. It is proposed to remedy this by building an addition at a cost of about 30,000. The Board has criticised the scheme, suggests that it is not as cheap as it might be, and indicates amendments which would reduce the cost by a few hundred pounds; shear the addition, that is to say, of the architectural amenities which would render it a source of pride to the town and reduce it to a condition of starkness which would be consistent with a mistaken conception of "utility." As the *Oldham Standard* has it: "Now, however, when it is proposed to do something on a substantial scale to supply the want, the Local Government Board, influenced by goodness knows what, must interfere to checkmate us. We must apparently attempt nothing elaborate or attractive, and our public buildings must remain an eyesore." And again: "None of them (the Town Council) thought that Mr. John Burns, of all men, would charge them with extravagance when they attempted to remodel the Town Hall along lines that would, at least, make it creditable to the town from an architectural standpoint." This, surely, is an outcry in the right spirit, apart altogether from the architectural merits of the scheme.

The Empire Palace Fire.

THE British Fire Prevention Committee's report on the Empire Palace fire at Edinburgh, which has been drawn up by Mr. Ellis Marsland and Mr. Max Clarke, gives a clear and instructive description of this catastrophe. Apart from the unfortunate loss of ten lives, the course taken by the fire shows that progress has been made in the construction of theatres as regards the separation of stage and auditorium, and had the arrangements of the dressing-rooms and their approaches been equally good several more lives would have been saved. As our readers may recollect, the audience all escaped uninjured, despite the error of judgment which allowed the drop curtain to be lowered before the fireproof one, the consequence being that the former was drawn out by the draught towards the auditorium, preventing the latter from coming right down. Even then the damage in front was trifling, and while this mistake may have contributed to the ultimate failure of the fireproof curtain, this stood for eighteen minutes—a more than sufficient time for the exit of the audience. We confess that we should be better satisfied if the curtain had not failed, considering that it is clearly practicable to design one strong enough to resist. In this case it hardly seems to have been sufficiently stiff in its construction and drew out of the guides, which were formed by a pair of Z bars screwed through a back plate. There appears no reason why the curtain should not run in grooves formed in brick or concrete, so that, if in itself sufficiently stiff, it could not fall away from its position even if the metalwork in the guides succumbed to the heat.

The Disaster at Austin, Pennsylvania.

THE collapse of the dam at Austin, which has caused so deplorable a loss of life, has called to mind the apparently somewhat similar disaster to the Connemaugh Valley dam at Johnstown, Pennsylvania, in 1889. As a matter of fact, the similarity is more apparent than real. The Johnstown dam was formed of clay puddle, and its failure was due to many years of neglect, while the Austin dam was a new one constructed of concrete. In this case the information at our disposal leaves it open to doubt whether the failure was due to faulty work or to the unfortunate habit too prevalent in the U.S.A. of designing with an insufficient factor of safety—of cutting things too fine, to use a colloquialism. The length of the dam, 530 ft., appears to show that it must have been what is termed a "gravity dam," and the fact that it began to leak

soon after its completion some eighteen months back points rather to faults of workmanship than of design. The full history of the failure will doubtless be studied with interest by the engineer whose work lies in this direction. In these days of reinforced concrete the design of the actual dam wall presents trifling difficulties compared with those involved in making a sound connexion between the wall and the ground on which it is founded.

Railway Nationalisation.

THE annual meeting of the Amalgamated Society of Railway Servants has come at a somewhat unfortunate time, as the matters with which it is concerned are *sub judice*, but it has enabled the public to compare the statements made on the platform by the President as to the condition of railway servants and their grievances with the evidence offered before the Royal Commission by persons on both sides giving evidence with a due feeling of responsibility. The leaders are in a position of difficulty as regards the Irish strike, which has, at any rate, exhibited the inability of the Society which claims recognition to control its members in times of difficulty. The recent strikes and the intervention of the civil and military forces appear likely to be used in certain quarters as an argument for nationalisation of the railways, but the intolerance expressed of any Government interference in trade disputes, coupled with the experience of some countries where the railways are State-owned, would seem to indicate that the remedy for the present trade union unrest does not lie in that direction.

Oriel College, Oxford.

NOT the least interesting chapter in the history of Oxford is that relating to the advent of the late Cecil Rhodes. Although Rhodes went to Oxford with an unusually matured mind, there can be no doubt that the traditions and spirit of the city had a strong influence on his future. He himself admitted the fact, and by his interest in the University he showed that he was prepared to repay the debt of gratitude. A few days ago, when the new buildings of Oriel College, designed by Mr. Basil Champneys, were opened, Dr. Shadwell, the Provost, gave an interesting address on the history of the College, and reminded his audience that it was barely forty years since that Cecil Rhodes had applied for admission to Oriel. In the interval much has happened in South Africa towards the achievement of the ideals of the pioneer who, "ever looking North," conceived vast schemes for promoting civilisation. But while he was engaged so strenuously

on the veldt he never forgot the seat learning on the banks of the Isis, and through his benefactions, apart from other well-known endowments, Oriel College possesses now a building which is a monument to the generous donor efforts towards the spread of education. The moral of the gift is one of significance to the Empire.

THE STORY OF THE BRIDGE.

By WALTER SHAW SPARROW.

VIII.—ARCHITECTS AND BRIDGES.

ARCHITECTS have managed to drift apart from a good many things essential to the high office as the most useful of all public servants. For example, the people ought to be encouraged to consult good architects in all matters of domestic furnishing and decoration. Yet architects have no consulting hours for that purpose, and they have got into the habit of believing that the main work is to build homes, though show syndicates degrade new houses with clever estimates recommending seasonal fashion. Again, towns and railways ought to get opinions from the Royal Institute of British Architects before they invest money, plus the good looks of several neighbourhoods, in the construction of new bridges; but what layman would support that view? How many persons now regard bridge-building as within the province of architecture?

Civilians lift their eyebrows with astonishment if you suggest that truth to them; and even some architects have declared that they have looked vainly for fine art even in old historic bridges. This attitude differs greatly from the deep affection for bridges that painters and etchers have been glad to express. Piranesi etched bridges nobly. Turner's poetry wandered along them to and fro between the past and the present; and every landscape of note has put something good from their romance into his pictures. Whatever architects may feel about scientific engineering—a thing hateful to me as a rule—they surely cannot be blind to the variety of apt excellence that gives grace and charm to many an old bridge which for hundreds of years has served the passing generations.

If engineers, like the architects of battleships, had been obliged by public opinion to keep their designs in step with the progress of gunnery and explosives, they would certainly have evolved many bridges having a much greater value than the industrial types which they have invented. How to safeguard piers without obstructing river too much; how to give the superstructure all possible refuge from falling shells; what the maximum span of an arch should be in its relations both to temporary and swift repair and to the stress and strain of war these problems, and many others, if engineers had been obliged to concentrate thought or their solution, could not have failed to inspire great efforts and to bring into vogue new constructive methods and powerful designs.

Conformity to definite and urgent needs, making each useful thing as fit for its purpose as it well can be, is always an agent in the

ILLINOIS & ST. LOUIS BRIDGE

Over the Mississippi.

(For the best description see Sir Charles A. Hartley, quoted by Professor Fleming Jenkin in his "Monograph on Bridges.")

Bridge of Notre-Dame at Mende, Lozère, over the Lot.

of building. Utility does not produce
ness when all the special requirements of
ery case receive from experts as much
ention as they deserve. A fleet of metal
ships is not ugly, for instance; it is
traordinarily impressive. Every thorough
hitect recognises utility as the basis of his
ork, and on that sure foundation he makes
autiful buildings. His art is tradition and
mon sense in perfect harmony with the
eds of to-day and enriched with imagina-
on. Something very different appeals to
s when we study the work of scientific
gineers. Here, as a general rule, imme-
ate convenience for purposes of trade has
ominated all other considerations, with the
sult that those bridges which are not
onsters of ugliness like the Britannia
ridge are very often too big for their
roundings; and can you name even one
hich is not defenceless and very vulner-
le? We know, too, that Parliament with
pathetic stupidity, granted powers to railway
panies that enabled them to deface
oroughfares, to destroy the beauty of
ighbouring architecture, and to disfigure
landscapes with much bridge-building that
ill long remain as a national humiliation.

Leading architects have protested often
nd earnestly. I may take E. M. Barry as
n example. In his lectures from the archi-
tural chair of the Royal Academy they were
elivered between 1874 and 1879—he spoke
is mind on this question of bridges, regard-
ing it as a compromise affected by many
fluences: cost of production, the utilitarian
pirit, the defects of taste and of design
hat seem to be inseparable from engineering,
he value of beauty to a nation, and so forth.
He said, among other things: "The greatest
works of the present generation, those of
cientific engineering, are not architecture,
nt mere building. In them the actual
ecessities of construction have alone been
recognised, with the results that may be
een, for example, on the Surrey side of
ondon Bridge, where one of the finest old
hurches we possess is hemmed in by iron
tructures of surprising ugliness. If archi-
ecture were felt to be a matter of public
nterest, any such disfigurement of our

public places would not be permitted; and
while the argument of utility must always
have great weight, it would be carefully
scanned, and not be permitted, as a matter
of course, to override all other considera-
tions. . . . Take an instance of bridge-
building. The Menai Straits are spanned by
two bridges. The problem was the same in
each case, viz., to carry a roadway across the
Straits at a great height, and with the least
possible interference with the navigation.
The one bridge—Telford's—was necessary
for the turnpike road; the other had the
more difficult task of supporting the great
weight of a railway. . . . Here we have
the adoption of the trabeated principle of
large iron beams laid upon supports of
masonry, which rise from the valley beneath,
and tower up above the beams to a height
far exceeding that which is necessary for
their support. I well remember the animated
discussions in scientific circles as to the form
and design of these beams, which were
ultimately decided upon as rectangular tubes.
In the many discussions of the merits and
defects of circular, elliptical, or square
sections, I do not recollect that a word was
said of architectural effect. Had anyone
ventured to suggest that this, too, was an
important matter, and that an unsightly
structure would be an eyesore for all time,
he would have been promptly told that the
forms to be employed were an affair of
science alone, and that utility pure and
simple would dictate their arrangement. In
the result a lovely valley was defaced by one
of the most unsightly structures of this
mechanical age."

And that was not all. Even the distribu-
tion of metal in the section of the tubes was
soon questioned, and a very different design
was chosen for the next great work in the
science of hideous bridge building. I refer
to the High-Level Bridge at Newcastle,*
with its two roadways, the one for carriages
passing under the railway so that business
folk may be reminded by the noise overhead
that they are natives of a very pushful
industrial town. There are six arches, all

of the same width, namely, 125 ft., for a
practical mind, long used to ledgers and
routine, likes a dull uniformity. Much ado
was made about this bridge, and Queen
Victoria opened it in 1849. The "Encyclo-
pædia Britannica" described it at great
length, giving more space to its planning
than the frugal Romans would have granted
to half-a-dozen great viaducts. People were
proud that the new monster had cost
243,000*l.*; that 4,728 tons of cast-iron had
been used for the arched ribs, and that the
ties of wrought-iron weighed 321 tons.
Engineers boasted that the bridge was a
perfect example of the true bowstring arch
in which no cross-bracing was necessary.
And then, all at once science refused to brag
any more; she became thoughtful and very
critical. This was shown in the next edition
of the "Encyclopædia Britannica," which now
gave no more than eighteen lines to the
High-Level Bridge at Newcastle. All the
old praise vanished, and readers were told
that the bowstring type could not be recom-
mended for imitation, being essentially more
expensive and heavier than a true girder.

Even when we turn to those metal bridges
that show in their design some grasp of
æsthetic principles, we find that art and
science have not been combined together
after a thorough study of all considerations
involved in the purpose of a bridge. As an
example we will take the Illinois and St.
Louis Bridge, a fine work of its kind, dating
from 1873. It crosses the Mississippi, which
at St. Louis flows in a single channel 1,600 ft.
wide and 8 ft. deep at extreme low water.
There are three metal arches, the middle one
having a span of 520 ft., while the others are
18 ft. narrower. If it was worth while for
the sake of public convenience to erect this
great roadway above a wide and dangerous
river, it was also worth while for the sake
of public convenience that the width of the
arches should be determined by the probable
dangers to which the bridge would be exposed
in a time of war. Would it be possible
temporarily to mend a metal arch having a
span of 520 ft.? If not, why build a huge
and costly structure with steel-ribbed arches
of that size, which might be destroyed at

* Illustrated in Article VII., p. 323.

the very moment when a double railway track across the river, and a roadway above for other traffic, might unite an attacking army to its supports and determine the issue of a critical battle?

These questions were not considered at all. Many authorities will tell you how the St. Louis and Illinois Bridge was built; how the arches were erected gradually from each pier and abutment without the aid of centring; how four double ribs of steel in each span were formed with tubes jointed butt to butt, and braced well together at their relative distances from each other; how they were clasped together by wrought-iron couplings furnished with parallel grooves corresponding with similar grooves in the tubes; how steel pins, varying from 4½ in. to 7 in. in diameter, passed through the centre of the couplings and the ends of the tubes at every joint; and how the vertical bracing between the upper and the lower tubular ribs, which were 12 ft. apart from centre to centre, made the two members into a single arch. This and other information was given to Sir C. A. Hartley by the engineer, Captain James B. Eads, whose design showed a want of military forethought quite in accord with the routine of scientific bridge-building.

For Captain Eads was no different from European engineers. Custom is reason either half awake or fast asleep, and custom in the modern science of engineering has never given any thought to the simple questions: "Is this bridge as fit as it ought to be as a safe roadway? Could it be destroyed by a strike of workmen armed with explosives, and could a breach in any arch be repaired quickly for the passage of troops and provisions during a time of national crisis?"

Instead of getting answers to these questions, by which the precise worth of a modern bridge is made evident, we have been assailed by details of technique and by the cost price of materials. We were expected to gape with admiration because Captain Eads gave 60¢ per ton of 2,000 lb. for 2,500 tons of steel, and 40¢ per ton of 2,000 lb. for 500 tons of wrought-iron. A target of much gold for modern artillery!

Well, now, are we to suppose that architects would ever be as blind as engineers have been to the utilitarian factors governing the use and worth of bridges? Would they have forgotten such great things as the

perils of war and the dangers of strikes? Or would they have lost their care and liking for beauty in nature and in design? After reading about the fate of bridges during Napoleon's campaigns, could they have been so unwise as to build in metal many hundreds of vulnerable structures which to-day's artillery would ruin with even greater ease than the gunpowder of 1799 destroyed the great timber bridges of the brothers Grubenmann?

One cannot answer these questions affirmatively. Capable architects have the genius of artists, and artists, whenever they give their minds to practical matters, have a range of common sense that men of affairs never equal. Artists look at questions from all sides and see them amply and as a whole. It is the man of affairs who isolates two or three things from many, and believes that those two or three things are all that need attention. "It is unnecessary for these bridges to be handsome," said the railway companies; "we need them for business." This decision was repeated many times. Years later, when railwaymen break out into civil war, the public suddenly is told that scores of bridges useful in business are in need of troops to guard them from the striking classes. Engineers built those bridges, for their practicalness was limited by routine and trade; it was mere business without imagination and art.

But the main trouble is that architects cannot easily regain what they have allowed to slip away from the control of their criticism. In this question of bridges engineers hold the field, as governing bodies find in their work that degree of practicalness which is patent to business minds. Apart from this, it will take a long time to convince the public that bridges belong to the most perilous necessities of the national life. This was realised to some extent during the railway strike, but we cannot point out too often that a country dependent on imported food, and subject to periodical conflicts between labour and capital, must have bridges in all respects fit for their purpose as secure highways. A country with cut bridges would be like a man with severed arteries.

What we need at the present time is a Committee of architects and engineers having for its duty the examination of all

new projects in those forms of civil engineering that affect national interests. It should be a Committee of judges, not a Committee of working barristers. That is to say, the members should devote all their time to impartial work and the testing of evidence; they must have no axes to grind and no professional theories to advocate. At present time, when the majority of architects condemn a bridge newly projected, there is always a minority that takes sides with the engineers and the men of trade.

From these current affairs and the mud that England loves one turns with pleasure to a few of the old bridges, because they show in various ways the presence of genuine architecture. The XIIIth-century bridge over the Lot at Mende, in Lozère, is humble and rustic, built by a master mason probably but not the feeling for stone in the simple and effective masonry. Here is a little bridge that found its way into art because it was built by craftsmen who loved the work. It is in harmony with the country side; it belongs to its site and neighbourhood. Pull it down, and tourists would feel the loss of an old friend.

As to the famous bridge of Avignon, built by Saint Bénézet and the Bridge Fria between 1178 and 1188, its history has been told many times. Only four arches now remain, but they are of great interest to students. Professor Jenkin noticed the elliptical outline with the radius of curvature smaller at the crown than at the haunches "a form which accords more truly with the linear equilibrated arch than the modern flat ellipse with the largest radius at the crown." There is no other bridge of the XIIIth century having arches of this kind.

It is said that Bénézet performed miracles, healing the sick; but his eighteen arches of Avignon ought to have been enough to satisfy his ambition. He died before his work was finished, in 1184, and his body was entombed in the Chapel of St. Nicholas built on the third pier. The tomb became a shrine that pilgrims visited; and the chapel has never been injured by feuds or by floods. War destroyed some of the spans in 1385; three others fell in 1602; and in 1670 several piers were overthrown during a thaw and flood that came after a very severe winter. The Rhone was frozen over and when the ice began to melt and break

Trier Bridge over the Moselle.

immense damage was done. The original length of the bridge was 600 metres. As contrasts to St. Bénézet's work illustrate the Moorish bridge at Toledo, the achievement as a whole, and the older Bridge across the Moselle, that still retains its religious symbols midway in its length. For many generations a crucifix was used above the parapet in the middle of a ridge, and sometimes, as at Trier, a statue of the Virgin was eniched below. The Trier bridge should be studied side by side with the Moselle Bridge at Coblenz, illustrated in the issue of September 22, and which dates from the year 1344. The Moselle Bridge, with its fourteen arches, is 1,100 ft. long; the masonry is good freestone, and the sign is architectural. When we compare these venerable types of bridge architecture with the spindle-shanked modernities to be found in Canada and the U.S.A., who does not feel the threatening difference between our age of speed and the slow evolution that ruled over progress when art and craft had stern traditions?

The annual general meeting of the Architectural Association was held on Monday night at Tufton-street, Westminster. Mr. Gerald C. Horsley (the President) in the chair. Thirty-six nominations for membership were received. It was announced by the Chairman that a vacancy had occurred on the Council due to the resignation of Mr. P. W. Lowell. At the next meeting the Council would suggest a candidate for election, but under By-law 37 any member could nominate a candidate.

- The Prizes.**
- The President proceeded to present the prizes won in session 1910-11 by the following students :-
- G. W. Home—A.A. Silver Medal (see p. 401).
 - C. F. Butt—Architectural Union Company's prize.
 - W. J. Durnford—Banister Fletcher Bursary.
 - T. F. H. White—Banister Fletcher Bursary; Drainage and Water Supply.
 - A. G. Shoosmith—Class of Design Prize.
 - H. J. H. Dicksee—History, First Year; Construction, First Year; Geometry, First Year; Physics, First Year; Studio Prize, First Year.
 - B. C. Davies—Freehand Drawing, First Year.
 - D. J. Gordon, Travelling Studentship, Second Year.
 - End of Session Test, Second Year, Prize offered by H. P. G. Maule.
 - E. Kennedy Smith Scholarship, Preparatory courses.
 - J. B. M. Walch—Preparatory Course; Geometry; European Medieval Architecture.
 - J. A. Hale—Master's Prize, Preparatory course.
 - A. R. L. Roberts—Scholarship, Third Year.
 - G. W. Stuart—Book Prize, Third Year.
 - T. F. Ford—Master's Prize, Third Year.
 - H. V. C. Curtis—Travelling Studentship, fourth Year.
 - C. W. Marles—Master's Prize, Fourth Year; fourth Year Book Prize.
 - C. J. McCausland—Preparatory Physics.
 - A. B. Peermahomed—Intermediate Physics.
 - G. Fildes—Renaissance Architecture; Greek and Roman.
 - E. H. Bagnall—English Architecture.
 - C. M. Cooper—Advanced Physics.
 - G. A. Fortescue—Ventilation, Lighting, and Heating; Professional Practice.
 - H. Gresswell—Materials.

C.P.R. Bridge, Lethbridge, Alberta, Canada.

The following students have been recommended by the External Examiner, Mr. Paul Waterhouse, for the Board of Architectural Education Certificate, which entitles them to exemption from the R.I.B.A. Intermediate Examination :-

A. S. G. Butler.	J. O. B. Hitch.
F. A. Crouch.	L. D. Martyn.
G. A. Fortescue.	C. W. Rogers.
B. P. Gaymer.	

The following students have been awarded the Association Two Years' Course Certificate :-

M. D. Archer.	G. Fildes.
J. A. Bennett.	D. J. Gordon.
D. E. Cruickshank.	W. Harkess.
P. G. Detmold.	E. J. T. Lutyens.
T. W. Dowsett.	A. B. Peermahomed.

Presidential Address.

The President then delivered his Presidential address, as follows: "Before I begin what I may call the more serious part of my address I would like first of all, as your President for this session, to have a word with you about our Association. The Architectural Association has already travelled far upon the road towards fulfilment of the ideal of its founders. I like to think that that ideal was to inspire in its members a true love of art rather than a mere desire to be successful business men. This was the aim of a band of young architects, the founders of our Association, sixty-four years ago. As the first President of our Society, the late Professor Robert Kerr, said a few years ago, when speaking of its origin and the conditions of architectural training at that time, 'The time had come for a stirring of dry bones. It was not the seniors, but the juniors themselves, who made the demand—that there should be supplied to the inquisitiveness of youth something more up-to-date than all this' (referring to the architectural training of that time). 'Why not take the matter in hand for themselves?' said young Charles Gray and others. 'Why not, indeed?' said Donaldson and Godwin. So they did it; and the upshot of it has been that, not only in London alone, but in other centres of English energy, it has become a first principle in our professional training that the young men shall put their own shoulders to the wheel as an organised body. And well, thoroughly well, has it answered." So will it ever be—enthusiasm is with the young. Here are a few figures in proof of the steady growth of the Association. The present number of members is 1,611, exclusive of those nominated to-night. This time last year it was 1,589. Thirty-five years ago it was 668, showing a growth since that time of about 1,000. The number of students also in the classes from the foundation in 1847 up to some ten years ago, when the schools were placed upon their present basis, was a varying number in proportion to the number of members at the time. Since 1901, when the present schools were formed, the number of students who

have passed through them is about 1,500. These numbers surely speak well of the work done in furthering the aim and ideal of our Society. The "Brown Book" states the objects of the Association to be as follows:—"To promote and afford facilities for the study of architecture, and to serve as a medium of friendly communication between the members and others interested in the progress of architecture." It goes on to say that the objects shall, as far as practicable, be carried out by means of papers and discussions, a library, lectures and classes, a school of architecture, prizes and scholarships, visits to works and buildings, periodical publications, and by such other methods as the Council may determine from time to time. A goodly list. The communication between the members fostered by these methods has led to the formation of many valuable friendships, and will lead to a good many more, for the different societies within this Association which encourage informal but useful meetings among our members are all doing as well as we could wish. The Camera, Sketch, and Debate Club, for instance, has thoroughly justified its existence. Last session it held an excellent exhibition of very good sketches and first-rate photographs, and it has had some good debates. I believe to-day it has just returned from a week-end visit to Cambridge. I hope we shall soon see the result of their sketching and photography in another exhibition. I would commend to its members a consideration of the advantages of joining the A.A. Annual Excursion, in lieu of holding a separate outing of their own in the same month.

Social Activities.

Owing to the papers which are read, and the discussions which follow them, at our ordinary meetings, these are social gatherings as well as opportunities for hearing about something we probably knew nothing about before. We have gained greatly by the departure made last year in combining the alternate meetings with the Camera, Sketch, and Debate Club. We have had good meetings and animated discussions. I would like to remind you that the papers which are read at our meetings are usually of a most interesting description. They help to widen a man's general knowledge of art, and we hope to see our younger members coming forward and taking part in the discussions. The library and the periodical publications have made great progress in the last few years. A comparison between our present Journal and the old A.A. Notes must be very satisfactory to the editors of the former, and emphasises their admirable work. The "Association Sketch Book" has, I rejoice to say (as an old past member of its Committee and an old contributor I regard it with particular affection), a new lease of life. Undoubtedly the most useful and best book of its kind, it has at last been discovered by

many who previously have closed their eyes to its merits. In consequence of this it is becoming valued as it ought to be. I hope, as members of the Association, you will support it by lending your best drawings of old work for publication and by subscribing the small sum necessary to have the volumes supplied to you. We have had good competitions for the prizes and scholarships. I am glad to tell you of an alteration which has been made in the conditions of the Travelling Studentship. Formerly this was reserved for those members only who had passed through the School of Design; now it is open to the competition of any member who is under twenty-six years of age. Page 110 of the "Brown Book" will show you that this prize is now more than ever well worth your notice.

With much pleasure I wish to call your attention to the exceedingly good provision which has been made for the athletic side of the Association. Thanks to the untiring efforts of Mr. Alan Potter and other members of the Committee, a very good ground has been secured and prepared for football, cricket, and hockey. On a memorably fine and perfect afternoon last summer the ground was opened with much graciousness by Lady Webb, to the great satisfaction of all present. Now I need not say much more about the Athletic Club; it can take good care of itself. But I will say this: We ought all to support it. We all have to put in much intellectual work nowadays, and to keep fit intellectually we must keep fit bodily, and the Athletic Club will help us in a particularly delightful way. Do not overlook in your "Brown Book" the page which gives you information concerning the well-known 28th Battalion of the London Regiment, the "Artists." Fortunately, for the good of us all as citizens of this Empire, it is no longer necessary to tell the public school man on taking up his own citizenship that it is his duty, if he can pass the necessary tests, to join the Territorial Force. The splendid work done by the O.T.C. in the schools of England has spread that knowledge wide. I consider we ought in this Association to either supply a company to the "Artists" from the fine material we have here or to make notable additions every year to those companies already existing which are mainly recruited from architects. As one who did his few years in the regiment, many years ago now, I can testify to the good of the work and the pleasure of the comradeship. In view of the duty to our country in this respect, there ought to be an effort made to give facilities to those students who have to complete their drills.

The A.A. School.

The large subject of the School of Architecture I deal with more fully presently, but this I will say, that, after many years of voluntary and disinterested endeavour, the Association has a school which is second to none in this country. When I consider its well-thought-out scheme and many advantages I am forced to think of the more simple conditions which obtained when I and my contemporaries left school in order to study architecture, some thirty years ago. Perhaps you will not think me too prolix, or too much like the old man whom you know "will be talking," if I recall my own beginnings and compare them with your own. It was my good fortune in 1879 to be articled for three years to Mr. R. Norman Shaw. You can guess they were happy years. There was much to learn, much to inspire. But at that time there was no organised system of education beyond the term of pupillage, except the instruction given in the evening at the Royal Academy Schools, in some art schools, and the voluntary evening classes of this Association. We (I speak of myself and my contemporaries), or most of us, joined the Royal Academy Schools during the term of our pupillage on submitting drawings to prove our fitness for admittance, and worked there in the evenings. On looking back I think the chief value of that school work was the competitive work for the prizes. It was a good exercise, and lasted some time, for the Academy studentship alone lasted some six years. Travel abroad, working as an assistant, and competing for the Royal Institute prizes filled up our time till, some eight or nine years after the first days of pupillage, we began to practise.

And now, having spoken of those subjects which I wished first of all to mention to you, I pass on to speak more particularly of the School of Architecture and the objects of our education. When I was thinking of my address to you to-night it occurred to me that I could not do better than begin it by quoting the following words, written by our great King Alfred more than a thousand years ago. These words are: "Thou knowest that no man may understand any craft, or wield any power, unless he have tools and materials. Every craft has its proper tools." It is true the King was writing about kingly power and describing the tools and materials necessary to make that power of a fit and noble kind. Still, the quotation, so clear and to the point, as was the way of the great ruler and law-giver, sufficiently describes the aim of this Association, which is to give its members power to do good work by the provision of a thorough system of education. At the risk of being a little tedious and repeating to-night what a good many here already know very well, I wish in this address, which I have the honour as your President for this year to make you this evening, to refer to the work of the Association and to the influences which now affect it, and to those further influences which might be brought to bear upon it. Although the risk I have mentioned is present, I am the more emboldened to speak on this theme because we have amongst us several new members, who are fresh to the conditions of life in our Association and unacquainted with some of the movements influencing the current of art life in this country.

Now, the most important work of the Association is the School of Architecture. The successor of the old voluntary system of education for which the Association was primarily founded. The present method of education consists, as you all know, of a four years' course, divided into two years in the Day School and two years in the Evening School, during which latter period the student is articled to an architect in practice. By this means the careful preliminary training in the first two years in this school leads up to the combined office and school training in the succeeding two years, a combination obviously of the utmost value to the student. This course of instruction is an admirable one so far as it goes; the details and effect of its working are always being most carefully watched by the head master and educational staff, and by the Council of the Association, who frequently meet to confer together. A new development has been inaugurated this year. Professor Beresford Pite, himself an old member and Past-President, well acquainted with the history and work of the Association, has joined the educational staff as Director of Education in the schools. As a master in the Evening School and as lecturer in both the Day and Evening Schools, he will instruct as well as direct. This is an accession of strength to our system which Mr. Maule and the assistant masters have heartily welcomed, and I think we are entitled to congratulate ourselves upon it, and to hope for a continued healthy growth of our means of education. In addition to the four years' course to which I have referred, I may here announce that it is intended to form at once an advanced class, or a fifth year's course, for those who are desirous—and I believe there are many such—of pushing their studies further.

Period of Study.

Hitherto the four years' course has been founded upon the syllabus put forth by the Board of Architectural Education, and a tradition of sound and careful work has been established in the schools, which is constantly growing and expanding to meet the needs of the day. I am aware that there are those who hold that a four years' course is sufficient for an architectural student before beginning to practise, and particularly for the man who has been to a university. Though I am strongly of opinion that four years is not enough for the greater number of students, I admit there is a good deal to be said for this period of study in the case of those who have spent three or four years at the University and who have done well there. Time is of consequence in their case, and the trained minds of students who have been through the University course will learn and absorb more quickly than the minds of those

who enter the schools here direct from the public schools. For these last I assume, and I believe rightly, that the four years' course is too short a term of instruction, and I believe that the student who makes up his mind to spend the years between eighteen and twenty-eight in the close study of his art, earning his living, if necessary, meanwhile, and others have done before him, as an assistant to architects in practice before practising as an independent architect, is more likely to become an accomplished artist than he who begins to practise immediately on the conclusion of his articles. It seems to me that if it were possible to combine the general education of a University with the acquirements of the preliminaries of architectural knowledge for perhaps two years after the student has left his public school, it might be very valuable.

These are matters which I hope may come before the Board of Architectural Education for consideration, for I believe it will become necessary for the advantage of our students generally to bring about a co-ordination of the present opportunities for the advanced student who has completed the four years' course and who does not wish to immediately set up in practice. At present these opportunities of study are very varied, and, I will add, very interesting. To name only a few, there are our own new five years' course, and all our students should, if possible, go through the fifth year's course—and the prizes offered by the Royal Academy of Arts and the Royal Institute of British Architects. To obtain one of these prizes confers deserved honour upon him who gains it, and gives him credentials which help him to gain a good position for himself in some form or another, and which makes for him a real start in his artistic life. Besides this, these prizes give to the student the great opportunity of developing his knowledge by travelling for purposes of study. There exists, however, the difficulty that, while the competition for the prizes of the Royal Institute of British Architects is open to all *bona fide* architectural students; in the case of the Royal Academy the competitor must have passed through the full terms of studentship. As an old student of the Royal Academy, and one who has a great respect for its system of training, I can understand that its prizes are intended for its own students. But as one anxious to see a higher development of our general educational system, I feel it would greatly assist the student of to-day if he might enter the advanced classes of the Royal Academy, upon satisfying examiners as to his ability, without being obliged to go through the whole course. For instance, it would be an advantage for our students who have obtained their certificates here after several years' study to enter the Royal Academy Schools to compete for the Gold Medal and Travelling Studentship, and to reap the advantages of meeting with student-who are studying the sister arts of painting and sculpture. A goodly number of our students are debarred at the present time from doing this through having to go through a probationary period on entrance, equivalent to the earlier years of the course completed by them here.

Foreign Studies.

The training which a student must undergo who intends to compete for one of these prizes is of great importance to him, while the fact that nearly all of them, such as the Royal Academy Gold Medal and Travelling Studentship, the Soane Medallion, the Tite Prize, the Pugin, the Owen Jones, and others of the Royal Institute of British Architects, carry with them an obligation upon the successful competitor to travel either in England or abroad for purposes of study constitutes their great educational value. In my opinion, the education of the advanced student is not complete until he has studied abroad. He may do this by independent travel, or he may join for a time the British School at Athens or the great French School—all admirable courses to pursue, and well worthy of your attention and consideration. Further, in connexion with this important part of a student's career I would like to mention the probable foundation of a large British school for advanced students in Rome. This possibility inspires the hope of an extension of the opportunities for advanced study of a particularly interesting kind. The

development of this scheme may necessitate some future time such a co-ordination of the means of study to which I have alluded might lead to the formation of a great national School of Fine Art and the crafts building in this country, of which our schools would form a recognised part.

The formation of such an advanced school does not presuppose any slavish imitation of the French School, though I believe we may learn much from that school. For instance, we must not forget that the well organised years of study of the best French students—those, for example, who have won the Prix de Rome and have spent the four years which is the custom on winning that prize) in the study of old work in Italy and Greece—have contributed to the great achievements of French architects during the last 200 years. It was, at any rate, this very thorough system of training which helped Labrousse to build his library at Geneviève in Paris and his notable additions to the Bibliothèque Nationale; which helped Duban in his building at the *eaux-arts*, and Duc at the Palais de Justice. We must recollect that the foremost students of the past have all been men who have inspired their fellows to put forth their best powers. We have here in England artistic forces which, if combined, would, I believe, prevent such waste of energy and power, and would lead to the production of finer work of a more national character. The chief principle which, in my view, leads to success is that if you are going to be a distinguished artist you must first of all be a distinguished student. No system of education is of use which does not bring out and form the qualities which make up what we know as character. As the man is so will his work; it is essential, therefore, for a student to have access to the best models and to be brought into contact with the best and highest thought, both ancient and modern. In this way will his own character be formed by the true artistic influence which flows from great men and great work. Carlyle says in all true works of art the Godlike is rendered visible. If so, the artist must be creative, and our aim should be to make our students receptive, imaginative, and fruitful in ideas and design, so that they may become creators and beauty. Our motto is "Design with beauty, build in truth." We might well add Shakespeare's words—"By knowledge are we lifted up to the gates of Heaven." For our students I would say, let the motto of our Association become your own motto, and with it in your hearts take full advantage of the education offered to you here in both schools, remembering that the Evening School is the complement of the Day school. Make it an aim to keep yourselves ever open to the artistic influence by sincere and fruitful study. Robert Louis Stevenson in one of his delightful essays says that the best artist is not the man who keeps his eyes fixed on posterity, but the one who loves the practice of his art. And no art can give its author more intense pleasure than the mistress to which you are devoted. Beauty in architecture has many manifestations; you may have it in the exquisitely delicate and refined detail or in that which is splendidly bold, in the stately and dignified plan and elevation, in the fine lines of the column, or in the sense of superb scale. We have in England to struggle against the small and petty detail which disfigures building after building to-day. We need to absorb into our minds the principles of broad and fine work. Think, for instance, of the fine capital of a classical column of Francis I.'s time; the sweep of the line of the horns or volutes as vigorous as the clean line of a rapier, the flat relief of the intermediate carving as delicate as the arabesque pattern on its blade.

I have lately been reading some of Sir Joshua Reynolds's "Discourses"—a work I would commend to your notice—and I was struck with the earnestness with which he impressed upon the students of the day the necessity of possessing themselves with the spirit of the great masters; and also with the manner in which he cheered them with encouragement to be determined to succeed when he roundly states "he should have felt the same determination to become the most eminent physician as he then felt to be the first painter of his age and country." Such a statement in its simplicity reminds me of the remark, attributed, I believe, to

Mr. Edison, "that success in life is due to 1 per cent. of inspiration and 99 per cent. of perspiration." It was Sir Joshua Reynolds who, as I daresay some of you will remember, went as a distinguished young painter of thirty years of age to Italy to see for the first time the work of the great masters of the Renaissance. So impressed was he that he has written he felt he must become again as a little child, he had so much to learn. In this wonderful humbleness of heart Sir Joshua reminds me of Sir Christopher Wren, who showed the same willingness to learn as is illustrated in that most interesting letter, which you probably know, which he sent from Paris, where he had gone for the purpose of study. Surely these two men were much alike in character, with the same wide and sane way of looking at things and the same thirst for knowledge. That "spirit of the old masters" which they possessed made them strive for a right kind of perfection in their work. It made them reject what was small and petty and adopt the manly and virile. It made them discern and eliminate their defects, for, as Sir Joshua said to his students, "it was not by their defects that considerable artists acquired their reputation; they have a right to our pardon, but not to our admiration." He also taught that a student must not by mistaken industry lose his time in that which is merely ornamental. And in speaking of copying the old masters he says—"Instead of copying the touches of those great masters, copy only their conceptions. Instead of treading in their footsteps, endeavour only to keep the same road. Labour to invent on their great principles and way of thinking. Possess yourself with their spirit. Consider with yourself how a Michelangelo or a Raphael would have treated this subject, and work yourself into the belief that your picture is to be seen and criticised by them when completed. Even an attempt of this kind will rouse your powers." He knew of his art, as we know of ours, that it is a progressive art; it is ever growing, and to-day, when science advances with strides, when space is being conquered, and distant lands may soon be easy of access, who among us can prophesy the future of the young architects? It shines in the distance as something mysteriously and gloriously interesting. And that future is not for these men only who carry off the most prizes. We cannot all be "Prix de Rome" men. It is for all who do good work, and again I quote from Robert Louis Stevenson:—"All who have meant good work with their whole hearts have done good work." No man, even the greatest, ever arrives at the ultimate goal; he does his part, and passes on his experience to the next in the race, and very soon that responsibility will be yours. The future is for you, as, again, it will be for the young men who come after you.

The Future.

In the meantime you have to prepare for that future, remembering that according to the truth and sincerity, the high ideal, that you put into your work so will your influence upon the public be, and with you rests the education of the public. In order to emphasise this I am again going to quote to you from Sir Joshua Reynolds's "Discourses," and I do not apologise for this, because, as I have told you, great men are our best teachers. In speaking to his audience on the subject of raising the public ideal, he reminds them of a remark of Euripides, who said to the Athenians, "I do not compose my words in order to be corrected by you, but to instruct you." And he adds—"It is true to have a right to speak thus a man must be an Euripides. However, this much may be allowed, that when an artist is sure that he is upon firm ground, supported by the authority and practice of his predecessors of the greatest reputation, he may then assume the boldness and intrepidity of genius; at any rate, he must not be tempted out of the right path by any allurement of popularity which always accompanies the lower styles of painting." I think we may say that this is equally true of architecture. Great men, who are the truly thoughtful men, always sound again and again the note of character. They know that a nation's place depends upon its national character, and the men and women of the day are the nation. In a sense we are all artists; but to you young men, who are

not only artists in this general sense, but belong to one of the noblest—perhaps the noblest—of the artistic professions, I would quote as a motto, and in conclusion of my address, King Alfred's words:—"This will I say—that I have sought to live worthily while I lived, and after my life to leave to the men that come after me a remembering of me in good works."

Mr. A. Keen,

in proposing a vote of thanks to the President, said he had known Mr. Horsley from the day he first entered on his architectural career, and he congratulated him on the undoubtably important position he had reached and on being chosen as President of the Association. Mr. Horsley had given them a thoughtful address, which he would rather think about than talk about. There was plenty of material in the address for reflection, but it was not an address about which it was easy to speak at short notice. Mr. Horsley had given them two quotations from King Alfred, both of which were peculiarly appropriate to them. The second quotation—"that I have sought to live worthily while I lived, and after my life to leave to the men that come after me a remembering of me in good works"—was particularly applicable to the work of architecture, because the architect's work was so alluring; and if it was good it exerted a good influence on people for a long time, whilst if it was bad it exerted a bad influence, which also lasted for a long time. The other quotation, which dealt with tools and material, was also appropriate to them in that Association, because he claimed that the tools they used and the materials they put at the disposal of the students were the very best. At all events, they did not know how to make them better. Mr. Horsley had also referred to the advice given by Sir Joshua Reynolds, that a student must not by mistaken industry lose his time in that which is merely ornamental. He had always considered that the syllabus which the Board of Architectural Education had issued for the guidance of architectural schools was a remarkable document, and expressed in an able way the principle that all sound architectural design must proceed from building (using the word in its broadest possible sense)—that it must be an expression of the uses of the building. Mr. Horsley had had a great deal to say about architectural education in their school and in other places, but he always felt that there was a danger connected with the teaching of architecture in the school, in that it might tend to become too much a matter of pencil and paper, without sufficient reference to actual construction and material things. Those, however, who had had the direction of that school had always striven to direct the students in the opposite direction, and he always covered himself with the thought that in England, at any rate, they had had the Gothic revival, and the influence of that revival was, of course, in the direction of teaching that architectural design was an expression of the uses of a building. He did not think at first sight that anyone quite realised how great an influence the Gothic influence was and how strong it would continue to be for a long time, and how powerful a corrective it would be to the tendencies of what they might call the academic method of architectural teaching and training. They had heard of the hopes and aspirations of the founders of the Architectural Association sixty-four years ago, and, of course, these founders never for a moment realised how far the work which they commenced would go and how great an effect it would have in the three generations which had elapsed since they put their hands to the work. Nor did he think they at the present time could have any idea of how much farther it was likely to go before it stopped, if it ever did stop. There could be no doubt that they had arrived at a stage when there was going to be another shaking together of the dry bones, and it remained to be seen what kind of body arose from it. There were all sorts of useful schools carrying on work on different lines, but until they were co-ordinated to some extent they could not get the best possible results from them. Mr. Horsley had suggested that the Royal Academy should be brought in in some active way, and he himself had always felt that the

Academy had at its disposal such assets, which no other school in the country had, that if the Royal Academy could see its way to work in line with the other schools of architecture, and ultimately with the School at Rome, which, he understood, was to be much extended and developed, then the results could not fail to be of the best possible kind. Whether that would come about or not it was impossible to predict, and it seemed to him that the Academy must surely realise before long that its right place was at the head of all the other architectural schools, and that students from these schools ought to be sent there, and, if possible, to Rome afterwards. He did not himself know what the school at Rome was to consist of—whether it was to be merely a school of archaeology and architecture, or whether sculptors and painters were to be associated. If, however, something of the latter kind were done, then they might have a British school at Rome which they would have reason to feel exceedingly proud of. He believed there would be an opportunity before long to send out students in considerable numbers, and if the school was of such a character as he hoped, then the students would be in a very enviable position.

Mr. Curtis Green,

who seconded the motion, said that in 1892, the year when he began his architectural pilgrimage, a book was published entitled "Architecture: A Profession or an Art." The master he was then with presented him with a copy, and attached to it was a little challenge that he should answer the question in his own person. It consisted of a series of essays edited by Mr. Shaw and Mr. Jackson and written by such eminent men as the late Mr. Bodley, Professors Lethaby and Blomfield, Mr. Newton, and Mr. Prior; and one of the most inspiring essays, on "Unity in Art," was by Mr. Horsley, their President. He read the essay again last night, and it

was a delightful study, as fresh, and unfortunately in some respects as true, to-day as the day when it was written. Mr. Horsley became a name to him—a name standing up amongst those who counted. Twelve years ago he was so fortunate as to become a neighbour of Mr. Horsley, and found that he was as good as his written word, and that he admitted unknown and untried young men to the circle of his acquaintance and good-fellowship. Mr. Horsley probably influenced for good his slow and painful architectural development. They had all had some experience of their new President during the years that he had worked for the Association. Those of them who were so fortunate as to go on the excursion this year knew something of his qualities of leadership. He was sure that he might speak for the present Council by saying that they desired nothing better than to serve their art by following his lead and by doing what they could to make his year of office worthy of him and of the best traditions of the Architectural Association. They had listened that night to his Presidential address, the scholarship and wise discretion of which had inspired them greatly. Only those, like Mr. Keen, who had had this honour thrust upon them could speak adequately of the time, the labour, and the self-sacrifice demanded of the President for the time being in carrying on the work of the Association. That Association stood for unity in art, and they were the spiritual offspring of the masters of architecture and of the founders of the Association, and those of them who might read their President's address would feel that the Association was living up to its great reputation of service.

Mr. Paul Waterhouse

said the President had spoken on a subject which was most interesting to them—themselves. He did not mean to say that they were all students in the sense of being

between the years of eighteen and twenty-eight, and, indeed, last week he found himself in the venerable position of being the parent of a student. But he would like to say that no man who was an architect or hoped to be useful as an architect could ever abandon himself to the feeling that he had become aged or even middle-aged. Architectural work necessitated in the production that spirit of eternal youth which made a man spring to a new job with the same delight that a student started off to win the Soane Prize, for example. Their President had trodden on very dangerous ground by suggesting a comparison between the architectural education of his day and that of the present. They knew there were architects of all kinds. There were architects who were successful without being good draughtsmen, and excellent draughtsmen who were not successful architects. Now and then they came across men who were a brilliant combination of both. Mr. Horsley was one of them, and he had also discovered that when an architect reached a position of eminence he was expected to be a public speaker as well. That night their President had shown all possible doubt that he combined the three great qualities of the modern architect, and therefore when he asked them to compare the methods of to-day with those of the past he must remember that many of them would be apt to say, "Give us the good old days if they produced such men as we have sitting there."

The resolution having been carried,

The President

briefly replied, and remarked that he realised he had a difficult task in following Mr. Keen. It was his firm intention, however, to do all he possibly could during his year of office to further the best interests of the Association.

ARCHITECTURAL SOCIETIES.

Architectural Craftsmen's Society: The Glasgow Technical College.

In the course of his presidential address to the Glasgow Technical College Architectural Craftsmen's Society on Friday evening Mr. James S. Boyd, Licentiate R.I.B.A., dealt with the application of practical geometry to (a) the solution of problems in stonecutting, and (b) to the full-size drawing down and mould cutting in masonry work.

Referring to the training of young masons who desire to become qualified foremen, he said that such should possess considerable skill in the application of practical geometry to the varied and complicated masonry problems which at times occur. Otherwise he would have difficulty in making the necessary scale drawing from which he obtains the shapes and dimensions of the blocks for ordering, and he would have even greater difficulty in drawing down the work full size on the drawing floor. Mr. Boyd described by demonstrations how to set out arches of various forms on the drawing floor, and how the moulds and bevels are developed in work of double curvature, skew bridges, interpenetrations of vaults, domes, and other more or less complex masonry constructions. Referring to the cutting of zinc moulds, he condemned the general custom of giving that work to the joiner instead of the mason, on whom rests the responsibility of producing correct work. In concluding the address, he recommended the younger masons to uphold the dignity of their crafts by making themselves thoroughly efficient, not merely as hewers of stone, but as scientific craftsmen worthy of the position of foremen.

BOOKS.

An Analysis of the Church of St. Mary, Cholsey, in the County of Berkshire. By F. J. COLE, D.Sc.Oxon., Professor of Zoology, University College, Reading. With twenty-three plates. (Oxford: B. H. Blackwell, Broad-street. London: Henry Frowde, Amen-corner. Reading: G. A. Poynder. 5s. net.)

This little work "is issued in accordance with a scheme for the publication of studies dealing with particular aspects of local history," the object of the enterprise being

South Side of Chancel.

(From Professor Cole's "Analysis of the Church of St. Mary, Cholsey.")

be very laudable one of stimulating public interest in the history of Reading and the neighbouring counties, and "to afford a means by which the general historical teaching of the University College [Reading] may gradually become connected with, and be illustrated by, the detailed evidence which is furnished by local history." The work is not lengthy, consisting—apart from some twenty excellent full-page photographic illustrations of the church—of but sixty pages of descriptive matter; but it forms a singularly able and exhaustive monograph on an interesting building, and bears evidence of much careful investigation and inquiry by the author. The style is not inapt, for an analysis the work is a very easy, and the University of Reading may be congratulated not only upon this theme for the production of these studies in local histories—of which three, including the volume under notice, appear to have been issued—but upon the very able work Dr. Cole has prepared in his analysis of the church. Holy Church must be familiar to most architectural students, but we may with advantage, in noticing the volume, quote the opinion of the author, who says:—"The late interest of our church, apart from an engaging variety of minor problems, lies in its ground plan, and in the beautiful design of its east end. . . . I not only fail to find any evidence of Saxon work in the church at Cholsey, but on the contrary there are many grounds for holding that the oldest portions of the existing church are not antecedent to the twelfth century." The work includes a detailed note on the mouldings, with careful drawings, and some excellent photographic illustrations of the building.

ERRATUM.

In our notice of "The Corrosion of Iron and Steel" (p. 216, issue of August 25) the author's name is given incorrectly; it should be J. Newton Friend.

BOOKS RECEIVED.

STRUCTURAL ENGINEERING. By Joseph Stubsand and William Harby. (London: Longmans, Green, & Co. 7s. 6d. net.)

GENERAL NEWS.

Professional Announcements.

Mr. Robert Marchant, A.R.I.B.A., has removed from 28, Theobald's-road, to 2, Bedford square, W.C.
Mr. Francis Osler, A.R.I.B.A., has removed from 5, Verulam-buildings, Gray's Inn, to 9, Gray's Inn-square.

The Grafton Gallery Exhibition.

The Exhibition opened at the Grafton Gallery on Tuesday by the Duke of Connaught is entirely pictorial. It has been arranged in aid of the National Art Collections Fund, whose aims are so worthy of support. Two works by Guardi have architectural interest, as have several drawings from Mr. Heseltine's collection and others, among them sketches by Robert Adam, Paul Sandby, and Thomas Girtin, lent by members of the newly-formed Walpole Society. Lord Curzon in his introductory speech made some good suggestions regarding State aid to art. In these days, he said, it was not possible for the National Gallery with its limited resources to resist the Transatlantic and Continental competition, and he urged that the Government grant of 5,000*l.* a year to the National Gallery should be increased to 25,000*l.* Sir Edgar Vincent, putting the obligation at 50,000*l.* per annum, thought that a liberal policy by the State in art matters was the best possible finance.

The Road Board: Grants to Highway Authorities.

During the months of July, August, and September, 1911, the Road Board, with the approval of the Treasury, have made advances amounting to 131,764*l.* from the Road Improvement Fund to County Councils and other highway authorities as follows:—For the improvement of road crusts (including grants towards tar macadam, etc., and surface tarring), 111,555*l.*; for road widenings and improvement of curves and corners, 9,120*l.*; for road diversions, 7,308*l.*; for construction and improvement of bridges, 3,781*l.* The total grants up to September 30 (including those contained in the lists published on February 11, April 29, and July 29 last) amounted to 407,154*l.*, as follows:—For the improvement of road crusts, 321,445*l.*; for road widenings and improvement of curves and corners, 44,856*l.*; for road diversions, 16,906*l.*; for construction and improvement of bridges, 23,947*l.* In addition, the sum of 8,173*l.* has been advanced by way of loan. The work of putting down trial lengths of twenty-three different kinds of road material on a section of the London-Folkestone Road between New Eltham and Sidcup has now been completed. Five trial lengths have also been put down on the Portsmouth Road in the Borough of Wandsworth, between Wimbledon Common and Robin Hood's Gate.

Sale of Properties.

The estates that have just been placed in the market comprise Woodcote Park, near Epsom, about 350 acres, of which the mansion has a facade ascribed to Inigo Jones, with painted ceilings by Verrio, and carving by Grinling Gibbons or his school. Burford Priory, Oxfordshire, represents the St. John's Priory, which appertained to the wealthy abbey of Black Canons, at Eynsham, dedicated to the Virgin and SS. Peter and Paul, and founded by William, Duke of Gloucester, in or about 1170; the mansion, built by Edward Harman soon after the Suppression, was

bought by Sir Lawrence Tanfield, who bequeathed it, with the manor, to his grandson, Lucius Carey, Viscount Falkland, who fell at Newbury, and had previously sold the estate to Speaker Lenthall; Lenthall enlarged the house and built the chapel; Colonel B. de Sales La Terriere has latterly improved and renovated the property. Burford Priory is depicted in Waller's painting, "The Empty Saddle"; on the estate are Kitt's Quarries, which supplied some stone for the interior of Westminster Abbey and St. Paul's. Redlynch, near Bruton, Somerset, a seat of Lord Ilchester, extends to 4,500 acres, and the house was built in 1672 for Sir Stephen Fox, ancestor of the present possessor. No. 139, Piccadilly, the home of Lord Byron after his marriage, and of the Duke of Queensberry, and latterly of the late Lord Glenesk, for whom the stone facade was built after designs by R. S. Wornum; the lease, of which sixteen years are unexpired, is held from the Woods and Forests at a ground rent of 812*l.* 10s.

No. 119, Piccadilly.

These premises, lately vacated by the Royal Automobile Club, have been taken over and redecored for purposes of the newly-established Cavendish Club. The house, which is situated upon the Sutton estate, was converted for the former Club a few years ago, and some structural alterations were since made for them by Mr. E. Keynes Purchase.

Changes in Haymarket.

Messrs. Garrard & Co., Ltd., have just removed from their old house at the corner of Panton-street to new premises in Albemarle and Grafton streets. The house was originally opened by the sign of the "King's Arms" by George Wikes in 1721; to him succeeded William Garrard, his assistant; in 1791 the business passed to Robert Garrard and his sons, as Crown jewellers and goldsmiths. Nos. 18-21, at the corner (north) of Orange, formerly James, street, with Nos. 1, 3, and

South Door of Nave—West Jamb.

(From Professor Cole's "Analysis of the Church of St. Mary, Cholsey.")

5, Orange street, are to be rebuilt by Mr. W. Cave for Messrs. Burberry, Ltd. Messrs. Garrard's new premises have been built from designs by Messrs. Ernest George & Yeates.

Carpenters' Company Lectures: University College.

As may be seen in the list of Meetings (p. 391), Mr. E. S. Prior, F.R.I.B.A., begins next week his course of lectures at University College on "English Mediaeval Architecture." The subject is attractive and there should be a good attendance. Free admission tickets may be obtained from the Secretary to University College, or from the Clerk to the Carpenters' Company.

Newcastle Municipal Buildings.

The site considered by the Committee to be the most suitable for the New Town Hall is that of the present Northumberland Baths in the Northumberland-road. The question of cost is before a Sub-Committee.

The French Renaissance.

Messrs. Bell will publish next week the history of Renaissance French architecture, on which Mr. Reginald Blomfield, A.R.A., has been engaged for many years. It will be a companion to the same author's well-known work on English Renaissance. The book will be issued in two volumes, and will be profusely illustrated from drawings by the author, scarce engravings, and other sources.

COMPETITION NEWS.

Langside District Library, Glasgow.

For this, the last of the district libraries, a site has now been fixed. The City Council on the 27th ult. approved of the recommendation of the Finance Committee to accept an offer of ground at No. 4, Sinclair-drive, containing about 1,500 sq. yds., for the sum of 1,000*l.* A special Sub-Committee, after an inspection of the ground, considered that it was admirably adapted for the purpose. As Mr. Carnegie had gifted to the Corporation a further sum of 15,000*l.* required for the erection of the two remaining libraries for the districts of Possilpark and Langside on condition that the cost of sites should not be

made chargeable to the rates, it was agreed that a grant to given from the Common Good for the purchase of this site for the Langside Library.

As in the case of the other Glasgow libraries, an open competition will be promoted for the selection of a suitable design.

The successful plan for the Possilpark Library, which was the last competition promoted, was published in the *Builder* for March 31 last, and shows the type of plan favoured.

An Extraordinary Suggestion.

We call the following from the advertisement columns of the *Glasgow Herald*:—

"The Town Council of Armadale invite architects to submit plans for a public hall and offices, costing not more than 2,500*l.*, completed, painted and furnished. A premium of 15*l.* for the selected design will be paid on its being ascertained that the design can be carried out within the cost stated, and 10*l.* will be paid for the next. The architect submitting the successful design will be entrusted with the work at the usual professional remuneration. Architects intending to submit plans will meet the Town Council on the ground at Armadale on Thursday, October 12, at 1.30*l.*"

It seems to suggest that, while public bodies are fully alive to the advantages to be gained by competitions, they have still much to learn regarding the conduct of the same. With entries as numerous as we have had in some recent competitions, we fear the travelling facilities to Armadale will prove inadequate on the 12th inst.

CONSERVATORY LOUNGE AT THE BALHAM CONSTITUTIONAL CLUB.

This little building is an addition to the club premises, and forms a lounge connecting concert-hall, reading and billiard rooms.

It is built of thin hand-made red bricks with a wide joint, and is surmounted with an entablature of concrete finished with cement and coloured.

The roof is of glass and lead.

The window frames and casements are of deal as well as the doors, and all painted a cream tone.

The interior is finished in plaster, with a simple treatment of plasters and panels distemper white, and the floor is covered with dark red quarries.

The architects are Messrs. William & Edward Hunt.

INTERCOMMUNICATION COLUMN.

External Woodwork.

Will a reader say what is the best way to treat the outside woodwork of a house of wood and brick? It is like an old Chester house, similar to those situated in the Rows, and is probably of the Queen Anne or Elizabethan period. The outside woodwork has always been oiled and then varnished. Would it be preferable to paint it, or to continue oiling it? If oiling, how many coats of oil are necessary, and should a finish be given with a coating of varnish? What kind of oil is the best to use and what kind of varnish? Is there any book on this subject?

Barmouth, Wales.

A. H. M.

Terrazzo Flooring.

How is terrazzo flooring laid? Full particulars will oblige. EDWIN F. SCAMELL, Salisbury.

[*.* The following specification is given by a well-known firm, whose name will be sent if desired:—A layer of $\frac{1}{4}$ in. of sand and cement, two and a half to one, to be laid on floated surface provided by the builder. On top of this layer about $\frac{1}{2}$ in. thick of compost of marble chips $\frac{1}{4}$ in. to 5-16 in. mesh, and cement gauged two to one is to be laid. The surface of this is then to be thickly sown with marble chips average $\frac{1}{4}$ in. to $\frac{3}{4}$ in. mesh, and the whole floor to be then rolled to imbed the larger pieces in the smaller, and trowelled to a true surface. When sufficiently set the floor is to be rubbed down with stone to remove the surface cement and smooth the face. It is to be afterwards sprinkled with dry cement and rubbed down a second time to fill up any pinholes and to give the required grit polish.—Ed.]

Addition to Balham Constitutional Club. (See also page 379.)

Messrs. William & Edward Hunt Architects.

EDITORIAL SUMMARY.

"The Purpose of the Architectural Competition" is the subject of our leading article. The future of the Architectural Association is considered in the second leader (p. 380).

"Notes" (p. 381) are: "Cheap Churches"; "The Architect's Garden"; "The Survey of London"; "The L.G.B. and Civic Amusements"; "The Empire Palace Fire"; "Oriel College, Oxford"; "The Disaster at Austin, Pennsylvania"; "Railway Nationalisation."

The eighth section of Mr. Shaw Sparrow's article on "The Story of the Bridge" begins on p. 382. The point discussed is the position of architects in such enterprises.

A report of Mr. G. C. Horsley's Presidential Address to the Architectural Association is given on p. 385.

Professor Cole's "Analysis of the Church of St. Mary, Chelsey," is reviewed on p. 388.

The Monthly Review of Construction (p. 393) opens with an article on "Timber in Roof Coverings." Other articles (p. 395) are on "The Colouring of Wood" and "A Reinforced Concrete Flooring."

An article on "The Appointment of an Arbitrator" heads the Building Trade Section (p. 398), and a note follows on "Extraordinary Traffic."

The Master Painters' Convention at Derby is referred to on p. 398.

Illustrations are given on p. 401 of the drawings by Mr. G. Wyville Home which obtained the Silver Medal of the Architectural Association.

MEETINGS.

FRIDAY, OCTOBER 6.

Birmingham University.—Mr. Raymond Unwin's inaugural lecture on "Civic Design," in the Mason College Building. 5.30 p.m.

SATURDAY, OCTOBER 7.

Institution of Municipal Engineers (Yorkshire and Northern Districts). Meet at N.E.R. station, Leeds, 10.55 a.m. Visit to Messrs. Thomas Green & Sons, Ltd., Smithfield Ironworks, to the Headingley Electric (Water) Pumping Station, and to the new Filter Beds.

MONDAY, OCTOBER 9.

Incorporated Clerks of Works' Association (Carpenter's Hall, London-wall).—Monthly meeting. 8 p.m.

MONDAY, OCTOBER 2, TO TUESDAY, OCTOBER 10.

Royal Institute of British Architects.—The Ninth International Congress of Architects, Rome.

THURSDAY, OCTOBER 12.

University College.—First of eight public lectures by Mr. Edward S. Prior, F.S.A., F.R.I.B.A., on "English Medieval Architecture." 6 p.m.

Sheffield Society of Architects.—President's Address and Exhibition of Students' Work.

FRIDAY, OCTOBER 13.

London Salon of Photography (Sa, Pall-mall). Mr. Arthur Marshall, A.R.I.B.A., on "With a Camera in Holland." 8 p.m.

Gloucester Architectural Craftsmen's Society.—Mr. J. S. Glen-Primrose on "The Microscopical Examination of Architectural Materials."

ILLUSTRATIONS.

No. 10, Carlton House-terrace.

MESSRS. DETMAR BLOW & FERNAND BILLEREY are the architects of this building, carried out for Viscount Ridley. The work, started in 1906 and completed the following year, consisted in remodelling the interior structure and decorating that part of Nash's building on the east side of the Duke of York's steps. Though the main walls and general

distribution of the first floor were retained, the former inside arrangement of areas, service stairs, lift wells, etc., was swept away, and the old staircase was pulled down in order to build a new staircase of architectural proportions and to simplify the planning of the drawing-rooms. Viscount and Viscountess Ridley, who directed the work with the greatest interest, insisted on great simplicity in design and great care in the elaboration of the detail.

The walls of the entrance-hall and those of the principal and secondary stairs were faced with Caen and Painswick stone, whilst the steps themselves, 7 ft. 6 in. long, were built in solid black marble; the ceilings and vaultings were formed in stucco, jointed to match the stone.

The wrought-iron and bronze railing was executed by Mr. W. Bainbridge Reynolds, the bronze ornaments being specially modelled under the architects' directions by M. E. Madeline.

The drawing-rooms were panelled, the mouldings and ornaments being gilt and "patined," in order to give them the appearance of old work. The ceilings of the two end drawing-rooms were enriched with modelled plaster decorations, while that of the gallery was covered with a painted canvas by MM. Bremont & Tarkmain.

The work of building and decorating was carried out by Messrs. Trollope.

The Story of the Bridge.

THE illustrations of the bridges at Avignon and Toledo are in connexion with Mr. Shaw Sparrow's eighth article (p. 382).

Burlington Arcade.

THE additional story to the Piccadilly frontage of the Burlington Arcade, shown on the accompanying plate, has been recently erected. It

Ballroom: No. 10, Carlton House-terrace.

Messrs. Detmar J. Blow, F.R.I.B.A., & F. Billerey, Architects.

First Floor Plan.

Town Residence for Viscount Ridley: Ground Floor Plan.

Messrs. Detmar J. Blow, F.R.I.B.A., & F. Billerey, Architects.

is surmounted by the arms of Lord Chesham, which are executed in terra-cotta made by Messrs. Stiff, of Lambeth. Mr. Maddison, of Canning Town, was the contractor, and Professor Beresford Pite, F.R.I.B.A., the architect.

The original fine yellow brick facings of the upper portions of the internal elevations of the Arcade have been cleansed from the paint-work of nearly seventy years and restored.

Nos. 55 and 56, Threadneedle-street.

This building has been erected for Messrs. W. B. Blydenstein & Co., who, previous to the rebuilding, occupied No. 56. They occupy the ground, first, and basement floors: the other floors are in various occupations, and are approached from a staircase in Hercules-passage.

The floors used by Messrs. Blydenstein & Co. have been fitted up to suit their requirements. The walls are covered in marble and faience, and all fittings are in hard wood, mahogany being used for the offices, and fumed oak in the partners' rooms.

The front of the building is in Portland stone, with metal casements to the windows, and has been designed so as to give as much light as possible to the office floors.

The architect for the building is Mr. Chatfield Clarke, F.R.I.B.A., and the builders are Messrs. Hall, Beddall, & Co.

FIFTY YEARS AGO.

From the *Builder* of October 5, 1861.

The National Exhibition in Florence.

A MEMORABLE day was September 15 for Florence—the joyous excitement shared by all classes, the richly varied decoration of streets, the display on every side of national colours and symbols, and the enthusiastic reception given by this people to their King, altogether combining in what seemed the highest expression of that new life to which liberated Italy has awakened; and at the same time asserting for her—the “Etrurian Athens”—that brilliant position vindicated by her past and present; that title which whatever by future contingencies, must continue to command regards and honours for her as, by indefeasible right, the intellectual if not the political capital of united Italy. As for the scene in the palace of the National Exhibition that morning, it was rather a court ceremonial than anything

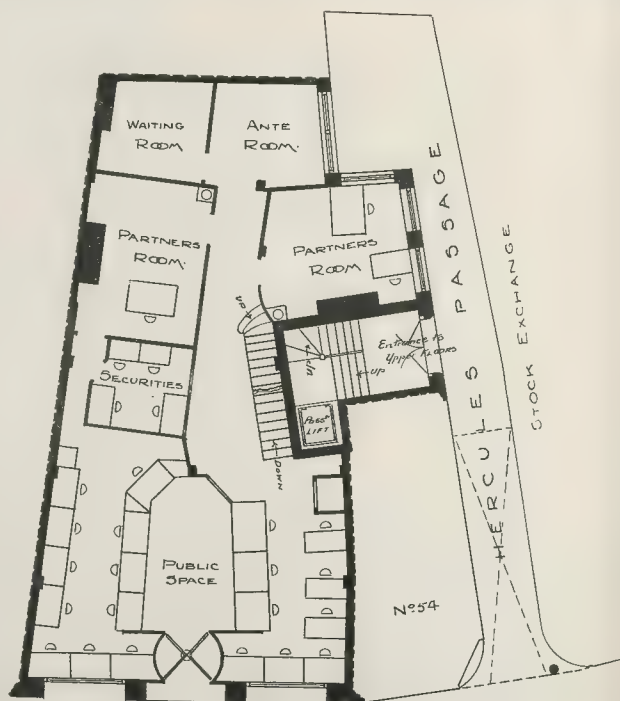

else, though, indeed, most beautiful to behold and attended with demonstrations most fervent.

The story of Italian exhibitions, industrial and artistic, may be said to have its centre

in the Tuscan examples. Under the boldly-innovating government of Peter Leopold was ordered the first public exhibition of fine arts this country had yet beheld, in 1791. French invaders next set the examples, to be followed with more systematic procedure in the present century; and under their auspices took place at Turin, 1805, '11, '12, the first series of general exhibitions for all local produce, artistic, industrial, agrarian. After the legitimate restorations were founded in the same kingdom, under Charles Felix, triennial industrial exhibitions, the first of which took place in the beautiful suburban palace of Valentino, near Turin, in 1829, the number of exhibitors being 502; and with what success this system advanced in subsequent years appears from the steady increase of those numbers, till, in the last instance, at the Turin exhibition of '58, it reached the maximum of 1784, among whom 931 then received prizes.

INTERNATIONAL ART EXHIBITION, VENICE.

The Municipal Council of the City of Venice will hold their Tenth International Art Exhibition on April 15-October 31, 1912. Artists of international repute and those who have won distinction in national and foreign exhibitions are invited to send in works, but, with the exception of “one-man shows,” works already shown in Italy will be excluded. Goods must be delivered on the premises, Gardini Pubblici, not later than March 10, and artists, whether invited or not, will be allowed rebates of 50 per cent. for carriage, and will not be charged for unpacking or repacking. The Municipality will allot a sum for purchasing works of art, to be chosen by a committee of five elected by them, and to be then placed in the International Gallery of Modern Art. Communications should be addressed to the General Secretary, A. Feadeletto, Municipio di Venezia, and notification of intention to exhibit should be made before January 1 next.

MONTHLY REVIEW . of . CONSTRUCTION.

Measured Drawing. By Mr. F. J. Lenton. (See page 396.)

TIMBER IN ROOF COVERINGS.

MODERN roofs constructed for industrial purposes frequently consist of a steel frame on which is placed a timber covering carrying the load or other roofing material. Much variety of practice exists in proportioning purlins, common rafters, boarding, etc., and this covering; and, as engineers usually depart from the accepted standards of the older authorities in the management of these parts, the following rules have been compiled with a view to placing this matter on a rational basis, and enabling the designer to readily ascertain suitable scantlings for all ordinary cases.

Timber Beams.

In the majority of cases the timber employed is northern pine from Baltic or its Sea ports, the rules given are applicable to that material or other of similar strength. They may, however, be readily adapted to suit other timber if required. For convenience, loads are taken in pounds, spans in feet, breadth, depth, and

deflection of beams in inches, and stress in pounds per square inch. The following is the notation employed:—

- W = Total load in pounds.
- w = Load per foot run in pounds.
- F = Stress in pounds per square inch.
- E = Modulus in pounds per square inch.
- L = Span in feet.
- l = Span in inches.
- b = Breadth in inches.
- d = Depth in inches.
- Δ = Deflection in inches.

Published rules on which much building work has been based show that timber may be safely subjected to 1,200 lb. per square inch as a maximum stress in beams. Its modulus of elasticity may have any value between 1,000,000 lb. and 2,000,000 lb. per square inch; 1,500,000 lb. has been taken as a mean value.

As the usual bending moment and deflection formulae, such as $M = \frac{WL}{8}$, or

$$\Delta = \frac{5WL^3}{384EI}$$

do not immediately relate either load or deflection to scantling, the following table has been prepared, giving for the

more usual conditions of loading, the stress on the beam, the maximum safe load, and the deflection under a given load or stress, and the deflection with the maximum safe stress. All coefficients are reduced to their lowest terms and decimal coefficients are avoided, so as to make the formulae readily available for cancelling or for solution on the slide rule. Formulae for cantilevers have been included to make the table more useful for general reference.

Fig. 2. Wind Pressure Normal to Slope of Roof.

Fig. 3.

Wind Pressures and Snow Loads.

One of the principal loads to which roof timbers are subjected is the pressure due to the wind, and associated with it and closely interdependent on it we should consider snow loads.

Closely compacted snow may be taken as weighing 5 lb. per cubic foot, and the maximum depth to which it is likely to lie on roofs of flat pitch may be taken as 2 ft. in these latitudes. On steep pitches less snow will lodge, and it may be taken for granted that a heavy snow load and a high wind pressure will not occur at the same time, as the high wind would dislodge the snow.

Of the rules for determining the pressure of the wind normal to the slope of a roof, the pressure on a vertical plane being given, the best known are those of Duchemin and Langley, and Unwin (based on Hutton's experiments).

Let P = Pressure in pounds per square foot on a surface normal to a horizontal wind.

p = Pressure in pounds per square foot normal to the roof.

θ = The angle of the roof makes with the horizontal.

Then by Duchemin and Langley's rule—

$$p = P \frac{2 \sin \theta}{1 + \sin^2 \theta} \quad \dots \dots (1)$$

and by Unwin's rule—

$$p = P \sin \theta \frac{1 + 2 \sin \theta}{1 + \sin^2 \theta} \quad \dots \dots (2)$$

These rules, however, are both open to exception in that snow loads, which are variable with different angles, have to be separately computed. As tending to simplicity, the author proposes to use the following rule:—

$$p = P \sin (\theta + 15^\circ), \text{ for values of } \theta \text{ up to } 75^\circ, \text{ and}$$

$$p = P, \text{ for values of } \theta \text{ above } 75^\circ \quad \dots \dots (3)$$

This closely approximates to the pressures given by Rules (1) and (2) at the intermediate and higher angles, while at the lower angles it makes due allowance for snow loads.

Most authorities are agreed that it is unnecessary to allow for more than 40 lb. wind pressure per square foot on the most exposed structures, and that such pressure is only obtained at great height, and decreases in a somewhat indefinite way nearer the ground. As a convenient working rule the author uses the following:—

$$P = 4 \sqrt{H} + 5, \text{ for heights up to } 70\text{--}80 \text{ ft. above the ground, and}$$

$$P = 40 \text{ lb. per square foot above that level} \quad \dots \dots (4)$$

H being the height of the structure in feet. The diagram, Fig. 1, illustrates this variation of pressure, and will be found to agree fairly with the figures given by Goodman for wind velocities at various heights. ("Mechanics Applied to Engineering," Seventh edition. Page 503.)

A useful variation of the usual diagram of wind pressure normal to slope of roof, using the author's rule, is given in Fig. 2, in which the ordinates for a 40-lb. wind are set out radially at the angles corresponding to the roof slopes. If this is copied on tracing cloth it may be applied directly to any roof drawing, and the pressure to be allowed for may be read off without calculation.

Roof Coverings.

Table II. gives approximately the weight in pounds per foot super, and the limits of slope for the more usual roof coverings. Of these weights the component normal to the slope alone causes bending moment on the roof timbers, hence in calculations for scantlings, instead of the weight given in the fourth column, we use:—

Loading normal to slope, } $= w \cos \theta \dots \dots (5)$
excluding wind

Loading normal to slope, } $= w \cos \theta + 40 \sin (\theta + 15^\circ) \dots (6)$
and including wind

The maximum values of (5) and (6) within the limits of slope laid down are included in Table II. to the nearest pound per foot super.

We have also to allow for the occasional presence of workmen on the roof to effect repairs. As an approximation this will be considered equivalent to a concentrated load of 150 lb. applied anywhere, no allowance being made for reduction of bending moment

due to slope of roof. On roof boarding it may be assumed that, owing to the intervening roof covering, e.g., slates and battens, or zinc, or owing to tongues on the board themselves, this load is carried by a width of 18 in. In the case of boarding or common rafters, to prevent damage to the roof covering, the added deflection due to this occasional load should be limited to $\frac{1}{4}$ in.

Spans should always be taken between centres of bearings, no allowance being made for continuity, since joints are usually made over supports, and it is difficult to avoid pieces extending over not more than three supports, in which case the maximum bending moment is the same as in a single free span. The only case where an allowance for continuity is justifiable is where the end bay are made $\frac{7}{8}$ of the general length of bay and the joints are at $\frac{1}{2}$ of the length of the bay from the supports, as in Fig. 3. A this arrangement is unusual and special, no allowance has been made for it in the rule given hereunder.

Unless specifically described as finished sizes, an allowance must be made from the quoted scantlings of timber for sawn shrinkage, etc. The author has taken unwrought timber to be $\frac{1}{8}$ in. less in each direction than its nominal size, boarding wrought on one side, $\frac{1}{4}$ in. less than its nominal thickness, and scantlings wrought all over, $\frac{3}{8}$ in. less than nominal size.

Roof Boarding.

This must be proportioned for the following loads and deflections:—

Condition 1.—A distributed load of 43 lb. per foot super, including wind. (Table II., f.) As this requires a less thickness ($d = \frac{L}{6 \cdot 1}$) than Condition 5, it may be ignored.

Condition 2.—A distributed load of 12 lb. per foot super, excluding wind (Table II., f), and a central load of 150 lb. on 18 in. width. When less than 3·38 ft.

$$d = \frac{\sqrt{L^2 + 167 \cdot L}}{11 \cdot 55} \dots \dots (7)$$

Condition 3.—Deflection $\frac{1}{4}$ in., with central load of 150 lb. on 18 in. width. When L is greater than 3·38 ft.,

$$d = \frac{L}{4 \cdot 7} \dots \dots (8)$$

Table III., giving the thickness of boarding for any span, is based on the above. Where boarding is laid diagonally, the span should be measured along the diagonal.

i. Tiles and purlins	30°	70°	20	17	48

Common Rafters.

nominal width 2 in., spaced 1 ft. apart, 1 ft. 2 in. centres.

tion 1. A distributed load of 46 lb. per foot super, including wind. (Table II, k).
tion 2. A distributed load of 15 lb. per foot super, excluding wind (Table II, h), and a central load of 150 lb. on one rafter.
tion 3. Deflection $\frac{1}{4}$ in., with central load of 150 lb. on one rafter.

The formulae for the nominal depth to st each condition are summarised below:—

CONDITION 1.

Minimum nominal depth of rafter of span L when
had to size. Sawn. Wrought all over.
 L L
 $2 \cdot 23$ $2 \cdot 19 + \frac{L}{2}$ $2 \cdot 12 + \frac{L}{2}$. . . (9)

CONDITION 2.

L L
 $2 \cdot 17 + 14 \cdot L$ $2 \cdot 17 + 14 \cdot L$ $2 \cdot 17 + 14 \cdot L$. . . (10)

CONDITION 3.

L L
 $2 \cdot 26$ $2 \cdot 26 + \frac{L}{2}$ $2 \cdot 19 + \frac{L}{2}$. . .

Table IV. is based on the above. The nominal spans are determined by the condition where marked by an arisk, and in all other cases by the first.

TABLE IV. COMMON RAFTERS.
Spaced at 1-ft. 2-in. centres.

Nominal dimensions.	Maximum Span.			
	Finished to Size.	Sawn.	Wrought all Over.	
2 in. x 4 in.	4 ft. 11 in.	4 ft. 11 in.	4 ft. 11 in.	
3 in. x 4 in.	5 ft. 11 in.	5 ft. 7 in.	5 ft. 11 in.	
3 in. x 5 in.	7 ft. 7 in.	7 ft. 2 in.	7 ft. 7 in.	
4 in. x 4 in.	8 ft. 11 in.	8 ft. 7 in.	8 ft. 11 in.	
4 in. x 5 in.	10 ft. 11 in.	10 ft. 9 in.	10 ft. 11 in.	
4 in. x 6 in.	12 ft. 3 in.	11 ft. 11 in.	11 ft. 3 in.	
6 in. x 4 in.	14 ft. 3 in.	13 ft. 0 in.	12 ft. 4 in.	

Purlins.

t will be seen from Table II. that there three principal cases to be considered:—

- Lead or zinc flats.
- Light roofs of corrugated-iron or zinc.
- Slated or tiled roofs.

The slight differences in weight between coverings classified together are not of sufficient importance to require separate rules. With purlins the deflection canon may be omitted, since, in relation to comparatively large distance between the purlins, the deflection under the maximum es is too small to injuriously affect the covering.

a. Lead or Zinc Flats.

tion 1.—A distributed load of 33 lb. per foot super, including wind or snow. (Table II, c).
 bL^2 R^2 (11)

tion 2.—A distributed load of 13 lb. per foot super, excluding wind or snow (Table II, e), and a central load of 150 lb. on purlin.

$$bL^2 = \frac{R^2 + 2345 L}{10 \cdot 25} \dots (12)$$

hen BL is more than 30 ft. super. use equation (11), when less use equation (12).

b. Corrugated-Iron or Zinc Roofs.

COLOURING OF WOOD TO INCREASE ITS INDUSTRIAL VALUE.

H. WISCONSINUS has investigated the action of gases and vapours in the industrial colouring of various woods with the following interesting results. He finds that such improvement of the colour and of the artistic effects consequent thereupon is entirely distinct from those produced by mere "daubing" of the surface. Organic colouring matters dissolved in alcohol penetrate wood deepest, but are not the best colours; colours dissolved in water only penetrate a fraction of a millimetre below the surface of the wood in the direction of the length of the fibres, while turpentine and wax colours only affect the surface. In order to stain wood throughout its mass, apparatus similar to that used for impregnating wood with tar, etc., must be employed. Although tar gives a not unpleasant brown colour to wood, it is not a true colouring material. On the other hand, gases, and especially ammonia, have the power of rapidly producing the deepest colours in wood. Only small amounts of gases or vapours are required to colour the mass of the wood. The change of colour is really produced by the action of the gases on those unstable and easily decomposable constituents of the sap and woody substance, which are readily separated from the resistant cellulose fibres; tannins, and less resistant carbohydrates, such as sugars, gums, etc., are turned to a dark colour by alkalis, ammonia, and superheated steam, or are decomposed with the formation of brown "humus" bodies. Fibres are easily penetrated by gases and vapours, and the colouring effects are heightened by such factors as high temperature, light, moisture, oxidising agents, etc.

A characteristic of these processes is the throwing into bold relief of dull, mat, tones of colour, which produces the impression of colour from age, and, in fact, the object of these processes is to hasten those natural changes which occur in the ageing of wood. Cut wood turns yellow or brown naturally under the influence of the oxygen in the air, light, warmth, and moisture, and the coloration is also affected by dust (especially particles of iron), fungi, bacteria, and the action of the ultra-violet rays of light and heat. The side exposed to constant rain and snow becomes grey, the side exposed to the sun according to its age becomes more or less brown, and the freely-exposed ends of beams of very old houses become quite charred. The brown colour is a typical superficial colour, which is easily removed by moist ammonia fumes, and the surface then consists of pure white cellulose fibres, which give no lignin reactions. In low-lying country wood never acquires the exquisite brown observed in the Alpine district.

Wood exposed freely to air and protected from moisture acquires a superficial grey colour, probably formed by the action of traces of iron on the sap materials, and entirely distinct from the grey colour due to age which penetrates the interior of the wood. Among artificial processes of colouring wood the comparatively new process of "fuming" with ammonia has only been applied to woods rich in tannin materials in order to produce the greyish brown of old oak. The wooden articles are enclosed in a vessel filled with air and ammonia fumes for two or three days, and are coloured to a depth of from 2 mm. to 3 mm. = 0.78 in. to 1.18 in., which is much deeper than would be effected by liquid colours. In cases where tannin material must be added to the wood, a 5 to 10 per cent. hot solution of pyrogallol is used. Solutions of salts which can be coloured by ammonia or sulphuretted hydrogen are also employed, but only the surface is coloured by them. Even for oak, the "ammonia fuming" process is limited by the varying amounts of tannin substance present, by the fact that only made articles can be fumed if a uniform appearance is to be obtained, and by the want of resistance of the colour to water. The steaming of wood is chiefly used in order to bend the wood, but it also produces a uniform brown colour throughout the mass, and with certain kinds of wood colouring by a gas process can often be combined with drying by means of superheated steam.

Another artificial process of colouring wood

brown and imparting to it the appearance of age consists in embedding planks and blocks in trenches in the ground and covering them with loose earth or coal cinders. The loose soil is wetted with rain or by watering, and the draining off of the water maintains a moist atmosphere in the soil. The colouring is brought about by the soil gases—water vapour, air, ammonia, carbonic acid, and possibly hydrogen peroxide. Soils with a low content of humus are suitable, and the ammonia may be increased by adding ammonia-producing substances to them. The process is essentially different from the colouring of wood by laying it in mud, slime, or soil soaked with manure, as in the case of "sub-fossil" woods found in bogs.

REINFORCED CONCRETE FLOORING BUILT WITHOUT MOULDS.

Ws already have at hand in this country several methods of constructing reinforced concrete floors without the employment of the customary moulds and centring. All of these have been described and illustrated in our columns at different times.

The system to which we now direct attention is one employed at the University of Wisconsin, where it has been found practical, economical, and effective. It embodies an arrangement of narrow beams spaced about 3 ft. apart, centre to centre, and braced by transverse beams of equal dimensions spaced 6 ft. 6 in. apart, with girders of similar construction at intervals (see Fig. 1).

The beams are moulded in the spaces between a temporary staging formed of wooden boxes with sloping sides and ends as shown in Fig. 2, laid upon a system of supporting planks held in place by timber struts.

Concrete and reinforcement are placed in the intervals to form the beams, and the connecting floor slab is spread over the beams and the top of the boxes, this part being reinforced with wire netting and finished by a granolithic surface.

The reinforcement of the beams as represented in Fig. 3 consists of round bars enclosed in stirrups of U-form, several stirrups being bent from one rod to form a connected series. The bars are only used in tension, but are bent up over the supports in the case of joists and bridging joists, while in the girders straight bars are employed with short bars for contraflexure in the upper part near the supports. Calculations for the reinforcement were made by the Dean of the Engineering Department of the University.

Mr. Arthur Peabody, Supervising Architect to the University of Wisconsin, states that during the past two years spans of from 12 ft. to 26 ft. have been successfully moulded, and that some floors of 28 ft. span are being made this year. These necessitate beams measuring 8 in. wide at the bottom, 10 in. wide at the top, and 14 in. deep. The increased width of the beams at the top adds to the crushing resistance of the construction, and the narrower bottom where tension in the concrete is neglected is sufficient and economical.

The calculated strength of the floor is entirely in the beams, no account being taken of the slab, and none of the bridging joists. The value of these two elements is considerable, and we see no reason against taking them into account, as will certainly be done if the system comes to be developed commercially.

By providing enough boxes for one or two floors an entire building, and many other afterwards, can be constructed with a minimum expenditure for plant. If preferred, however, sufficient boxes can be made for all the floors of a given building, and the floor slabs formed after the whole of the beams have been moulded.

The intervals between the boxes can easily be varied to make the beams of any required width, and the depth can be increased by placing troughs on the supporting planks or by increasing the thickness of the floor slab.

As first made at the University, the timber boxes were of pine sheathed with yellow pine floor-boards carefully put together and finished smooth. The cost per box was about 10s. each, and the boxes were used fifteen times without a great percentage of loss. They were then covered with sheet-iron at a cost of about 6s. each, rendering them suitable for use fifteen times more.

FIG. 1 PLAN

FIG. 2 BOXES READY FOR CONCRETING

FIG. 3 SECTION OF COMPLETE FLOOR

Reinforced Concrete Flooring built without Moulds.

Experience shows that it is economical to sheath the boxes with sheet-iron in the first instance, thus saving the cost of finishing the wood smoothly, and the metal surface slips away from the concrete more readily than timber. Moreover it is free from the disadvantage of absorbing moisture from the wet concrete, and obviates swelling of the wood.

The life of the boxes depends very much on the treatment they receive. If adequately protected with sheet-iron along the lower edges as well as on top and on the sides and ends, there is no reason why they should not last for a long time.

In the subjoined table we give the cost of floor construction in the Mining Laboratory at the University of Wisconsin. The floors in question covered about 4,500 sq. ft., and the superimposed loading was 200 lb. per square foot.

	Per sq. ft.
Concrete (limestone aggregate)	5.27
Reinforcement	3.93
Timber for supports	3.30
Timber boxes, one-fifteenth original cost	0.36
Erecting supports and boxes	2.77
Placing reinforcement and concreting	2.22
Removing supports and boxes	0.55
Total cost	18.40

WROUGHT-IRON GATES, UFFINGTON CHURCH (p. 893).

THESE old gates form the entrance to the churchyard of Uffington, a picturesque little "stone and thatch" village about 2 miles from Stamford. They are beautifully "set" at the end of a long paved path, which, with its grass border, bushes, and overhanging trees, has the appearance almost of an avenue leading up to and culminated by the church, with its fine spire; the vista so obtained through the wrought ironwork is delightful.

As is often the case, a great deal of the more delicate work—leaves, etc.—has rusted off, but enough remains to restore the whole.

Unfortunately, nothing is known of the history of the gates, but it is possible that the lady and gentleman whose distinctly Georgian features are graven on the torus were the donors.

On the opposite side of the road a fine pair of modern gates and piers, echoing these in many respects, give an equally entrancing view of the beautifully-kept Hall gardens, their blaze of colour contrasting pleasingly with the cool green of the churchyard.

CONSTRUCTION NOTES.

Comparison of Retaining Wall Designs.

The important economy that can be effected by the adoption of reinforced concrete in place of masonry or mass concrete in the construction of retaining walls has been sufficiently illustrated by numerous examples described in our columns on various occasions. In the present note we compare the cost of three types of design, one a plain concrete wall with reinforcement in the footing and at the junction of the footing and wall proper, and the other two representing commonly adopted forms of construction.

All three walls are practically of the same overall dimensions and suitable for equal load conditions. For the purpose of showing the extent by which the sectional area of concrete

FIG. 1

FIG. 2

FIG. 3

COMPARISON OF REINFORCED CONCRETE RETAINING WALLS

may be reduced by the aid of efficient reinforcement from a given thickness at the top of the wall, the uniform dimension of 18 in. has been adopted in each case, but it should be pointed out that considerable further saving might easily be effected in the cross-sectional area of concrete.

The subjoined table gives the comparative cost per lineal foot of the three designs as represented in Figs. 1 to 3:—

Materials and Unit Cost (including labour).	Type of Design and Cost per Foot Run.		
	Fig. 1.	Fig. 2.	Fig. 3.
Concrete at 24s. per cu. yd.	£ s. d. 5 4 0	£ s. d. 3 10 9	£ s. d. 3 2 2
Steel bars at 14d. per lb.	0 4 3	0 15 5	0 15 9
Moulds at 5s. per sq. yd.	1 0 7	1 0 7	1 13 0
64 sq. yd.			
Total per foot run	6 8 10	5 6 9	5 9 11

As the quantities of material are given for each type the reader can substitute his own unit prices if desired, but these will not affect the comparison of cost.

Adhesion of Concrete and Steel.

PROFESSOR BACH has recently made public the results of an investigation undertaken by him with the object of determining the resistance to longitudinal pulling-out of steel bars embedded in concrete for varied lengths of the surfaces in contact. Having pulled out bars of 0.79 in. diameter embedded in blocks of concrete for lengths ranging from 1.18 to 15.75 in., the author found that the axial adhesive resistance per square centimetre of surface in contact diminished uniformly as the length increased. For the dimensions of the bars examined Professor Bach found that the relation which exists between the adhesive resistance p per square centimetre, and the dimensions l = length and d = diameter of the bars tested can be thus represented by the exponential function:—

$$p = 160e - (0.2 + 0.4\sqrt{\frac{l}{d}})$$

where e = the base of Napierian logarithms. This formula appears to be applicable to bars up to 20 in. long.

New Process for Creosoting Timber.

AT a demonstration of the Rüping system of timber preservation last month various kinds of wood in the form of poles, fencing, battens, boards, sleepers, and paving blocks were treated. After having been weighed and measured, the specimens were placed in a cylinder, subjected to the air-pressure of 50 lb. per square inch, and then the cylinder was filled with creosote, first under the same pressure and next under 80 lb. per square inch. After the timber had been taken out, the quantity of creosote absorbed was ascertained by weighing, and, various specimens having been cut across, it became evident that the oil had penetrated nearly to the centre. The process is said to be very economical, one special advantage being the cleanliness of the treated wood.

End Elevation.

Longitudinal Section

Bolt Socket.

(From Engineering News.)

Simple Bolt Socket for Concrete Work.

FOR securing bolts in concrete buildings and structures the device recently patented by Mr. David Craig, of Boston, U.S.A., is one that should be found very useful. As shown in the accompanying drawing, it consists of a coil of wire, the coils spaced so as to form the thread of an ordinary coach bolt, the ends of the coil turned out tangentially to form an anchorage. To place the socket in position, it is fitted on a screwed bolt, of the size to be used afterwards, passed through the hole of the mould, and embedded when concrete is poured in. The bolt is afterwards withdrawn, leaving a screwed socket. The device is quite suitable for attaching hangers of all sizes to concrete and reinforced concrete structures, and has been successfully employed in construction work on the Boston Elevated Railway.

REFERRING to the beams of 80 ft. span described in our issue of August 11 last, it is interesting to note that the sag of these members under their own dead weight and of the connecting roof slab averages only $\frac{1}{8}$ in., the maximum deflection in one beam being $\frac{3}{8}$ in. As these two measurements respond to $\frac{1}{16}$ and $\frac{3}{16}$ in., the span, respectively, they are clearly indicative of sound and good construction.

Effect of Lightning on Reinforced Concrete.

A WELL-KNOWN civil engineer in America has recently made public his personal experience of the behaviour of concrete under attack by lightning. He states that a reinforced concrete water-tank at his residence was struck a short time ago without causing injury, the only effect having been to vitrify the texture of the concrete in the neighbourhood of the point of impact.

Influence of Transport on Properties of Concrete.

A NOVEL industry lately originated in some German cities is the preparation and supply of ready-mixed mortar and concrete. These materials are prepared in special works transported thence to building works progress. There can be no doubt that the plan of mixing under expert supervision should be beneficial in itself; while, on the other hand, it is to be feared that the delay, inseparable from loading, transport, and unloading, may affect the setting of the mortar and concrete, and that the jolting of concrete on the way from the mixing works may cause segregation of the constituents. In order to obtain reliable data on the two points in question, tests have been conducted on a series of specimens of concrete, taken before and after transport. According to the results published by the tests, it appears that the

transport of concrete actually increased the strength of the material by about 15 per cent., the increase being more noticeable in cases where aggregate with sharp edges had been employed. We are reluctant to accept this conclusion for general guidance, and besides, it is highly probable that in ordinary practice delays would occur in delivery, presenting considerable risk of inferior work.

Cheaper Railways.

MR. C. REGINALD ENOCK, F.R.G.S., in a paper read before the Society of Engineers, argued that the capabilities of the ordinary steam railway do not keep pace with the requirements of the times; that there are too many accidents; that travelling is too slow; the cost of construction too heavy; that freight and passenger rates are too high; labour insufficiently paid, and dividends less than they should be. He pointed out that the mountainous regions of the globe are still undeveloped, due to heavy cost of railway construction. He stated that the heavy cost of English railways is largely due to land purchase. He considered that radical changes in design and construction are now called for, in the interests of safety, rapidity, and economy. He urged that national experiments should be carried out on a specially-equipped site, in order to give greater scope to inventors and to evolve improvements; and suggested that inquiry might be made into the possibility of a combination of railway and aeroplane.

Cost of Industrial Buildings.

A USEFUL comparison given in a paper contributed by Mr. J. P. H. Perry to the National Association of Cement Users (U.S.A.) relates to the cost of reinforced concrete, protected steel-frame, and "mill construction" factory buildings. The figures quoted were furnished by the tenders for buildings erected in various parts of the United States. Neglecting "mill construction," which finds no exact counterpart in this country, Mr. Perry's data show that the cost of reinforced concrete ranges from 2.8 to 13 per cent. less than that of fire-protected steel, the exterior walls being assumed to be of equal value.

The author justly urges, however, that initial outlay is not the only consideration, and that owners should also take into account the fixed annual charges, including interest, insurance, depreciation, the effects of vibration, and sanitation. Some saving in the first two items can probably be effected by reinforced concrete, and as the depreciation of the same material is not more than about 0.5 per cent. per annum, maintenance charges ought to be considerably reduced, while they would be vastly less than in buildings where steelwork is exposed to the air.

Freedom from vibration is one of the chief points of superiority characterising reinforced concrete as compared with steel-frame construction, and on this count Mr. Perry estimates

the saving in machinery repairs to be one well worth attention. Among hygienic advantages he places resistance to the attack of vermin, and increased facilities for the admission of light.

Taking all things into account, the author urges that it would pay owners to adopt reinforced concrete even if the initial cost of the building were higher than that of a protected steel structure, and that the advantages of reinforced concrete construction are still more pronounced when compared with buildings erected in accordance with ordinary methods. The question is one quite deserving inquiry.

Medieval Reinforced Concrete in Paris.

A STRANGE discovery lately made in the walls of the old palace of the Louvre shows that reinforced concrete was by no means unknown in Paris as far back as the XVIIth century, when the rebuilding of the Louvre was undertaken by that industrious builder, Francis I. The *Figaro* states that when executing works in connexion with the application of a modern lift the workmen employed found it necessary to cut through some of the old walls, which were apparently of dressed masonry. But, to the surprise of the contractors, it was found that the stone was nothing but the outer shell of construction largely composed of a kind of reinforced concrete. In view of the generally entertained belief that this is an essentially modern variety of structural material, the proof of its employment between 300 and 400 years ago is distinctly interesting. Our contemporary states that some one with archaeological tastes has taken the trouble to search the archives for records left by the architects of the epoch in question, with the result that no mention was found of anything but dressed stone for use in the walls. It seems, therefore, that the original contractors, with more wisdom than honesty, decided to make sure of reaping the benefit attending the adoption of reinforced concrete as a substitute for stone masonry.

Partition Walls States Consul-General at Berlin in Berlin.

FROM a report by the United States Consul-General at Berlin it appears that most of the inner partition walls used in buildings in that city consist of a heavy iron wire screen, on either side of which are layers of coke-ash mortar. The walls are apt to get out of plumb, and will not hold nails satisfactorily, and, as in making the mortar cattle hair, jute, and hemp refuse are used, it sometimes disintegrates, causing the wall to crumble and sections to fall out. A good metal partition wall should, therefore, says the Consul-General, find a market in Germany, provided that it was not too thick and that the cost was not very much greater than that of the ordinary wall. Economy of space is looked for by the German builder. The authorities require that all outside and supporting walls shall have a thickness of at least 36 cm. (14.173 in.), and hence partition walls are generally limited in thickness to 10 cm. (3.937 in.), as they are not required to support great weights. The coke-ash walls cost about 3.20 marks per square metre (about 2s. 8d. per square yard), but builders would pay more for a wall of satisfactory construction.—*The Engineer*.

Danger of Iron Bolts and Ties in Masonry.

IN most cases where iron has been leaded into stone cracks have sooner or later appeared owing to increased bulk of the metal by oxidation. The only way of obviating such cracks is to make a perfectly tight joint between the two metals. As lead does not in any way adhere to iron tightness can only be secured by efficient caulking. This can only be accomplished where (a) the section of the iron bar is circular, (b) the hole in the stone is of the same form, (c) iron fixing wedges are eliminated, (d) there are no projections on the surface of the bar, and (e) the lead is sufficiently ductile.

THE BUILDING TRADE.

THE APPOINTMENT OF AN ARBITRATOR.

OF the building cases which from time to time come before the courts for decision a considerable number involve the consideration of an arbitration clause. For good or ill, parties to these agreements depend upon arbitration for the settlement of disputes, and while the appointment of an arbitrator is often made in the contract itself, it often becomes necessary for the builder to consider who had best arbitrate for him. It may be, of course, that all questions in dispute are left to the architect, but it is more usual to provide in the agreement that disputes shall be determined by arbitration in accordance with the terms of the Arbitration Act.

While an unprejudiced person should always be chosen, the parties are at liberty to choose whom they will, or to name some indefinite person, such as a gentleman nominated by the President of the Institute of British Architects. The mere fact that the arbitrator had some bias at the time of his election would not, if the fact were known to both parties, be sufficient to avoid his appointment. Where, however, it turns out that, unknown to one or both of the parties, he submit to be bound by his decision, there are some circumstances in the situation of the arbitrator which tend to produce a bias in his mind, he is an improper person to act as an arbitrator. Even in the common case where either party appoints an arbitrator, who are empowered to appoint an umpire in case they cannot agree, the arbitrators so appointed should be without bias. In a case decided in 1845 the appointment of the surveyor of a railway company to act as their arbitrator in a dispute was held to be objectionable, and in a much later case the court threatened to revoke a submission where an insurance company appointed their own manager to act as their arbitrator.

In a Scotch case, a firm of contractors who had undertaken to build a public building agreed with the Town Council that a particular gentleman should act as arbitrator in case of dispute. This gentleman subsequently became elected "Dean of Guild," and thereby *ex officio* a Town Councillor. It was held that this disqualified him from acting as arbitrator (*Edinburgh Magistrates v. Lowrie*, 1903, 5 F. 711).

The case of *Belcher v. Roedean School*, 1901, 85 L. T. 469, shows that the court will be reluctant to revoke a submission to arbitration on the ground of interest. In that case a contract provided that all disputes and differences arising on a building contract were referred to the decision of the architect appointed by the building owners. The builders issued a writ against the architect for damages for fraud and misrepresentation, and took out a summons to revoke the submission to arbitration. The architect declined to admit the charges made against him. It was held that an application to revoke the submission was one to be granted with great caution, and that the submission ought not to be revoked. If the clause providing for arbitration mentions no other mode of reference, it is to a single arbitrator; but the parties can agree that there shall be two arbitrators, and if so the two arbitrators may appoint an umpire within the period during which they have the power to make an award. In the case (c) where the submission provides for a reference to a single arbitrator, and all the parties do not, after differences have arisen, concur in the appointment of an arbitrator; or (b) if an appointed arbitrator refuses to act, or is incapable of acting, or dies, and the submission does not show that it was intended that the vacancy should not be supplied, and the parties do not supply the vacancy, any party may serve the other parties with a written notice to appoint an arbitrator. If the appointment is not made within the proper time, the court may make the appointment. A reference, as we have seen, is frequently made to two arbitrators, one to be appointed by each party. Provision is made by the

Arbitration Act for the failure of one party to make the appointment. If one party to the arbitration were to refuse to make any appointment, the arbitrator selected by the other might sit as sole arbitrator and decide the matters in dispute, subject, however, to a power reserved to the court to set aside any appointment by the other. If the person chosen to decide matters in dispute refuses to act or dies, it is competent for one party to call upon the other to appoint a new arbitrator. If he refuse to do this, the court may then make the appointment.

It is well to make a very distinct arrangement about fees before the arbitrator enters upon his duties. To estimate the exact amount payable is, of course, a difficult task, inasmuch as there is no telling for how long the hearing will last. The "retainer" and a daily "refresher" can, however, be fixed without any difficulty. It is to be borne in mind that an arbitrator is entitled to keep back his award until his fees are paid, and this is a method of compulsion not infrequently resorted to. The usual practice, therefore, is for the arbitrator to notify the parties the amount of his charges, and to refuse to deliver the award or communicate its contents until they are paid. This obviates all disputes, and the practice has received repeated judicial sanction.

Sometimes a taxing officer is called upon to decide under sect. 15 (3) of the Arbitration Act, 1889, as to the fees of an arbitrator. It has been decided that upon such a taxation the taxing officer is not entitled, if the evidence all goes to show that, in the opinion of persons in the same profession the charges made by the arbitrator are for a person in his position fair, to disregard that evidence and to reduce the remuneration to such an amount as is in his opinion fair (*Mason, Ltd., v. Lovatt*, 1907, 23 T. L. R. 486).

In that case a quantity surveyor had acted as arbitrator in a dispute between a firm of plumbers and a builder. The reference lasted for twenty-two days, and the arbitrator was subsequently employed for thirteen days in considering the case. He also took the advice of solicitor and counsel on certain points of law. He charged 527l. 10s., which included 107l. 10s. a day for thirty-five days, and 110l. 6s. for fees paid for legal advice. The District Registrar, disregarding the evidence of surveyors in good position, held that 51. 5s. a day was sufficient, and reduced the above amount by 283l. 0s. 6d. The Court of Appeal set this judgment aside. Dealing with the surveyor's remuneration, Lord Justice Moulton said:—"The evidence is all one way that the price charged by him was fair for a person belonging to his profession and occupying the position which he occupied in that profession. The District Registrar was not entitled to set that evidence aside. The true standard, in my opinion, of what should be paid in such a case is what a fair-minded man in the position of the referee would have required if a bargain had been made freely beforehand. In this case there is no ground for supposing the referee has charged more than would have been required by a fair-minded man in a free bargain."

One word may be added as to the relative merits of legal and lay arbitrators. There is a very natural feeling rooted in the mind of the business community that a technical man should decide a technical case. It may be granted that an architect will require less instruction upon the technical aspect of a building dispute than most lawyers. But as the architect chosen as arbitrator accustomed to hear evidence; is he able to distinguish the true from the false; wholly unbiassed by any pet theory of building? These are matters to be thought of before the lay arbitrator is hastily chosen. There are many gentlemen in both branches of the legal profession who have had considerable experience in building cases, whose claims should not be lightly rejected. Perhaps the most satisfactory, although most costly, of all tribunals hitherto devised is that composed of two laymen sitting as arbitrators representing each party, presided over by a legal umpire selected by the two arbitrators.

EXTRAORDINARY TRAFFIC.

The case of *Billerica Rural District Council v. Poplar Guardians and Keeling* which we noted the *Builder*, April 14, has been carried to the Court of Appeal, which has approved the judgment of the Court below. We referred to the case in our issue of last week, p. 370.

Under the Highways and Locomotives Act, 1878-1893, it is provided that where, by the certificate of their surveyor, it appears "having regard to the average expense of repairing highways in the neighbourhood," extraordinary expenses have been incurred in repairing a highway by reason of extraordinary traffic, the authority may recover "the amount of such expenses as may be proved to the satisfaction of the Court to have been incurred by such authority by reason of the damage arising from such weight of traffic." In the case in question the Court found that there had been some damage necessitating an expense greater than usual but that as the rates had not thereby been increased the action failed. The Court of Appeal have approved this finding, but present the decision is not fully reported. It would seem, however, that the case must have turned upon the absence of any proof that "extraordinary expenses had been incurred," and not, as appeared in the Court below, solely on the fact that the highway rate had not been increased. It is obvious that this fact alone can form no criterion, for the highway authority, by economy in methods of maintenance, or by expenses incurred in previous years, might, in fact, reduce the highway rate whilst yet including an item for extraordinary traffic. We shall await the full report of the decision with interest.

MASTER PAINTERS' CONVENTION: THE EIGHTEENTH ANNUAL DINNER AT DERBY.

The annual dinner in connexion with the Convention of the National Association of Master House Painters and Decorators of England and Wales was held at Derby on September 27. The President, Mr. Fred Grundy, presided, and he was supported by several ex-Presidents, while among the visitors were the Deputy-Mayor, Dr. H. Arnold-Bemrose; the Town Clerk, Mr. G. Trevelyan Lee; the Principal of the Technical College, Mr. F. W. Shurlock, and others.

The Deputy-Mayor, in responding to the toast of "The Town and Trade of Derby," remarked that "they had the primeval man who lived in caverns at a time when there were no houses to decorate. That he was of an artistic temperament was shown by his finding in a cavern at Cresswell of the first art memorial in the shape of the head of a horse engraved on the antlers of a deer. Paint was evidently used at that time—composition of charcoal, oxide, of manganese, and some sort of grease, which showed that the arts of the painter did not begin when man commenced to live in houses."

In submitting the toast of "Technical Education," Mr. G. H. Morton expressed the opinion that, considering the vast amount of money spent on education, the results were nothing like what they should be.

Mr. F. W. Shurlock (Principal of the Technical College), in responding, said it was the first time that the toast had been given in the town, and that the Master Painters had adopted it was very encouraging. The subject was of vital importance, and there was no doubt that it was not receiving the consideration it deserved in this country. There were different conceptions as to the usefulness of the work undertaken. His conception of technical education was, the highest training in the principles of sciences and art given to the ablest and best of the young people in their industries. He congratulated the Association on the interest they had displayed in educational matters. He only wished that

associations of employers would follow as an example, and particularly, trades, for in these days they could not hope to go back to the old arrangements when in guilds masters and apprentices were lated one with another. They had, unfortunately, got beyond the parting of the ways in that particular, and the masters and would probably live to remain separate in the future. Signs were not wanting that Association was filling up the breach. A feature of the Exhibition, which could like to refer to, was the work done by the apprentices, and the work done under Fletcher reflected great credit on the Master Art School. With regard to the Art School, he was pleased to say they had fifteen painter apprentices from the Art Association. They were instructed in principles of drawing, and so far as this it was healthy and useful. There was a reason why they should not have decorated the College; if a reasonable number of pupils came forward, such a class, no doubt, could be started immediately. The chief toast of the evening, "The Royal Association of Master Painters of England and Wales," was proposed by Mr. Torpe, who said he had watched the movement of the English Association for a considerable time, and he could say they had avowed to lift the craft to a genuine standard and had tried to make it, not merely a craft, but that it should deserve first and last afterwards the respect of the public whom they catered. It had been a growing conviction with him that of all the associations of England was the most business-like. It set itself out to do great things, and variously succeeded, and those things were very pertinent to its functions in life. On the question of technical education one great lack had been made. While every attention had been given to the class generally, bright boy who showed every promise had not received the particular encouragement merited. If more attention had been paid to particularly bright boys they might become leaders of a great movement in the future. Responding, the Chairman said that the exhibition, starting in a small way, had in it something to be proud of. It was good wine, it needed no bush, and both a social and business point of view was worthy of its position in the painting.

GENERAL BUILDING NEWS.

NEW CHURCH AT GRANGETOWN.
The Lord Bishop of Durham has consecrated the new church of St. John, Grangetown, Sunderland. The church is built of Lincolnshire bricks, with walls of Dumfriesshire stone. The late Mr. C. G. Fowler, F.S.A., was the architect, Mr. W. H. Wood, F.R.I.B.A., has supervised the work. Messrs. J. & T. Parker, Sunderland, are the builders.

CHURCH HALL, WATERLOO.
The church hall is being erected in connexion with the Church of St. John, Waterloo, Liverpool, from designs by Messrs. F. B. Hobbs & O. D. Black, F.F.R.I.B.A. The cost will be about 3,600.

NEW SCHOOL FOR NORWICH.
The Corporation has been decided to build a new elementary school in the suburb of Lakenham, Norwich. Such an institution has been needed some time, and a good opportunity is offered to obtain an important building.

SCHOOLS AT WOOD GREEN.
The Corporation has proposed to build new elementary schools at Lordship-lane, Wood Green. The plans have been approved by the Board of Education.

SECONDARY SCHOOLS, HARROGATE.
These schools were opened by the Bishop of York on September 28. The original building has been remodelled and an extension costing 8,500, has been made. The buildings consist of four floors, and are to be used as a secondary school during the day, and a musical and art school in the evenings. In the basement are placed the following rooms: laundry, manual room, boys' and girls' dressing-rooms with kitchen, scullery, and stores. The ground floor are an assembly-room, a library, 34 ft., six classrooms, masters' and resses' rooms, headmaster's room, and a boys' and girls' cloakroom and lavatory. On the first floor are four classrooms, physics

laboratory, chemical laboratory with balance-room and stores and lecture-room, large commercial classroom, room for needlework and dressmaking, large cookery room and masters' room. On the second floor is arranged the art department, consisting of antique-room, modelling-room, elementary art-room, painting-room, painters' and decorators' room, room for wood carving, besides masters' room and boys' and girls' cloakroom and lavatories. In an adjoining building, connected by covered corridors, is a gymnasium, 50 ft. by 36 ft., with changing-rooms for each sex. The whole of the rooms are well lighted, and the heating and ventilation is of the best type. Playgrounds for each sex are provided with covered sheds and bicycle rooms. The total cost of the complete block has been about 13,000. The architects for the extension are Messrs. W. J. Morley & Son, of Bradford, who were also responsible for the original building.

BRADWELL, BUCKS.

At a meeting of school managers and County Council representatives, held at Bradwell, it was decided to petition the Aylesbury Education Committee to provide a new boys' school at a cost of 6,000.

ROMFORD BOYS' SCHOOL.

A secondary school for boys is to be built at Romford. Building is going on rapidly in the district, and the need for special accommodation is felt.

BRISTOL BAPTIST COLLEGE.

It is expected that tenders will be invited shortly for the construction in Tyndall's Park of the Bristol Baptist College, the cost of which is estimated to be about 16,000. Messrs. Oatley & Lawrence are the architects.

SCIENCE DEPARTMENT, SHEFFIELD UNIVERSITY.

The Drapers' Company have given 15,000, towards the cost of an Applied Science Department in connexion with the Sheffield University. The architects of the new building are Messrs. Gibbs, Flockton, & Teather, Sheffield.

NEW INSTITUTE AT HAROLD, BEDFORDSHIRE.

The new institute has been erected on a site adjoining the present institute, and comprises a large hall, committee-room, kitchen, etc. The architect for the work was Mr. M. Clayton, and the contract was carried out by Messrs. Clayton & Sons.

CHURCH INSTITUTE, SOUTH SHIELDS.

This building, which has been formally opened in Hardwick-street, South Shields, is part of a scheme to provide for the religious, educational, and social needs of the parish. Mr. J. H. Morton, F.R.I.B.A., was the architect, and Messrs. Sheriff & Sons, South Shields, were the contractors.

WESTON-SUPER-MARE.

Mr. E. K. North, M.Inst.C.E., an Inspector of the Local Government Board, has held an inquiry in connexion with the proposed purchase by the Urban Council of land at Weston-super-Mare, the object being the provision of public abattoirs, cattle market, depot, refuse destructor, and workmen's dwellings.

OUTFALL SEWERAGE SCHEME.

The Rhymney Valley authorities have decided to seek Parliamentary powers to construct a sea outfall sewerage scheme to cost something over 200,000. The 50,000, allowed for the construction of a trunk sewer from the north of the valley down the Tyn-y-coed is included in the estimate.

HULL TOWN HALL.

The second portion of the new Town Hall at Hull having been completed, and the Council having decided to take down the front portion to rebuild it in a style more in keeping with the remainder, tenders have been considered by the Property Committee of the Corporation. The architects (Messrs. Russell & Co.) estimated the cost of the work at 25,000, and the tender by Messrs. Quibell, Son, & Greenwood, which was accepted, was for 25,378.

PUMPING STATION, MEOPHAM.

The tender of Messrs. W. H. Archer & Son, of Gravesend, has been accepted by the Gravesend and Milton Waterworks Company for the erection of a new pumping station at Walnut's Wood, Meopham. The cost of the work will be about 6,000.

POST OFFICE, LLANELLY.

A new post office has been erected at Llanelli by H.M. Office of Works. It is a three-story building, with a frontage of 113 ft.

SANATORIUM EXTENSION, EXETER.

The Exeter City Council propose to spend 15,500, in extensions to the Sanatorium. If possible, the work will be done during the winter, so that employment may be given to mechanics and artisans.

PARISH HALLS, PORT-GLASGOW.

Mr. Allan F. Duncan, of Glasgow, is the architect of the new parish church halls to be built in the Port-Glasgow Bay Area, and Messrs. Peter McBride & Co., Port-Glasgow, are the contractors.

BURSLER TOWN HALL.

At the formal opening of the new Town Hall at Burslem, designed by Mr. S. B. Russell, F.R.I.B.A., the Mayor (Major Cecil Wedgwood, D.S.O.) had something to say on the subject of present-day decorations. He thought his audience would agree with him when he said that the new Town Hall was a very handsome building. The taste which had been displayed was excellent, for the decoration was of a reticent character. In present-day decoration they were apt to run very much to detail of ornament, and were too apt to forget the value of good proportion and simplicity. He was always laughed at by his friends because he admired the entrance to Euston Station. What appealed to him about the entrance was the simplicity of that enormous arch. He thought that in carrying out the decoration of their own building the idea had been to avoid plastering it all over with ornament. It was very often the case that over-ornamentation was used to hide faults, and also to smother bad proportions. It was the most difficult thing in the world to obtain simplicity and good proportion, but he did think that in that building they had a stately structure. Mr. R. O. B. North, clerk of works, in the absence of the architect, described the building.

TRADE NEWS.

The use of the "Ceresit" waterproofing medium for concrete, stone, and brick buildings was successfully demonstrated last year at the Brussels Exhibition, where the highest award was secured. The "Grand Prix" of the Turin Exhibition has been awarded to "Ceresit."

The Yale & Towne Company, 6, City-road, E.C., have a "Window Display" advertisement leaflet, which may be had on application by ironmongers.

The Union Infirmary, Sevenoaks, is being supplied with Shorland's warm-air ventilating patent Manchester grates by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

THE BUILDING TRADE IN MANCHESTER.

It is expected that a favourable reply will be sent by the Manchester, Salford, and District Building Trades Employers' Association to the Labourers' Union on the question of increased wages and revised working hours for labourers.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Church hall (1,800l.); Mr. George Kenshole, architect, Hongoed; Mr. D. Tysul Davies, builder, Treconan.

Aberdeen.—Extensions to premises of Northern Co-operative Society (4,000l.). Messrs. Wilsons & Walker, architects, 1 and 1A, Union-street, Aberdeen.

Adwick-le-Street.—Police station; Messrs. Denholm & Co., builders, Black-lane, Westgate, Wakefield.

Annfield Plain (Durham).—Proposed sixty houses; Mr. T. J. Trowsdale, Surveyor, Annfield Plain Urban District Council.

Backbarrow.—Cottages for the Leven Valley Co-operative Society.

Barnsley.—Enlargement of Holyrood Roman Catholic School (400 extra places); the Trustees.

Blaimachfoldbach (near Fort William).—School and teachers' room (3,000l.); Mr. James G. Falconer, architect, 4, Cameron-place, Fort William.

Bodmin.—Children's home; Mr. J. Pethybridge, Clerk, Board of Guardians, Bodmin, Cornwall.

Bradley.—Fifty-two houses, Bradley Lodge, for the Bradley Lodge Estate, Ltd.

Bridlington.—Workhouse laundry (500l.); Mr. T. Martindale, builder, St. George's-avenue, Bridlington.

Brighouse.—Police station and court (3,000l.); Mr. T. G. Carpenter, County Hall, Wakefield.

Bromley.—Various buildings (9,000l.); Mr. E. Haselhurst, Clerk, Board of Guardians, Bromley.

Brunsford.—Thirty-six houses, Lodge Farm (11,135l.); Mr. G. H. Pickles, Surveyor, Burnley Town Council.

Burton-on-Trent.—Receiving home; architect, care of Mr. G. F. Chamberlain, Clerk, Board of Guardians, Burton-on-Trent.

* See also our list of Competitions, Contracts, etc., on another page.

Butterknowle.—School; Mr. W. Rushworth, architect, Shire Hall, Durham; Mr. T. Manners, builder, Peel-street, Bishop Auckland.

Capelulo.—School (3,000l.); Mr. R. L. Jones, architect, Market Place, Carnarvon. Castle Combe.—Additions to school (2,000l.); Mr. J. G. Powell, County Surveyor, Trowbridge.

Catchgate (Durham).—Houses; Mr. T. J. Trowsdale, Surveyor, Annfield Plain Urban District Council. Christchurch (Hants).—Laundry at work house (1,800l.); architect, care of Mr. Alan Druitt, Clerk, Board of Guardians, Christchurch.

Claydon.—Laying-out of Alderdale Hall Estate (about 2,000 houses); Alderdale Estate Company, Ltd.

Conisborough.—Swimming baths; Surveyor, Conisborough Parish Council.

Coventry.—Motor works for Triumph Cycle Company, Priory-street; Mr. F. R. I. Meakin, Warwick-row, Coventry.

Crocket Ford.—School (3,000l.); Messrs. Barber & Bowie, architects, 53, Buccleugh-street, Dumfries.

Dalmarnock.—Congregational church (2,000l.); Mr. J. C. McKeller, Davidson, & Gunn, 45, West Nile-street, Glasgow.

Darlington.—School (3,000l.); Mr. G. Winter, Borough Surveyor, Town Hall, Darlington.

Darnley (Renfrewshire).—Additions to hospital (2,000l.); Messrs. McWhannel, Rogerson, & Reid, architects, 55, West Regent-street, Glasgow.

Devizes.—Cottage hospital; Mr. A. J. Randall, architect, Vine-street, Devizes.

Doncaster.—Sixty houses, Warnworth, and fifty houses, Carr House and Enfield (about 40,000l.); Mr. F. O. Kirkby, Surveyor, Doncaster Town Council.

Douglas (Isle of Man).—Villa Marina (15,025l.); Mr. D. Rhodes, builder, Skinnerlane, Leeds.

Droylsden.—Development of Alderdale Estate (about 1,000 houses); Mr. G. W. Laughton, Alderdale Hall, Droylsden.

Dumbarton.—Lodging house, Rink-street (3,000l.); Mr. James Bell, architect, 8, Merry-street, Motherwell.

Dundrum.—Schools (2,000l.); Mr. R. Wallace, St. Mary's-street, Kirkcudbright.

Eccles.—The following plans have been passed:—Office building at Barton Hall Engine Works, Gorton-street, Peel Green, for Messrs. L. Gardner & Sons, Ltd. Alterations to Nos. 294 and 296, Liverpool-road, Patricroft, for Messrs. W. H. Robinson & Sons.

Edinburgh.—Four houses, Mayfield-road (4,000l.); Messrs. Menzies & Cockburn, architects, 33, York-place, Edinburgh.

Ellensmere Port.—School (5,925l.); Messrs. Dryland & Preston, builders, Littleborough.

Elworth (near Sandbach).—Wesleyan church (4,600l.); Messrs. A. Price & Sons, Sandbach.

Erith.—Club and institute, Valley-road. Trustees, Erith Men's Club and Institute.

Erith. Extension at works for the Callander Cable and Construction Company, Ltd.

Exeter.—Laundry at workhouse; Mr. R. M. Challice, architect, Bedford-circus, Exeter.

Falkirk.—Conversion of Olympia Skating Rink into electric theatre; The Theatre and Entertainment Development Syndicate, Kingway, W.C.

Frome (Somersetshire).—Children's home, Whitewell-road; Mr. W. R. Kent, Clerk, Board of Guardians, Frome.

Glasgow. Extension to Calton Public School (2,500l.); Mr. David Maben, M.W. School Board Offices, 16, Royal Exchange-square, Glasgow. Extensions to Victoria Bakery (2,100l.) for Messrs. McFarlane, Lang, & Co.; Messrs. James Monro & Son, architects, 28, Bath street, Glasgow. Foundry, Finnieston-street (5,550l.); Mr. Charles Henry, 35, Minerva-street, Glasgow. Additions to buildings, Kinning Park (2,200l.), also shops and houses (4,000l.); Messrs. Bruce & Hay, architects, 261, West George-street, Glasgow.

Grangemouth.—Proposed creosote works (4,000l.) for Messrs. W. Christie & Co., The Docks, Grangemouth.

Greenside.—Additions to school (1,850l.); Mr. Gavin Paterson, architect, 6, Cadzow-street, Hamilton.

Hampreston.—School (3,000l.); Mr. J. Fletcher, Shire Hall, Dorchester.

Hanley.—Sunday school, Trinity-street (1,350l.); Mr. H. W. Shaw, architect, Hanley; Messrs. George Ellis & Sons, builders, High-street, Hanley.

Harrow.—Pavilion; Mr. J. P. Bennetts, Surveyor, Harrow Urban District Council.

Haslemere.—Fifty houses; Mr. A. M. Brownrigg, Haslemere, and Mr. Raymond Unwin, Vetchwood, joint architects.

Houghton-le-Spring.—Drill hall (3,000l.); Mr. H. Chapman, 38, Grainger-street, Newcastle.

Howdon House (Lincs).—Garage, etc. (1,250l.); Mr. J. Dixon-Spinn, architect, 19, Hanover-square, W.

Hursley (near Winchester).—Eight cottages, Hursley Estate, near Winchester (2,250l.); Messrs. J. Nicholl & Co., builders, Southampton.

Hurst.—Sunday school, Ormonde-street; Architect, care of the Primitive Methodist Trustees.

Hyde.—Alterations and extensions to St. George's Church Endowed School; the Managers.

Kilmarnock.—Additions to infirmary (10,000l.); Messrs. John Burnett & Son, architects, 234, St. Vincent-street, Glasgow.

King's Lynn.—Works (20,000l.) for Messrs. Orton & Spooner, Engineers, Burton-on-Trent.

Kirkintilloch.—Church (14,000l.); Mr. George Bell, 212, St. Vincent-street, Glasgow.

Leicester.—School (6,000l.); Mr. T. Groves, Secretary, Education Committee, Leicester Town Council.

Lickey (Worcestershire).—Sanatorium (7,000l.); Messrs. Martin & Martin, architects, Colmore-row, Birmingham; Messrs. T. Lowe & Son, builders, Cambridge-street, Birmingham.

Limbury (Bedfordshire).—School (4,000l.); Messrs. Gotch & Saunders, architects, Market-street, Kettering.

Little Bytham (Lincs).—Workmen's houses; Mr. T. Lake, Surveyor, Bourne Rural District Council.

Little Mill.—School (2,000l.); Mr. W. Bowie, architect, 239, High street, Ayr.

Liverpool.—Artisans' dwellings, Frank-street and Northumberland-street; Messrs. Brown & Packhouse, builders, 54-62, Chatham-street, Liverpool.

Llandudno.—School (6,000l.); Mr. R. L. Jones, Market-place, Carnarvon.

Longside.—Schools (4,000l.); Mr. G. T. Anderson, 1, Crown-terrace, Aberdeen.

Lurgan.—Seventy houses (24,100l.); Surveyor, Lurgan Rural District Council.

Melincroft.—Siloh Mission Hall; Mr. J. Cook Rees, architect, Church-place, Neath; Messrs. Waring, Cole, & Waring, builders, Charles-street, Neath.

Merthyr.—Administrative block, etc. (600l.); Mr. J. C. Rees, architect, St. Mary's-chambers, Neath.

Mitchelstown.—Twelve houses (1,584l.); Mr. J. O'Mahoney, builder, care of the Surveyor, Mitchelstown Rural District Council.

New Luckenham (Norwich).—School (1,200l.); Mr. C. Brown, architect, Cathedral Precincts, Norwich.

Newcastle-on-Tyne. Buildings, corner of Heaton Park-road and Shields-road, for Messrs. F. Bevan & Co. Warehouse and offices (5,000l.); Messrs. Watson & Scott, architects, 48, Dean street, Newcastle.

Newcastle-on-Tyne. Block of offices, Northumberland-street; Mr. H. Gibson, architect, Camden-street, North Shields. Additions to workhouse (18,000l.); Mr. E. Bowman, architect, Westgate-road, Newcastle.

Newton Abbott.—Public swimming baths; Messrs. Rowell, Son, & Locke, architects, Newton Abbott.

Northampton.—Proposed improvements to school, Campbell-square; the Managers. The following plans have been passed:—Six houses, Sandingham-road and Thrusley-road, for Mr. W. C. Throssell; additions to No. 114, Oxford-street, for Mr. J. Holland; additions to factory, Free-school street, for Messrs. J. & G. Rae; eleven houses, Newington-road, and thirty-five houses, Kingsthorpe-grove and St. David's-road, for Mr. A. J. Chown; ten houses, Raymond-road, for Mr. J. W. Gossage; six houses, Southampton-road, and two shops, Wellingborough-road, for Messrs. A. R. & W. School, St. Giles School, and Stimpson-avenue School, for Mr. S. Beattie, Secretary, Education Committee, Northampton Town Council.

Northampton. Additions to premises, Vernon terrace, ten houses, Alton-street, for Mr. J. D. Pullen & Sons; steam bakery, Barry road, for the Northampton Co-operative Society, Ltd.

North Croft.—Church and suite of halls on site of Old Abercrombie Foundry; Mr. T. G. Abercrombie, architect, 1, County-place, Paisley.

Norwich.—Gallery at Museum (1,464l.); Messrs. Gill & Son, builders, Norwich.

Oundle.—Extensions to isolation hospital; Mr. R. E. Wilson, Surveyor, Oundle Rural District Council.

Paisley.—Additions to works, Violet-street, for Messrs. Edie Bros. & Co., Ltd.

Penwortham.—Institute (1,000l.); Vicar, St. Leonard's Church, Institute (700l.); Vicar, St. Mary's Church.

Perry Barr (near Birmingham).—School (6,000l.); Mr. Hutchings, Education Offices, Stafford.

Plymouth.—Additions to Throat and Ear Hospital (2,000l.); Messrs. Thornley & Rooks, architects, The Crescent, Plymouth. Proposed conversion of Beaumont House into swimming baths; Mr. J. Paton, Borough Surveyor, Plymouth Town Council.

Pontefract.—Block of dwellings (5,000l.); Mr. W. J. Tennant, architect, Ropergate-chambers, Pontefract.

Port Glasgow.—Parish church halls, Port Glasgow Bay Area (2,000l.); Mr. A. F. Duncan, architect, Glasgow; Messrs. Peter McBride & Co., builders, Chapel-lane, Port Glasgow.

Portobello.—Five houses, Brunstone-road (4,000l.); Mr. E. Colvert, 16, North-street, Dund-street, Edinburgh.

Preston.—Grammar school (16,500l.); Messrs. Woolfall & Eccles, architects, Liverpool; Messrs. Thomas Croft & Sons, builders, Green Bank Stone Yard, Victoria-street, Preston.

Reading.—Catholic school, Abbey Ruins, Rev. Canon Scoles, The Presbytery, Basingstoke.

Ribchester.—Alterations to workhouse (5,100l.); Mr. J. Clarke, Clerk, Board of Guardians, Preston.

Rosemount.—Construction of swimming bath at school (3,900l.); Aberdeen School Board.

Scunthorpe (Lincs).—Mission hall (3,000l.); Messrs. George Baines & Co., architects, 5, Clement's Inn, Strand, W.C.

Shankhill (Co. Dublin).—Carnegie Library (356l.); Mr. George Bower, builder, Ballybrack.

Southampton.—Proposed school, Shirley (1,200 places); Mr. J. Cruickshank, Secretary, Education Committee, Southampton Town Council. The following plans have been passed:—Mission hall, King-street, for Messrs. Mitchell, Son, & Gutteridge, warehouse, Brinton's-terrace, for Mr. W. A. Kneller; five houses, Empress, Oumdruman, and Handel-roads, for Mr. F. W. Young; four houses, Nile-road, for Messrs. Lemon & Bizard; six houses, Amphill-road, for Mackintosh Bros.; additions, Normanhurst, Hulse-road, for Mr. W. B. Hill; office, stores, etc., Belvedere-road, for Messrs. Weston & Burnett. The following plans have been lodged:—Ten houses, Westbourne-crescent, for Mr. J. Smith; alterations to building adjoining the Bristol Hotel, Terminus-terrace, for Messrs. Emanuel & Emanuel; four houses, St. James'-road, for Mr. J. V. Blake; alterations to Philharmonie Hall, Above Bar-street, for Messrs. Goodwyn & Sons.

Southend.—Parish hall; Trustees, Roman Catholic Church, Southchurch-road, Southend.

South Moor.—Parochial hall and church in situate (1,800l.); Mr. E. Dyson, builder, Pelton.

South Shields.—Schools, Stanhope-road (3,500l.); Mr. Page, architect, King-street, South Shields; Mr. J. L. Miller, builder, North Shields.

St. Andrews (Fifehire).—Drill hall for Burgh School (2,000l.); Mr. David Henry, architect, Church-square, St. Andrews.

Stanley.—Club; Architect, care of the Secretary, Excelsior Club, Greenland.

St. Mary Gray.—Extensions at mills for Messrs. Joyson.

Taunton.—Additions to school (5,800l.); Mr. W. Roberts, Hammett street, Taunton.

Messrs. W. Potter & Sons, builders, Row Barton, Taunton.

Ton Law.—Alterations to foundry for Messrs. Bond.

Tranent.—School, Ormiston-road (5,000l.); Mr. Peter Whitecross, architect, Wine-street, Devizes.

Troon.—Villa, Bentinok Drive (1,700l.) for Dr. Sican, Troon.

Twickenham.—A plan has been passed for a picture theatre, Richmond-road, for The Estate Land and Houses, Ltd., 83, Westcott Park, Hornsey, N.

Weymouth. School (3,000l.); Mr. J. A. McGregor, architect, King-street, Castle Douglas.

Uddington.—Laundry, manual workshop etc. (2,250l.), for the Bothwell School Board.

Wallsend.—Two cemetery churches (5,000l.); Mr. E. Cratney, architect, Station-road, Wallsend. Institute (2,000l.); Messrs. White & Stephenson, architects, 69, Grey-street, Newcastle.

Wareham.—Drill hall and offices; Messrs. Fletcher, Son, & Brett, The Chantry, Wimborne.

Warrington.—A plan has been passed for Messrs. Rylands Bros., Ltd., for new building, Algernon street.

Waterfoot (Rawtenstall).—Extensions to Glove Works for the Newchurch Boot Company.

Wem.—Alterations and extensions to the Conservative Club; architect, care of the Secretary.

Wyke Colliery (Warwick).—School (5,600l.); Mr. J. Willmott, 6, Waterloo-road, Birmingham.

Wylan.—Miners' hall and institute; Messrs. W. Dixon & Son, Biggmarket, Newcastle.

Yaxley.—Parish hall; Surveyor, Yaxley Parish Council.

York. Children's home at workhouse (1,500l.); Mr. J. H. Morton, architect, North Eastern Bank-chambers, South Shields.

ARCHITECTS AND GARDENS.

We quote the following from an article in *Field*:—"When the architect is asked to limit an architectural enormity—to compare, say, the tower of a Highland granite castle with the timbers of Shropshire or olean brick—then he is plainly right in saying to build what he is asked to build. And so in lesser difficulties; he may very easily bring his client to reason by pointing out that his proposition is comparable with others more easily understood by the layman with wearing a straw hat with a frock coat, perhaps. And his client, if he would think matter out, might remember that the architect's reputation has to stand or fall in connection with the house, as his fellow-architects will see it when it is built. He ought, when he has selected his architect, to give him as free a hand as he would give the artist whom he commissioned to paint a portrait or the sculptor who has undertaken a statue. The architect who means to devote the remainder of a lifetime to thinking out the design of a house it is just as important to know that he can work free and unfettered as it would be to a poet or essayist engaged in composition. The architect can no more readily embody the conception of another brain than his own design than the poet or prose writer can undertake to employ a particular metaphor about a particular thing in a particular context."

So much for the building of the house. But the planning of the garden is a little different. The man who has set out on the client business of watching an architect build a house may possibly one fine day find himself in an unexpected and rather awkward position. He may have delivered the whole of the building of the house into the architect's hands, and may have consoled himself with the reflection that his own turn will come with the planning of the garden (matter to which, perhaps, he has given some study), and he may then possibly discover that the architect has taken it for granted that the designing of the garden will go with the designing of the house. He may find this as disquieting as it is at first surprising; but if once more he thinks the matter out he will see that—up to a point—the architect is right on his side. A house of a certain design clearly ought to be set in certain surroundings. In most cases it would be difficult to imagine that the setting of the house could not be bettered by the experience of an architect, while in some cases his help may be even imperative. In the designing of flights of steps, for instance, or the arrangement of terraces demanding stonework or brick building, the amateur can only trust to his architect to save him from incongruity or worse. But the question then arises. Is there not a point to which the architect may fairly be confined? Apart from any question of expense, which in the designing of elaborate terraces, paving, or flights of steps may be very considerable, may not the client justly decide that there is a point at which the garden ceases to be the architect's property, so to speak, and becomes the property of its owner? If there is not, he may well ask. Will the architect pay the bills for the planting of the house and the wages of the staff needed to keep up the garden?

A.A. Silver Medal: Design for a Concert Hall. Site Plan.

Somewhere in that question, in reality, lies the answer to the problem. Apart from any considerations of etiquette, or of a desire on the part of the client to give the artistic expression of his architect free play, the first point to be settled is how much the client is prepared to pay to get the kind of setting which the architect desires. That is a simple matter which can be decided at once by the length of purse-strings, and need not wait any more arguing. But the next point is equally important, and it is one which the architect for his part will do well to realise. It is that, whatever be the initial design of the garden, it will eventually be the expression of the taste of its owner, and not of the architect. If, for instance, the owner of the garden is interested in rock plants, or in flowering shrubs, or in growing delicate and difficult plants rather than in obtaining masses of colour, it is no good to give him some other kind of gardening to do, because he will not do it. If he dislikes to have a wide expanse of lawn, with the perpetual necessity of mowing, it is no use designing him hundreds of square yards of grass. If he thinks bedding out the worst possible use to which to put flowers and gardeners, it is no use for the architect to surround the house with formal beds. They will revert; everything will revert to the type of mind of the owner. So that the architect, if he will realise it, should compose his setting, keeping always in mind

the temperament of the gardener with whom he has to deal. As regards expense, it is his business, and a business which he well understands, to see what can best be done with the amount of money at his disposal; he sets the house, then, as simply or as elaborately as he chooses or is able to set it. But outside the immediate setting he will realise that he cannot go. He may think, and he may be right in thinking, that he knows better than the owner of the garden what the garden should be; but since the garden will become in any case what its owner wishes, he will do well not to attempt to touch what he knows he cannot be sure of holding. E. P."

A.A. SILVER MEDAL.

REFERENCE has been made already to the competitive designs for the Silver Medal of the Architectural Association (see issue June 23, p. 778). We now supplement our criticism with illustrations of the drawings by Mr. Wyville Home, which obtained the award. In carrying out the design for the concert hall the author has availed himself of the large site at his disposal, and has assumed that the whole work would be erected to the memory of a national hero. The treatment accordingly is large in scale, the whole site being raised on terraces carried out in a broad and severe manner. The memorial

A.A. Silver Medal: "Design for a Concert Hall in a County Town." Elevation to Place.

By Mr. G. Wyville Home.

Concert Hall: Cross Section.

Concert Hall: Longitudinal Section.

stands axially in front of the hall, while fountains flank it on either side, and a note of colour is introduced by the grass lawns expanded round these features. The hall itself has been treated in a severe academic manner, dignity being striven after by the long, low lines of the building and by the restraint and concentration of ornament and shadow.

LONDON COUNCILS.

Bermondsey.—The tender of Tarmac, Ltd., Wolverhampton, has been accepted at 842l. 10s. for the laying of a 4 ft. macadam roadway in Galleywall-road.

Bethnal Green.—A plan submitted by Messrs. Andrew & Peasgood, on behalf of Messrs. S. Clarke & Co., Ltd., for the creation of an addition to the latter's factory on the north side of Chisenhale-road, has been approved, as has also an application from Mr. L. T. Dunn for consent to the drainage of the proposed vestry at St. Peter's Church, St. Peter-street.

Edmonton.—At the last meeting of the Board of Guardians the committee appointed to report on the question of a female relieving officer was instructed also to report as to the advisability of providing a home in the country for the Board's patients who needed convalescent treatment.

Fulham.—A communication is to be sent to the London County Council drawing attention to the projected sale of the Sullivan Estate, and asking them to consider the desirability of forming a town planning scheme in connexion with the development of the estate. The Council have decided to raise no objection to the line of frontage of three one-story shops proposed to be erected on a portion of the forecourt of 624, Fulham-road, by Mr. J. Codrington, of 17, Doneraile-street, Fulham.

Greenwich.—Instructions have been given to the Borough Engineer to proceed with the work of relaying the woodpaving from the eastern corner of King William-street along the northern side of Nelson-street at an estimated cost of 147l.

Hanwell.—At the last meeting the Urban District Council the Chairman moved "that application be made to the Local Government Board for authority to prepare a town-planning scheme in respect of certain land within the Urban District." This was seconded by Councillor Poole, and approved of. Application is to be made to the Local Government Board for a loan of 600l. for carrying out the work of extending Springfield-road northwards and then westwards to opposite the centre of Conolly-road.

Hendon.—The Surveyor of the Rural District Council has been instructed to put in

hand the work of piping the ditch and forming a footpath in the portion of Marsh-lane Stanmore. Mr. A. W. Elkington, on behalf of Mr. T. Elkington, has lodged plans for eight houses in Canons-lane, Pinner.

Hendon and Uxworth.—The tender of Mr. T. Chapman, at 862l., has been accepted in lieu of that of Messrs. Packer & Co., at 424l., to construct a sewer in Jersey-road. The following plans have been passed:—Messrs. Hamilton, twenty-one houses and shops, Thornbury-road, and six houses, Jersey-road, Osterley; Mr. B. Potter, alterations to the Eagle Whitton-road, Hounslow; George the Fourth, Staines-road, Hounslow; Traveller's Friend Bath-road, Hounslow; and the Queen's Head, Heston. Messrs. Wainey, Coombe, Road, 1 Co., Ltd., alterations to the County Arms Hounslow, and the Duke of York, Hounslow Messrs. Nowell Parr & Kates, public house Kingsley-road, Hounslow; also offices, Northumberland Wharf, Brentford End. Mr. G. S. Valentin, alterations to Electric Empire, High street, Hounslow. Mr. Frank J. Fisher, alterations at the Rose and Crown, Heston North Star, North Hyde; and Hope and Anchor, Sutton. The following plans have been lodged: Messrs. Smees & Houchin, chapel, Staines-road, Hounslow. Messrs. Ashby's Brewery, Ltd., alterations to Jolly Waggoners, Dockwell: North Star, Whitton-road, Hounslow; and Royal Albion, Hibernia-road, Hounslow. Mr. H. R. Peake, Hounslow Hospital, Staines-road, Hounslow.

Hornsey.—The following plans have been passed:—Mr. W. T. Walker, Finsbury square alterations and additions to "Kildermoria", Bishopswood-road, Highgate; Mr. Alex. Perie, six houses, Springcroft-avenue, Muswell Hill; Mr. Henry East, Hornsey, nine houses, Redston-road; Hornsey. Plans for twelve houses in St. James's-lane, Muswell Hill, have been lodged by Messrs. Herbert & Co.

Ilford.—A plan has been passed for Messrs. Higgins & Thomerson, for Mr. W. H. Knox for fourteen houses, Betchworth-road.

Lambeth.—The Public Health Committee, in December, 1905, approved plans for the con-

A.A. Silver Medal: "Design for a Concert Hall in a County Town."

Awarded to Mr. G. Wyville House.

tion of an underground convenience at Winton-gate, and accepted the tender of Mrs. Spencer, Santo, & Co., to carry out work at a cost of 2,595l. After this had been done it was found necessary to obtain formal approval of the London County Council to the construction of this convenience, the site formed part of Kennington Park, as the London County Council refused to do so, as they insisted on two free water-closets each sex being provided instead of one, the latter supplied by the Council. As no agreement could be come to it was decided to construct the convenience under a site opposite "The Horns" Tavern. The Committee now met that, owing to the strong representations which had been made to them as to the necessity for an underground convenience at Winton-gate, they had instructed the Engineer to interview the officers of the London County Council and explain fully to them the reasons for the Borough Council's inability to agree with the County Council's plan of providing two free water-closets each sex. As a result the Parks and Open Spaces Committee of the County Council stated that they would depart from their usual practice and would be prepared to recommend the Borough Council to grant permission to the Borough Council to construct the proposed convenience subject to protective conditions. Under these circumstances the Borough Council agreed to proceed with the work and to the fresh tenders.

The Council have decided to grant use of the Town Hall at a charge of 1s. 6d. to Mr. D. Freeman, 438, Lea Bridge-road, Leyton, for the purpose of holding a concert in aid of the funds for building the Welsh Institute in connexion with the Town Parish Church. The following plans have been passed:—Mr. H. G. Needham, seven seats, Drayton-road; Mr. E. F. Selby, five houses, Hainault-road; Mr. A. E. Elger, three houses, Colchester-road; Mr. C. E. Read, addition to nurses' home, Chertsey-road; Mr. A. Radcliffe, five houses, Bald-road. A plan has been lodged by Mrs. J. Greenwood, Ltd., for additions and alterations to the "Hare and Hounds" public-house, Lea Bridge-road.

London.—The Finance Committee of the City of London Guardians report having considered plans and specifications of the Architect A. E. Pridmore and the Consulting Engineer (Mr. E. R. Dolly) for adapting the old Bow premises as a Metropolitan Poor Relief Hospital, at an estimated cost of 11,150l. 10s. for the Architect's scheme, and 3,000l. (the Engineer's scheme), and had come to a conclusion that application should be made to the Local Government Board for consent to the scheme, inviting tenders from selected firms instead of advertising for sealed tenders. It was also decided to enter into contracts (1) Mr. E. R. Dolly, to supervise the engineering scheme at a fee of 250 guineas, extras of any kind to be paid, and (2) with A. E. Pridmore, to supervise the building work at a fee of five per cent. on the certified amount of work done on completion of the scheme, and to pay him the sum of guineas for plans and schemes submitted not carried out.

London.—It is proposed to carry out repairs to the works in the borough during the latter ending December 31 next, at an approximate cost of 3,525l. A plan has been lodged for Messrs. Humphreys, Ltd., for a hall 6, East India Dock-road.

Walthamstow.—The tender of Messrs. Galbraith & Co., Ltd., Camberwell Green, S.E., has been accepted at 310l. for providing and laying a pottery floor over the pond of the first-class swimming-bath at the Hoxton Baths.

Southwark.—The tender of Messrs. Jennings & Co., Ltd., at 2,240l. has been accepted for carrying out the second section of Avenue-road, the carrying out of improvement works in Avenue-lane the tender of Messrs. W. & C. Nichol, at 2,350l., has been accepted. Plans submitted by the Surveyor have been approved making up the following private streets:—Avenue-lane, Bowes Park; Burford-gardens, Messrs Green; and Elm Park-road, Winch Hill; as have also plans for making up the unmade and unopened section of Elm-gardens. The following plans have been passed:—Messrs. Edmonsons, Ltd., eight seats, Arundel and Hoppers roads, Winch Hill; Messrs. W. A. Goring, twenty-two houses, Fox-lane, and Bourne-hill, Messrs Green; Mr. W. C. Jones, alterations to the lodge of the Skippers' houses, Green-lane, Palmers Green; Mr. C. Hill, nine houses, Oakthorpe-road, Messrs Green; Mr. W. J. Ward, five houses, Green-lane, Palmers Green.

Walthamstow.—The Hospital Committee have accepted the tender of Messrs. C. Mott on, Ltd., Staines, at 368l., for roadmaking. *Electricity*—Electricity mains are to be added in Buckle-street, Artichoke-hill, Under-street, and Sly-street.

Walthamstow.—Plans, specifications, etc., have been approved for making up part of Evesham-avenue, and notices are to be served upon the owners of premises in such streets to carry out the work. The Engineer submitted a plan for making up a portion of Brestenham-road at an approximate cost of 600l., and it has been decided to instruct the Surveyor to carry out the work, upon the Law Land Building Department, Ltd., depositing with the Council the estimated cost of the work, any difference between the estimated and the actual cost to be paid by, or refunded to, the owners. The Surveyor has further been instructed to lay Trinidad asphalt macadam in parts of High-street and Wood-street. Plans submitted by the Engineer have been approved for the laying out of the Salisbury Hall Estate. The following plans have been passed:—Mr. J. Dunn, 112 houses, Elphinstone-road; Mr. A. G. Barton, warehouse and workshop, Hale End-road; Mr. T. H. Gaskin, thirty-five houses, Oak Hill-gardens; Messrs. Carter, Paterson, & Co., Ltd., alterations to premises, Wood-street; Mr. J. E. Ashby, laboratory, Blackhorse-lane; Messrs. F. Boreham, Son, & Gladding, theatre, St. James-street; Messrs. Hoare & Wheeler, church, Selwyn-avenue; The Stratford Co-operative Society, branch, dairy and depot, Hoe-street. Plans have been lodged as follows:—Mr. W. T. Streather, twelve houses, Chingford-road; Mr. T. Baker, six shops, The Broadway, Winchester-road; Messrs. E. Hawkins & Co., Ltd., theatre, Wood-street.

Wandsworth.—The following plans have been passed:—Mr. J. J. Taylor, garage and offices at Streatham-hill; Mr. H. S. Lee, additions to bottled beer stores, Ram Brewery, High-street; Messrs. Rowley Bros., erection of tramway sheds, Streatham-hill; Messrs. W. H. Lordon & Son, re-erection of Railway Bell-beehouse, Mitcham-road, Tooting.

Watford.—At the last meeting of the Rural District Council, plans submitted by the Surveyor were approved for an extension of the sewer at Nash Mills for some 800 ft. at an estimated cost of 157l. Plans have been lodged by Mrs. Ackerman for three houses at Chorleywood.

OBITUARY.

Mr. W. W. Wroth.

The death, on September 26, is announced of Mr. Warwick William Wroth, F.S.A., Senior Assistant Keeper in the Department of Coins and Medals, British Museum. Mr. Wroth was a son of the late Rev. W. R. Wroth, Vicar of St. Philip's, Clerkenwell. In 1903-6 he brought out catalogues of the Greek coins and of the Imperial Byzantine coins in the national collection. He contributed a large number of articles to the "Dictionary of National Biography," including the two supplements, from the commencement of that undertaking more than twenty-five years ago, and with the assistance of his brother, Mr. E. A. Wroth, he published in 1896 a valuable work, entitled "London Pleasure Grounds," that embodies the results of painstaking research in many neglected or forgotten sources of information.

Mr. R. Morton, M.Inst.C.E.

The late Mr. Robert Morton, a native of Fife, was educated in Scotland as an engineer, and became manager of the London Gas Company's works at Nine Elms; he held that post until the amalgamation in 1883 with the Gas Light and Coke Company. He was a director of the South Suburban Gas and other companies, and for a long period of the South Metropolitan Gas Company, of which he was afterwards Chairman, succeeding Sir George Livesey, with whose schemes for the men's co-partnership and the abolition of Sunday labour in gasworks he was closely associated.

FOREIGN AND COLONIAL.

Rand Art Gallery.

So far as can be gathered, the trouble over the building of Johannesburg's Art Gallery is by no means ended. The matter will come before the Johannesburg Town Council again at no distant date, and the debate it is said will be extremely interesting. Some months ago a big controversy waged around the question whether Mr. Lutyens, the eminent English architect, should design the building, or whether there should be open competition among the architects of South Africa. The Council decided to entrust the work to Mr. Lutyens. Prior to this the sum of 20,000l. had been voted for the erection of the gallery, and a site in Joubert Park was agreed upon. The design of Mr. Lutyens has now been submitted to the Council, and it has been stated that if adopted, and the buildings carried out in stone, the cost will be considerably in excess of the sum sanctioned by the Council, and will, it is estimated, be at least 75,000l.

Fireproof Building, Russia (Poland).

The following information is from the report by H.M. Consul at Warsaw (Mr. C. Clive Bayley) on the trade of Poland and Grodno in 1910, which will shortly be issued:—

The houses built for the occupation of the richer classes are all on the flat system, while those for the poorer classes are similar to the British model dwellings, only perhaps a little more ornate. All buildings are supervised by a large committee of engineers and architects appointed by the municipality, and generally the construction is strong and good. Fireproof buildings are the fashion, and all fireproof materials are in demand. Reinforced concrete floors, staircases, and partitions are being slowly adopted, but at present hollow bricks are principally used for floors and partitions. The external finish of the houses is much less ornate than formerly, but the internal fittings—door handles, hinges, locks, window fittings, etc.—are much superior to those previously used, and consequently should attract the attention of the British manufacturer.

Emigration to Canada.

It is getting too late in the season for emigrants to start now, and those who go should be prepared to keep themselves during the winter if necessary. The building strike at Vancouver, British Columbia, is settled.

Emigration to Australia.

In Sydney and suburbs the building and iron trades have been fairly well employed, brick-makers being especially busy. The ironworkers at Lithgow have been on strike. In Victoria there has been plenty of work for mechanics, such as builders, carpenters, bricklayers, ironworkers, and boiler-makers. Work of nearly all kinds is plentiful in South Australia, and there is a good demand for bricklayers, masons, cabinet makers, carpenters, plasterers, plumbers, and ironworkers. In Queensland there is plenty of employment for most classes of labour, such as men in the building trades, plumbers, fitters, etc. But the same time there have been some labour troubles, the gasworkers at Brisbane and some railway navvies in the north having struck work. In Western Australia there is a good opening for carpenters and plumbers. Tasmania shows little demand for more mechanics or labourers.

SELECTED PATENTS.

10,256 of 1910.—Edwin Dransfield and William Rigby, of the firm of Rigby & Mellor: Shaft tops and ventilators.

This relates to shaft-tops and ventilators, which are constructed so that the foul air is conducted into an upper chamber and is induced out to the atmosphere in a downward direction. In the shaft-top shown, foul air passes from the chamber *a* to the upper chamber *b* by way of short vertical tubes *c*, and is induced out of the aperture *d* on to the flat roof of the lower chamber by the wind blowing in the space between the chamber.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

A similar construction is adopted in the ridge-roof ventilator shown, the draught in ducts *a* arranged on the roof induces the foul air out of the upper chamber *b* through apertures *d*.

10,778 of 1910.—Flora Williams Smith: Ladders.

This relates to folding ladders having the steps in two sections pivoted together and to channel-section ladder sides, and consists in providing struts pivoted to the ladder sides and to the steps. The struts *a*, *a'*, for the top and bottom steps each consist of two parts *x*, *x'*, pivoted respectively to the step and ladder side, one part being slotted, and the other being provided with a stud *x''*, which slides in and engages a notch at the end of the slot. The ladder may be provided with back legs of angle section to form a step-ladder, the back legs being connected together by pivoted divided straps *b*, *b'*, secured against collapse by pivoted struts *b''*, *b'''*, constructed similarly to the struts *a*, *a'*. The spread of the step-ladder is limited by stays *C*, which may be

10,778 of 1910.

extensible or consist of two parts hinged together and pivoted to the ladder and back legs.

11,167 of 1910.—Nicolai Frederik Mohl: Moulding concrete chimneys, etc.

This relates to reinforced concrete chimneys, columns, towers, or masts, which are formed tapering and with a non-circular section, by moulds consisting of four segments, which are either cylindrical or cylindrical sections, combined with straight portions, the radius *r* of the cylindrical portions being in all cases less than the radius *R* of a circumscribing cylinder. Each segment of the mould consists of ring portions *p*, *q*, of angle-iron slidably adjustable on each other, and carrying boards *o* and *s'* respectively. The boards *s'* are removed one at a time as the mould is raised, the mould

11,167 of 1910.

becoming circular at the top of the chimney. In the other mould the removable boards are carried by the straight portions *G*, *H*, which are allowed to project as the mould is diminished in size. Internal moulds, when such are used, may be made similarly to the external moulds, or constructed of wood, the mould being diminished in size by sawing off the straight portions. The mould segments are secured together by binding-wires or hinges.

11,228 of 1910.—William Herbst: Floors.

This relates to floors of the type described in Specification No. 10,215/09, wherein the ceiling slabs *c* are supported by the joists instead of by the intermediate cross-pieces *b*,

11,228 of 1910.

10,256 of 1910.

and the joists between the ceiling slabs are situated under the cross-pieces. The slabs *c* rest on the flanges of the joists, or are suspended therefrom by metal bars, and secured by a layer of concrete.

11,237 of 1910.—André Weill: Moulding tiles.

This relates to means for inverting the mould as it is moved towards or from the moulding-table in apparatus for moulding vitreous ceramic facing-tiles, in which the upper surface of the fluid mass forms the face of the tile. This is effected by means of a rack 18 on the machine frame, and a toothed section 19 on the hinged mould 9. The fluid mass is placed on a die 21 surrounded by a frame 22, carried by a spring-supported moulding-table 10, and on operating a lever 8, the hinged mould 9, carrying a plate 24 for forming the face of the tile, is turned over by the engagement of the section 19 and rack 18, and is forced down into contact with the frame 22. The frame 22 is thereby depressed, and the die 21 remaining stationary, the fluid mass is forced into the mould 9 when the moulding is effected. The mould 9 is raised, and on reaching the end of its stroke is again inverted by the engagement of the section 19 and rack 18.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Promoted Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday, [N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner, and we cannot publish announcements of tenders accepted unless the amount of the tender is stated, and the lowest tender is under 1000, unless in some exceptional cases and for special reasons.]

DECORATIVE MATERIALS.

TRADITION rightly assigns to the various recognised types of architecture certain qualities of surface tone and texture. These originally developed in conjunction with the forms defining the characteristics of style. Thus a material capable of being treated with delicacy and intricate detail induced the worker to adopt these qualities in his work, while if it was not he sought his effects in another way.

Nowadays the process is in a great measure reversed; the architect determines his form of treatment first, and afterwards selects the most suitable material. The wide freedom of choice

now open to the designer has its dangers; we see too often the ill result of injudicious selection—a fault that could hardly arise when architecture owed its form of expression to the more limited range of materials available. Another mistake, less common than the use of inappropriate form, but still to be observed in modern work, is the adoption of a surface finish that either detracts from the proportionate value to be given to pure form, or may not display the essential quality of the material used. For example, a marble statue if given the maximum possible polish will show sharp lights and a lack of gradation rendering it impossible

to appreciate the delicate subtleties of form it should exhibit, while a slab of marble selected for its beauty of figure may demand a high degree of polish to secure its due effect. This problem occurs throughout the range of materials used for architectural purposes, and it will generally be found that if the finish bringing out to the utmost the beauties of the material is such as will detract from those of the design, then the material is not the one that should be employed.

Though, of course, all materials can be counted as having decorative value in their proper place, in our climate the interior is usually regarded as offering

opportunities for the employment of those more specifically decorative in their colours and texture. With us it is rare to find a complex scheme of varied materials used externally, and rarer still to find such a scheme successfully carried out.

Most of our finest buildings depend for their effect far more on form and proportion than on the materials used, and the selection of the latter, though, of course, requiring careful consideration, does not entail the series of infinite niceties of perception that may be demanded in the internal treatment of a building of any but the simplest character. It appears, therefore, preferable to devote our attention to those materials that are primarily used for decoration and not for construction, and to their use in internal work.

While it would be going too far to maintain that in constructive features one should not employ highly-decorative material, it may be taken as a general rule that the more emphatic the decorative quality the less suited is the material for work having a structural function. We get a well-recognised example of this in wood panelling, where the framing is of straight grained wood and the panels may be strongly figured.

If we bear this general principle in mind it will help us in deciding where and with what kind of material we shall attempt to enhance our architectural effects. To begin with, if we are aiming at expression by means of pure form, we shall avoid the use of anything distracting the attention from this. Our colouring and texture will be uniform throughout, whether wood, stone, or plaster. Pure form is, however, a severe taskmaster, and can only be acceptable to few minds highly trained in the perception of its subtleties. It is, in its demand on the intellect, almost too exalted for the companionship of everyday life, and therefore for the sake of easy and pleasant variety we bring in wood, metal, marble, glass, wallpaper, and the numerous materials that attract the eye by their qualities of colour and texture.

Taking first materials that are more or less uniform in colour, we see a very wide range in effect due to their characteristics of surface—the differences due to varying degrees of polish are too obvious to demand attention—but even with matt surfaces it is too frequently assumed that the colour appears uniform. Now, this is never the case. Take, for example, a room distempered or painted a perfectly uniform tint and examine it carefully; you will find that the room is a rough sort of camera-obscura, and that the objects outside influence the colour of the various portions of the wall. Thus a grass lawn will tint all the upper part of the walls green, while the lower portion may reflect the colour of a bluish sky; let a mass of white cloud pass across, and the wall opposite will whiten at once; while a fall of snow on the lawn will alter the colour scheme almost beyond recognition. So much for the uniform tint, which but for such influences as these would be almost unbearable.

Take your flatted wall and finish it with enamel, the response to the external influences quoted above is entirely changed; face with marble having but a trifling measure of translucency, and it

will be changed again; thus we have one set of variations to which we can now proceed to add those of colour—colour, either uniform, which will enter into combination with the influences previously enumerated, or colour in such materials as wood and marble, which is never uniform, and thus superimposes yet another set of effects.

Through these stages we pass to the adoption of figured materials, which can be employed either to produce a sort of informal pattern or to concentrate the interest at certain points much in the same way as one would use enrichment or sculpture. As a type of the former we may call to mind the marble wall linings of St. Mark's, opened out like a veneer to give wavy chevrons or vase-shaped outlines. The other alternative may be seen in the bosses or roundels frequently employed by the artists of the Cinquecento, while it forms the logical reason for the employment of richly-figured marbles in columns and pilasters, which one might have assumed should conform to the rule as regards the simplicity of structural forms. Indeed they do conform up to a certain point, for it will be recognised that, if the stability of a considerable mass depends on the column, too variegated a material gives an impression of weakness; it is only where the apparent need for support is comparatively slight that the column becomes an appropriate feature to attract the eye by the emphasis of colour patterns and contrasts. The wall of the basilica church rising sheer above its range of columns demands strength and simplicity in them, while the gilded scrolls and airy flowing lines of the baroque seem poised so lightly that the most variegated marble will carry them.

In quoting such examples as these let it not be imagined that we deem it feasible to lay down a series of rules by the application of which it is possible to decide the conditions appropriate for the use of this or that material; such decisions can only be safely formed after long cultivation of the artistic faculty. In this, as in most other artistic problems, a rule is only safe in the hands of one who is past needing it.

Notwithstanding this, we are entitled to add a few warnings on some of the pitfalls before the decorator in the handling of varied materials. It is safer to keep to as few kinds of material as possible, and to combine only those that suggest a certain harmony in their qualities. For instance, marble and smooth plaster can be combined by the skilled designer, or marble and glass mosaic, but marble and wood or mosaic and wood need most careful differentiation of function if they must be used together—any suggestion of wood supporting marble or mosaic is fatal. The wall linings and stalls of the great Gothic cathedrals show how wood-work can stand inside the actual structure; the wood panelling to a modern bank with marble ashlar above it gives quite a different impression. Still more objectionable is the combination of marble or other enduring material with such obviously ephemeral surface coverings as embossed papers or decorated linens.

It is not necessary that decoration should express the quality of permanence,

but its expression should be consistent throughout, and may range from the dignity of the purely structural, through all the grades of protective coverings, to such temporary forms as tapestry hangings and textile draperies.

ARCHÆOLOGY IN INDIA

AT a time when the protection of our ancient monuments at home has become a national question, and when we might have pointed out the procedure of the Government of India as a shining example to us in this respect, Lord Curzon informs us in a letter of protest to the *Times* that the excellent system instituted under his viceroyalty is proposed to be abandoned by the Indian Government for no other apparent reason than that of securing a trifling reduction in expenditure. In Lord Curzon's own words:—

"In 1901 the Secretary of State accepted the proposals which we had submitted to him in 1900. We did not seek to abolish the responsibility of the Local Governments for the execution of the local work of conservation and repair, because they were the legitimate and inevitable agents through whom this must be done. But we sought to encourage and assist them in the proper discharge of this duty by grants in aid, amounting to one lakh (6,666) a year, and by the appointment of a highly trained and competent archaeologist to exercise a general supervision over the archaeological work of the entire country, to keep in touch with the Provincial Governments, to give advice to their officers, and to secure the prosecution of a sound and consistent policy. We were most fortunate in procuring the services of Mr. J. H. Marshall, who had served a valuable apprenticeship in Greece and Crete and who brought to the discharge of his duties a scholarship and enthusiasm which have reanimated the entire sphere of Indian archaeology and a tact which has kept his relations with the Local Government free from the smallest symptom of friction.

Let me describe in a few sentences what he has assisted the Government of India to do. During the past ten years there is not a group of famous buildings or remains in India—I may almost say not a single structure—which has not been examined and taken in hand. Surveys, drawings, illustrations, and photographs have been made or remade of the monuments in all parts of India. Lists of remains have been collated, corrected, and published, and local museums have been started in every important centre of archaeological discovery of architecture.

And now it is proposed, not, of course, to bring all this beneficent work to a close—for no sane person could dream of such an outrage—but to deprive it of the trained supervision of the officer and the Department to whom it is mainly indebted for its success. It is proposed once more to revert to the Provincial system which has been tried and found wanting.

In case it should be argued that so excellent has been the work of Mr. Marshall and his staff that India can now afford to dispense with their services, and that the Local Governments, redeemed from their former apathy, can safely be left to act alone, I answer that with every allowance for the changed spirit that prevails, and for the zeal of individual Governors, this cannot be attempted without certain disaster. In the first place, not one quarter of the work is yet done. Secondly, Local Governments have not got the men upon their establishment (it is not their fault) even if they have the zeal and the funds. The archaeologist is not born, but made; and he can only be made in India, not by the experience of building hospitals or bridges, or even by studying Sanscrit and deciphering inscriptions, but by careful education in the principles of conservation and research."

As an example of the type of museum referred to by Lord Curzon, we give this week an illustration of an article on the Museum at Muttra in the N.W. Provinces.

of greater importance than collections, as these is the proper supervision of great architectural remains representing so many epochs and so many civilisations. It is almost impossible adequately to realise the enormous number of important and representative buildings that are scattered throughout India and their exceptional value to the artist and the student. Surely it would be an eternal disgrace to us if having once made an effort to put these under intelligent supervision, we should take the retrograde step now contemplated.

Every architect must have realised the extraordinary impression that the architecture of India has made on all who have studied it. Apart from more recent researches, many of which have been summarised in our columns, we have only to run through the pages of Ruskin to grasp the importance of these works in the history of the world's architecture; how one influence has succeeded another from the days of the Pagan incursion onwards, its story being itself a microcosm of the influence of racial interactions on the arts. Now that we are beginning to realise the value of such studies, no less for the architect than for the general student, to find such an authoritative body as the Indian Government displaying a disregard of the necessity for maintaining an adequate system of preservation and record comes as a severe shock, and we can only hope that the protests of the various artistic and archaeological societies now being sympathetically voiced will cause them to reconsider such an ill-advised decision.

NOTES.

The British School at Rome. An architectural journal must not omit to congratulate the British School at Rome—our widely appreciated Consulate of the Arts and classic culture—which commences its second decade this month. Architects especially are aware of the value of the institution, and are likely to increase their regard when those who are members of the recent Congress of Architects, having countered the learning of Dr. Ashby, the director and admittedly the first of living Roman topographers, and the charm of Mrs. Arthur Strong, return and disseminate their reports. The School has been carried on with pitifully inadequate financial support and official encouragement, as regards the home Government, at any rate; for successive Ambassadors and influential people have by their interest shown an attitude of helpfulness in marked contrast to the ineffective outcome of Whitehall. Many architectural students have made it their centre while in Rome and Italy. We know of two who are working there this year, one on the restoration of the Temple of Fortuna at Aletrina, and the other, with the kind assistance of Commendatore Boni, on the Arch of Titus, besides the desultory men who stay for a short time only. One of the great advantages of becoming a student proper of the School is that one may obtain the so difficult *permesso* for the museums and galleries, a freedom which makes a distinctly appreciable difference. The problem of

the interminable and increasing demand for *lira* at the door of every place of interest to students of art is becoming acute. Our Education Office is at work upon it, and we hope the outcome will be satisfactory and soon. The School is not yet residential. But the matter is being taken up, and we shall be surprised if the deliberations of the Royal Academy and the Royal Institute bear no fruit.

Lake Dwellings.

PROFESSOR BOYD DAWKINS in a letter to the *Times* reminds us of the excellent opportunity that the recent dry summer affords us for the discovery and investigation of our lake villages. The water in many of the lakes is now considerably below the normal level, and a careful survey might be productive of valuable results. Professor Dawkins mentions that Munro records 113 lake settlements in Scotland and more than 200 in Ireland, some of the latter having been occupied as late as the XVIIIth century. Only eight, however, have been located in England and Wales, possibly because they have not been looked for. We might suggest that the conditions make research much more difficult in this case, as most of our lake dwellings were probably in flooded marshland which has since been drained and cultivated. Instead, therefore, of merely tracking along the borders of still existing lakes it means probing and excavating in likely positions. Probably there are many sites that will never be discovered, but where a clue is found and excavations are undertaken the results are likely to afford an ample reward to the investigators. The finds at Glastonbury and Mere show that the industrial arts of spinning, weaving, pottery, and glass-making, as well as metal-working in bronze and iron, were well known, while many other details of the life of this period can be realised.

Variations in Quantities.

THE Portsmouth Board of Guardians are evidently perturbed in their minds with reference to the quantities for an extension to the local infirmary. So far as we are able to judge from a report of a recent meeting to consider the question, they appear to have discovered certain minor discrepancies between the contract drawings and those submitted to the Local Government Board, copies of which are held by the Guardians. For some reason which is not explained, this fact seems to have raised doubts as to the quantities. No one appears to know from which set of plans they were taken, though no one brought forward any facts and made any definite suggestion to explain why it was thought that the ordinary procedure had been departed from. The mere fact that discrepancies existed seems to have aroused suspicion. We are not acquainted with the facts or with the exact procedure adopted in this case with regard to the plans for the Local Government Board, but every architect who is worth his salt endeavours to perfect his design in the interests of his clients up to the last moment, with the result that such discrepancies are not unusual, and where the Board is not supplied with facsimile copies of the

contract drawings they are inevitable. Unless the Guardians have more definite information than appears in the report of their meeting it may not be found necessary to call in another quantity surveyor just to convince them that it is a case of much ado about nothing.

The Irish Railway Strike.

THE Amalgamated Society of Railway Servants concluded their Conference by passing a resolution, which, although drawn in somewhat ambiguous terms, appears to countenance the action of the strikers on the Irish railways, in that it "expresses regret that the railwaymen on the Great North of Ireland and the Midland Great Western failed to respond to the call of the executive committee, which was given after many urgent requests on the part of those already on strike, and desires to point out that such inaction on their part was not only responsible for the failure of the men to obtain just terms of settlement, but has resulted in numbers of loyal members being victimised." In view of the claims of this Society to be recognised as an official medium between the railway companies and their servants, it may be well to recall what were the demands put forward by the "loyal members." Their demands were that they should not be called upon to handle goods legally offered to the railway companies, and which the companies were under legal compulsion to forward, and those demands were based upon the fact that some trade dispute was in existence with the firms which offered the goods. The "just terms of settlement" apparently were that all the strikers should be reinstated over the heads of men who had remained faithful to the companies. Further comment on this matter appears superfluous.

Metropolitan Water Supply.

AFTER a time of almost unprecedented drought it is certainly satisfactory to find that the Metropolitan Water Board can report favourably at any rate on the quantity of water available, especially when not only have the sources of supply been necessarily restricted, but the consumption has also increased. At the recent meeting of the Board it was stated that in 1910, during the week of maximum demand, the average daily supply was 261,333,000 gallons, or 37 gallons per head. This year the week of maximum supply averaged daily 300,094,857 gallons, or 42.1 per head. The quality is not so satisfactory, and shows the necessity of the policy of supplying increased storage facilities, which has been adopted by the Board, and which certainly must be pursued until the quality can be maintained, even under such exceptional circumstances as have prevailed this year.

The Infirmary Site, Manchester.

THE battle of the Infirmary site is not yet decided. Since the renewed attack of the advocates for a new exchange in this position the matter has been hotly debated by the Manchester City Council

[Photo, by Alinari.]

Bridge at Gubbio, Umbria.

at three successive meetings, and on Wednesday, by sixty-three votes to fifty-five, the question was referred to a special committee. Possibly the alleged unsatisfactory result of the Library and Art Gallery competition may have affected the voting. While the last thing we should desire would be to attempt to prejudge the assessor's award, it seems clear, from a letter which will be found in our Correspondence column, that some dissatisfaction is felt in regard to the interpretation of an important and binding condition. We are not prepared to endorse our correspondent's views at the present moment, as in fairness to the assessor and competitors our expression of opinion should be reserved till the award is made public, but the question is of so much importance that we feel bound to recognise the desirability of a free discussion of the subject.

THE STORY OF THE BRIDGE.

BY WALTER SHAW SPARROW.

IX.—IN CONCLUSION.

In this set of brief articles on a very big subject my aim has been a simple one, namely, to seek out a few of the most general principles and most useful historic facts which ought to regulate the study of bridges, and to keep away from the routine information given in technical manuals and in encyclopædias. My second purpose was to try to attract the newspaper critics, for it is with their help alone that great questions of art can be brought prominently to the notice of the British public.

When we remember that laymen in this country are the chief patrons of art in all its phases we must own at once that building and architecture belong to the public education of the people, and ought to be so considered by all who write about them; particularly in view of the fact that architecture and buildings are slighted and neglected by all popular newspapers. Sports and games, books, plays, music-halls, even the hobby of "taking" amateur photographs, are all dealt with by the Press in a systematic and thorough manner week by week all the year round; while new houses and new bridges, and the vital national interests represented in buildings of every kind, are passed by in silence, if not with contempt. The reason is one of base trade. Newspapers earn more from the advertisements of King Jerry than they could ever hope to earn by respecting design as an art. While jerry-syndicates are willing to pay 300*l.* for a full-page advertisement in a popular newspaper, no architect and no real craftsman can expect the daily Press to notice good work.

We must teach the public to defend its own interests. That is the only cure. Not one layman in twenty knows that all advertisements of jerryed craftsmanship belong to the cost of production, and not one layman in twenty can read a book on architecture, because very few writers on that subject take pains to be interesting. They appeal to architects, forgetting the great patron of architecture—the British public. I could name many a book on buildings that requires from its readers as much patience and as much pluck as climbers need on a cold and misty day in the Swiss mountains.

When I began to collect photographs of bridges I received volunteer advice from a good many friends, and all of it ran on the same note:—"Don't forget to be very technical in your research. Keep always in mind the practising engineer and the office architect." Such was the burden of the

warnings that came to me unsolicited. As any man with common sense would study the history of bridges from any standpoint except that of social utility. The technique of bridges are to be found in a thousand books and more; you can pick and choose; you can become a mental carpenter in bridge-building, or a mason learned in historical methods, or a theorist on the modern science of engineering. The grammar of construction has a great many teachers old and new. But if you set your heart on the humanity of bridges, their association with the life of succeeding generations, your guide must be your own research, and it will lead you to larger questions of technique than those which are dealt with in the grammar of bridge-building.

It is pretty plain that an inquiry of this kind needs to be fixed by reference to given sets of social circumstances in their relation to given principles that the evolution of society keeps in vogue. There are some common rules as to what is right and best in bridge-building, and their application is not a matter of difficulty if we find their bearing on actual conditions in a definite kind of emergency. For example, it is accepted universally as a fact that ways of communication in a country, whether railways or high roads, are to our industrial civilisation what arteries and veins have been to the human body, the conduits of strength, energy, life; they make development a natural process, half-automatic in action; and when they decay and perish a nation suffers paralysis, locally or entirely. But, as human nature renews herself in her offspring, so in the arterial system of a country, roads and bridges and railways can be made permanent by constant restoration. Only, of course, much forethought must be shown, because we know that the dire crises of war come to all nations, and it is during those crises that bridges and roads are most urgently essential. It is a commanding law

Therefore, that roads and bridges, like the navy and its battleships, must be as fit to counter war as science and art can make them. This principle, rightly understood, is not many thousands of facts in technique, it is the essence of technical method in our practical attitude to bridge-building. If a bridge is more vulnerable than it ought to be, and if it could not easily be mended for traffic after being hit by a shell or badly injured by explosives during a strike; if, in short, it is just a trade experiment in scientific engineering, we need not concern ourselves with its mechanical genius, for such bridges are like the brilliant theories that flare around false premises. The true test of a bridge is the confidence that we can have in it when the country stands most in need of its services. No bridge can be made vulnerable; it is on land what a battleship on the sea, essential alike to peace and war; and it should give the maximum amount of safety that sciences can devise at any period in their co-ordinated evolution. That one principle is a practical guide and an interpreter of what is best to study in the history of bridges. It helps us not only to put order into our criticisms, but to catalogue the accumulations of knowledge, and to see how the techniques of each new type of bridge were influenced by ruling methods of attack and of defence. Nor is it a slight benefit to know what facts in history are worth examination and remembering. The great deal in modern bridges is theoretical, and the interesting and useful thing is, as an engineer said, to know what is needed for the proof of a point, what is wanting in a theory; how a theory hangs together, and what will follow if it be admitted.

Who knows what bridges in reinforced cement may be worth? What answer will we give to that question even from the standpoint of peace and trade? Austria has invested great confidence in cement bridges, and France has made, and is making, many experiments along the same uncertain lines. You will find much to interest you in the *Manuel Théorique et Pratique du Constructeur en Ciment Armé*, by MM. N. D. de Bédesco and V. Forestier.

For the rest, I hope that the illustrations in this set of articles will be useful to many students. They have been chosen with

great care from my collection, and each represents a type. To collect such photographs from all parts of the world is not an easy task; it means much research and it takes a long time. British bridges are not difficult to get at, because we know where they are, but the foreign examples are troublesome. Students will do well to fix their attention on two countries in particular, Spain and France, for the following good reasons:—Spain is very rich in bridges, primitive, Roman, mediæval, and modern; and from the earliest times to the present, moreover, bridge-builders have had the same difficult problems to solve there. Rivers that run dry in summer become raging torrents in winter after storms; the country itself, geographically, presents many and varied problems, from deep and wide valleys to narrow mountain gorges; and we must remember also that social life and trade life have changed less in Spain than elsewhere in Europe, so that there has been as a rule less interference with the historic character of old bridges. Then, as to the best means of getting photographs, Lacoste, of Madrid, has many, and Mansell, of Oxford-street, will obtain from him a general selection from which you can make your choice.

France, too, is very fortunate in having out of doors—and very often in daily use—many bridges dating from remote times. She has been lucky also in having a long record in the administration of her *Ponts et Chaussées*. A great many mistakes have been made since and during the times of Perronet, but these mistakes have some French wit and some French vivacity. Indeed, a book on bridges in France would give, in a simple and direct way, such a history of their evolution as would be most convenient for experts to verify during a long summer's holiday.

I have illustrated and mentioned some of the most typical French bridges, but no harm will be done if I give other very important examples. Here is a list:—

Roman Period.—(1) Pont de Sommières, over the Vidourle, Gard; this will be studied by M. de Dartein in his *Ponts Français Antérieurs au Dix-huitième Siècle*. (2) Ruins of a Roman bridge at Alzet over the Aude. (3) Remains of a Roman aqueduct at Fréjus, Var. (4) Remains of a Roman aqueduct at Luynes, Indre-et-Loire.

(5) Other remains over the Rhône at Lyon. (6) I do not know whether the noble little fortified bridge at St. Chamas still exists; it was there about thirty years ago, and it is a monument to be studied with care. Illustrations do exist and historical documents also.

Gothic Period.—(1) Pont d'Orthez, on the Gave de Pau; fortified. (2) Pont d'Espalion, on the Lot. (3) Bridge over the Orb at Béziers (*Hérault*). (4) Pont St. Martial at Limoges across the Vienne; repaired and remodelled. (5) At Nérac, Lot-et-Garonne, over the Baise. (6) Bridge at Saint-Germain across the Vienne; XIVth century. (7) Another bridge over the Vienne at Saint-Junien, dating from the XIIIth and XIVth centuries. (8) Bridge over the Salat et Saint-Lizier (*Ariège*); restored and remodelled. (9) Fortified bridge at Sanverre, Basses-Pyrénées, on the Gave d'Oloron; XIIIth century. (10) Bridge at Thouars, on the Thouet. (11) On the Rhône at Viviers (*Ardèche*). (12) On the Allier at Voût-Chilac.

Renaissance.—(1) Pont Henri IV, on the Vienne at Châtellerauld. (2) Pont Neuf, on the Seine at Paris; much altered. (3) Stone bridge at Toulouse across the Garonne. (4) Pont Marie, Paris. (5) Pont Saint-Michel, Paris.

XVIIIth Century.—(1) Pont Royal, Paris. (2) Pont de l'Isle, near Bonneval. (3) Pont de Blois. (4) Pont des Belles Fontaines, near Juvisy. (5) Pont de Tours. (6) Pont de Dizy, near Epernay. (7) Pont de Neuilly. (8) Pont Fouchard, near Saumur. (9) Pont de Pont-Sainte-Maxence. (10) Pont de Brunoy, on the Yères. (11) Pont de la Concorde, Paris. (12) Pont de Nemours, on the Laing, and Pont de Saint-Dié, on the Meurthe.

Turning now from Central France to Languedoc, we get many bridges from the XVIIIth century:—(1) Pont d'Ornaisons. (2) Aqueduc de Montpellier. (3) Pont des Minimes, Toulouse. (4) Pont de Carbonne. (5) Pont de Mazères. (6) Pont de Rieucros. (7) Pont d'Homs, on the Aude. (8) Pont du Somail. (9) Pont de Villeneuve-lez-Magnelonne. (10) Pont de Lavaur; very interesting to students. (11) Pont de Mirepoix. (12) Pont de Gignac; to be studied side by side with the bridges of Lavaur and Vizille. (13) Pont de Montferrier.

Belle Alliance Bridge, Berlin.

[Photo. by Frith.]

Bridge at Navilly on the Doubs. From a Drawing by M. F. de Darstein.

(From *l'Architecture*.)

Bourgogne, XVIIIth Century.—(1) Pont de Cousin, near Avallon. (2) Pont de la Barque, near Louhans. (3) Pont des Echavannes at Cha'lon. (4) Pont de Neuville-sur-Ain. (5) Stone bridge, near Auxerre. (6) Pont de Guernon. (7) Pont de Navilly. (8) Pont de Chalon.

The work done during the XIXth century cannot be summed up in a short list; it is too various in types. But attention should be given to the viaduct of Chaumont and the great viaduct of Roquetavou, which dates from 1845. The design of Belgrand can be studied in the bridge aqueduct of Montevau, while the viaduct of the Pont-du-Jour, at Auteuil, brings us in touch with the collaboration of Bassompierre and Villiers du Terrage. Useful hints can be got from Larousse, and M. Béranger, the Paris publisher, is a sure guide through the maze of metal bridges.

The number of important bridges in France was 1,982 in 1873. Of these 861 were built before the XIXth century, sixty-four during the First Empire, 180 during the Restoration, 580 during the reign of Louis Philippe, and 297 since 1848. Nine of the 1,982 bridges were of iron; fourteen of wood; twenty in mixed materials, stone, iron, and wood; sixty-seven in masonry and wood; and 854 in stone. No fewer than 1,067 were on national roads, and 831 on departmental highways; only eighteen belonged to the strategical lines of communication. The total length of all these bridges was estimated at 106 kilometres, and their total cost at 286,507,761 francs. Last of all, here is the cost of eleven very notable French bridges:—

1. Bordeaux, 501 metres; 6,850,000 francs.
2. Dordogne, at Cubzac, 545 metres; 2,200,000 francs.
3. Saint-Esprit, on the Rhône, 738 metres; 4,500,000 francs.

4. Toulouse, on the Garonne; 2,700,000 francs.
5. Libourne, on the Dordogne; 4,236,248 francs.
6. Tours, on the Loire, 434 metres; 4,224,639 francs.
7. Pont de la Guillotière, Lyon, 263 metres; 2,500,000 francs.
8. Pont de Brest; 2,800,000 francs.
9. Pont Neuf, Paris, 231 metres; 4,000,000 francs.
10. Pont d'Iéna, Paris; 6,135,105 francs.
11. Pont de Roanne, 232 metres; 6,438,561 francs.

If we knew what the bridges of Europe now represent in their total money value we should be astonished beyond measure that an age of trade that hovers continually on the brink of war has not had enough common sense to make them as secure as possible from the perils of strikes and artillery. I am the first to draw public attention to this fact since Perronet gave his warning at the end of the XVIIIth century.

TOWN PLANNING AT BIRMINGHAM UNIVERSITY.*

"In taking up this subject it seems appropriate to tell you shortly what the scope and character of town planning appear to me to be, and the kind of qualification desirable for those seeking to practise the art, to explain the method of teaching which it is proposed to adopt, and finally to show you something of the results of town planning as practised in other countries and at various periods, and so try to give you a bird's-eye view, at it were, of that region which it will be our purpose to explore during the coming sessions.

During the last century the town has become a unit of increasing importance in the national life; and one of the greatest tasks which faces us to-day is to transform the amorphous aggregations of population, which by courtesy we call towns, into genuine communities, the expression of whose highly organised social life shall be worthy of the honourable title of city. We need to bring into our city life the same guiding oversight and direction in developing the opportunities which its position affords, the same correlation of all the different parts, which are found so essential for a great modern industrial concern. Town planning is simply the medium through which this organising movement finds its practical expression; the means which will enable each community to foster the growth and efficiency of those industries upon which its prosperity depends, by providing for their expansion in those districts where they will have the greatest convenience of rail and water carriage, power, heat, and light, in close touch with the many subsidiary requirements which facilitate their work. Through town planning the community can provide for the most convenient communication by rail, road, or car between the industrial regions, the great centres of wholesale and retail exchange and the various residential districts. Through its means the most healthy and attractive areas can be reserved for residential purposes, and their proper development, having regard to health, convenience, and amenity, can be secured; through its agency also provision for recreation can be made by the proper distribution of playgrounds, parks, and open spaces.

* From the inaugural lecture on "Civic Design," by Mr. Raymond Unwin, given on October 6 in the Mason College Building.

Ponte della Pietra, Verona.

Photo. by Bridg.

It is difficult to exaggerate the direct many, increased efficiency, and improved opportunities of life which the organisation may lead to, and the impetus which thereby be given to the development of a race of healthy and energetic citizens. Then, very meagrely stated, is what I have to be the scope of town planning; you see it is essentially a synthetic art. It is in assembling and marshalling many, co-ordinating many activities for their mutual benefit, and combining the individualities of their expression so as to produce a happy, convenient, and a beautiful city. Town planning is not work which we should characterise as highly technical, in the sense in which we should apply that term to the building of ships and bridges, or to the determining beforehand of the acoustic properties of a great hall, for example. The knowledge required is extensive rather than intensive, the difficulty of the work is due, not to a high degree of scientific attainment and technical skill necessary for the solution of problems, but to the number of the subjects which must be understood, the breadth of sympathy which must be developed to enable the town planner to appreciate the various phases of life which underlie the activities of the city, and to the range of imagination required to embody the material suggestions of these activities in one synthetic design that will at once conduce to utmost efficiency and provide for a high degree of beauty as the result of their groupings. In teaching town planning a somewhat wide field must therefore be covered, perhaps wider at the present time, because of the bearing of other subjects upon town planning has not yet become part of the ordinary teaching in the different sciences and arts contributing to it.

Essential Qualifications of Promoters.

It is described as a co-operative art; it can be successfully carried out on a large scale only by the cordial co-operation of many persons. The architect, the surveyor, the engineer, the planner, the economist, the sociologist, and

View of the City of Ephesus from Mount Coressus.

(By E. Falkener, 1859.)

even the antiquarian must all contribute their experience and their skill. Some of them must decide absolutely the limits within which the design must be worked out, and each of them in future must understand the bearing of his own branch upon town planning, as part of his equipment. It is hoped that this course of lectures may be helpful to many who will be brought in touch with the work in this way, but who may never intend actually themselves to design town plans. Some, however, will in this narrower sense seek to become town planners. What should be the qualifications of such a one? He cannot expect to become an expert in all the subjects touched upon, but he must at least know enough of each to be able to co-operate intelligently with those who are experts, and to assign to the contribution of each its proper

place in the whole. He will not, for example, be a doctor, but he must understand the conditions of health in home and factory, and must appreciate the importance of space, fresh air, and sunlight; he need not be a political economist, but he must have enough knowledge of the economics of ground rent and house rent to be able to determine the limits of air space in the dwelling and garden space around it which can be provided in a practicable scheme. He need not be a tramway engineer or a road surveyor, but when the expert in one branch asks that a road shall be straight, for the cheaper and simpler installing of his lines and conduits, and he of the other that it shall be curved to secure a more even gradient for the surface, the town planner must know enough to appreciate the value of both requirements, and to weigh them, possibly, against the request of the antiquarian that some ancient building on the line of the road shall be spared.

You will think, perhaps, that I am drawing a speaking likeness of the Jack-of-all-trades, so let me hasten to add that the successful town planner must be a past-master in the art of design, the art of combining in the proper proportion many different parts, so as to bring them into that harmonious relation which creates of them one organic whole. I have ventured to call town planning an art, because it seems to me that in essence it consists in expressing in a beautiful outward form the life of the community. By the greatest good fortune it has happened in England that town planning has actually developed from an attempt to improve the homes and lives of the individual members of the community. I wish to emphasise this point because in some other countries, notably in America, town planning has come about from other considerations. If we look back a few years, to about the time when Bournville was founded, we shall find that the movement began with an effort to reduce overcrowding, and to improve the individual dwellings of the people; that the work extended to the surroundings of dwellings, to meet the need for gardens, playgrounds, and open spaces. From this those who were working at the problem went on to try and group these improved dwellings into streets, which should themselves be pleasant places, and so to arrange these streets that they might form attractive villages, such as Mr. Cadbury created at Bournville. Finally, the necessity became evident for extending this work, for fitting these villages into the whole scheme of development, and for bringing the same improvement to bear upon the other branches of town life. Only so could these new residential areas be brought into proper relation with the industries, the public buildings, and the open spaces. Thus has town planning in England developed out of the actual needs and life of the people. The essential importance of maintaining this close touch between the life and its expression I cannot too strongly emphasise, particularly as there is a general idea that when we speak of art in connexion with such a subject we mean the

Plan of the City Centre, Ephesus.

(By E. Falkener.)

imposition upon the community of some pre-conceived pattern or design, spun out of the imagination of some detached artist into which the life of the community is to be cramped, regardless of its convenience, its comfort, or its health.

It cannot be denied that examples of town planning may be found that have been carried out on these lines, but it seems to me that it is just because town planning should be, not the work of a dictator foisting upon the public his own pet scheme, but the work of one, who, by his wide sympathy and imagination, shall become the medium, as it were, through which all the various needs of the civic community can find expression and co-ordination, that one is justified in calling it an art.

While, therefore, in my own mind, I cannot separate that side of town planning which consists in providing for the practical needs of the community, from what seems to me equally natural, namely, the beautiful form which their expression should take, it is only as the definite outgrowth of the practical, it is only after those different needs have been thoroughly considered and provided for, that it seems to me possible to bring to bear upon the form of their expression that power of co-ordination, that faculty of design, which will lay the foundation for beauty in the completed work.

Relative Factors in Design.

In teaching our subject, therefore, we shall begin with some study of the different human requirements that a town should satisfy, and inquire into the best practical means of providing for them, seeking to understand the different units of our design before we attempt to put them together. We shall study the individual home, the various kinds of house adapted to the life of different members of the community, the disposition of its different rooms and offices in relation to the street and to the aspect of its frontage, to secure the most healthy and convenient dwelling within the strict limits of economy. We shall study the question of gardens attached to the house, the size of plot which is desirable, and the relation between this, which fixes the number of houses to the acre, and the cost of land development, tracing the effect upon the house rent.

We shall take the workshop and factory, the market and commercial building, the school, church, and public buildings, and consider their requirements in the same way. We shall study the different kinds of open spaces, such as the playground, the park, and the reserved area of wild country, and their relation to the population. We shall inquire into the varying amounts of traffic developed in different circumstances, and the width and kind of road desirable to meet each case.

together with the relative cost of these roads and the effect of their use upon the rent of adjacent land. Only when we have learned something of these component parts shall we be ready to combine them in the planning of sites. At this stage we must take account of the influence which the nature of the site must exercise on our plan; we must survey its surface, take levels, that we may record its undulations by contour maps or models, and note its natural features. Having done this, we must study the spacing of the roads upon its surface, their relation to the contours, and their lines, whether straight or curved.

Finally, the architectural considerations governing the grouping of the buildings upon the site, and the reaction of these upon the exact form of the plan must be studied.

Thus we shall be prepared to undertake simple site planning, to bring together units which we have studied, and to dispose them in suitable designs for limited sites. We shall then take up the wider field of the relation of the site plan to the town plan; we shall find that we must study the social and economic conditions of the whole population much as we have studied those of the individual units. We shall realise how necessary a preliminary to town planning on a large scale is the "civic survey," as Professor Geddes has well called the study. Such subjects as the varying density of population, the past development of the city, its present tendencies of growth, its existing railway and other traffic facilities, the distribution of water supply, drainage, and other services, must all be understood before we can wisely attempt to plan the town extension. We shall find that there already exists, or needs creating, some civic centre, or perhaps minor centres, where the public or semi-public buildings can be grouped in convenient relation to one another; the position of these and the configuration of the ground will together greatly influence the main framework of roads. We shall eventually come to see how the practical requirements of the city, the relation and proportion between its central spaces, its main highways, its minor centres, and its subsidiary roads, leading naturally to emphasis in some parts and subordination in others, harmonise entirely with the principles of design, and how the proper provision for and expression of the varying requirements, so far from hampering the designer, will help by the opportunities afforded towards the creation of an orderly and beautiful result. This does not mean, however, that no care is to be taken to produce a beautiful result. Beauty is, indeed, intimately associated with use, with fitness for purpose and function. But it is not the same thing. Use and fitness dictate certain lines of development, but usually they are not exact lines, rather they

are limits of deviation. It seems to me that it is the duty of the town planner, in so far as he is an artist, to learn those limits, seldom to transgress them, and then only to attain results overwhelmingly worth while. So long as we approach our work in this spirit, no study of the beauty of style will be too thorough, no training of our imagination and taste too severe, that will teach to judge the right relation between mass and voids or will help us to acquire a feeling for proportion which is the qualification for fine design. It will indeed be a great accomplishment if we can satisfy the practical requirements of our cities by town planning, but it is quite unnatural for man to be content with this. Every town planner should look forward to acquiring power of imagination, which will enable him by the spacious and orderly disposition of the parts upon the level plain, or by the placing of them up in masses on the hillside, to express something of the dignity of corporate life which it is his highest function to reveal.

Need for Co-operation.

It will be sufficiently evident that such results can only come about by the cordial co-operation of all those engaged in city development, supported and encouraged by intelligent appreciation of the citizens; for this reason it is hoped that this lecture may be of use to many who will not attempt the practice of town planning themselves, but to the architect, that he may realise the dependence on the engineer and surveyor that he may in the design of his building consider the total effect of the town as a whole, that the individual promises of his own building; to the engineer, that he may realise the intimate connexion between all his work and the activities and life of the people, and that he may appreciate the importance and function of the designer to the final perfection of beautiful form; to the student of social science, that he may realise how the life of the community and the form of its city act and react upon the other, and how, through the power given by the Town Planning Act, which forms one of the later portions of our statute book, so much may be done, not only to express, but to foster the social life of the community.

As I hope the town planning school will be by putting a new point of view; contribute in some slight extent to the interest of work in the schools of allied departments, so I am sure it will derive most valuable help from co-operation which may be practised. Contact with the school of social studies will give us new insight into the problems of the practical solution of which town planning is concerned; and it is possible with their aid that we may be able to make some civilities of parts of this city which will not educate ourselves, but may be of some use to those who have undertaken the great task of making a plan for the whole of an important city, for I am sure this is the towards which they have made a beginning.

Association with the department of engineering under the inspiring leadership of Professor Dixon, in whose department a school has been placed, will not only keep us practical, but will, I hope, give us expert guidance on many matters connected with the surveying and engineering side of town planning. I am already fascinated by the new possibilities which Professor Dixon's system of photographic survey seems to open up for attaining a thorough grasp of the physical features of the site, a matter of the greatest importance in the higher fields of town planning.

There being in this University no department of architecture with which perhaps the subject of civic design and town planning would naturally be associated, we could, I think, have had better fortune than to put under the guidance of Professor Dixon.

Mr. Unwin illustrated and emphasised many points by showing on the screens some results already attained by town planning.

FORTHCOMING SALES.

Next Wednesday, October 18, will be at the Auction Mart, by Messrs. Edwin Bousfield, Burnetts, & Baddeley, the building site now occupied by the New Synagogue, Great St. Helens; also adjoining land of the same day will be put up for sale freehold property at Harrow Weald, owned by the Middlesex Duck Plant.

View at Hampstead Garden Suburb.

GENERAL NEWS.

Professional Announcement.

Messrs. Raphael Tuck & Sons have commissioned Mr. Bernard F. Gribble to design Christmas cards for their Majesties King George V. and the German Emperor.

Rebuilding in Regent-street.

Our issue of September 15 we illustrated Henry Tanner's designs for the rebuilding of Oxford-circus—south-west bow—and out-street to the corner of Princes-street, in the present Crown leases fall in. The erection has been begun of Nos. 114-120, the east side of the street, for Messrs. J. Nicoll & Co.'s new premises after Mr. Henry Tanner's designs. The old shop premises stand in one of the blocks designed by Nash.

King Edward VII. Memorial, India.

The bust of King Edward VII., to be sculpted by Mr. A. Bruce-Joy, will be placed by the Executive Committee of the Memorial Fund, Punjab, in the Mayo Hospital, whose name forms part of the Memorial scheme.

Statue of King Edward VII., Manchester.

Mr. John Cassidy has been appointed the sculptor of the Manchester memorial to the King, which will consist of a colossal bronze figure, in Garter robes, with sceptre and orb, upon a granite pedestal 30 ft. high, overlooking Piccadilly.

St. George's Church, Leicester.

The fire that broke out in the night of October 5 at Messrs. R. Rowley & Co.'s premises in Queen-street, consumed the roof of St. George's Church, and eventually destroyed all but the spire and walls of the fabric. The church was built in St. Margaret's parish by the Parliamentary Commissioners, at a cost of 18,000*l.*, from designs, in the later English style, of Parsons.

The Widening of Euston-road.

The General Purposes Committee of the St. Pancras Borough Council are to recommend the Council to refuse its statutory consent to the proposal of the London County Council to construct a new tramway along the Euston-road link up the existing tramways with those King's Cross pending a satisfactory decision regarding to the widening of Euston-road throughout its entire length.

The Kursaal Site, Margate.

The freehold of the Margate Kursaal site, together with the partly-erected buildings, pier, and the sea wall and promenade, are to be sold on Monday, the 16th inst., by Messrs. Reeve & Son, at the White Hart Hotel, Margate. The property has a direct sea frontage of about 600 ft. The lot will include a freehold site, situate in Cold Harbour, having a sea frontage of about 150 ft. adjoining the above.

Manufacturers and Strikes.

It is stated that the circular of the Council of the London Waterside Manufacturers' Association with respect to the proposed general organisation of London manufacturers for defensive purposes is meeting with a wide response, and that a list of those firms who prepared to join the new combination will be published shortly.

Westcliff Esplanade.

It is probable that the Western Esplanade will be completed during the winter months at Westcliff-on-Sea.

Labourers' Cottages, Newtownards.

In view of the need for additional cottages in the Newtownards district, the Rural Council are urging the Local Government Board to hold an inquiry on an early occasion so that loan may be arranged.

Royal Archaeological Institute: Visit to Westminster Abbey.

An autumn meeting of this Institute will be held at Westminster Abbey on Friday, October 20, under the direction of Mr. V. H. St. John Hope, to complete the examination of the medieval monuments and effigies. Admission will be by ticket, and tickets will be issued to members strictly in order of application. Members desirous of attending are requested to apply to the Secretary, G. D. Hardinge-Tyler, Secretary, 3, Bloomsbury-square, W.C., at once, enclosing a postal order for 2s. 6d.

The Model Engineer Exhibition.

This Exhibition is being held at the Royal Horticultural Hall, Westminster, S.W., from October 13-21. It is the third of its kind, and demonstrates the recent progress which has been made in model or small-power engineering, both as a hobby and as a useful factor in technical education. A model railway, 76 ft. long, will be shown, on which steam and electric locomotives will be running. Some of the models will pull one or more passengers. An engineering workshop, fully equipped with lathes and light machine tools, is arranged, in which daily demonstrations of model-making and metalworking processes will be given. Mr. V. E. Johnson, M.A., will show a working model electric gyroscopic monorail rail, several types of harmonographs, and geometric pens drawing curves. There will also be a collection of about 100 models entered in competition for gold and silver medals, and a loan section, containing a number of models of an interesting nature. Amongst these is a working model of a modern engineering workshop, to the building of which Mr. E. J. Windsor, a North London optician, has devoted his spare time for sixteen years. It reproduces screw-cutting lathes, milling and planing machines, benches, hand tools, overhead travelling crane, and even the steam engine which drives the shop. There will be a trade section, in which will be found an array of tools, castings, and materials required by model engineers.

Lectures on Renaissance and Ancient Architecture.

Mr. Banister Fletcher gave on October 2 the first of his course of lectures on "Renaissance Architecture." He explained that he would deal with architectural history from a popular point of view, and trace its evolution in the countries of Europe. He referred to the history of architecture as a visible exponent of civilisation uniting and embracing the other arts, and pointed out that all modern design was founded upon old art, but altered in order to conform to existing conditions. A knowledge of architecture is necessary to architects, craftsmen, and art students, and authors also require a knowledge of it for the setting of an historical novel, because a mere story about people without reference to the buildings in which they lived would remain dull and uninteresting. The antiquary and the connoisseur should also be interested, for the fascination of collecting is much increased by a knowledge of the dates and periods of architecture. The teaching profession is beginning to realise that to make history interesting the students should be shown the type of buildings in which our ancestors lived and worshipped. A knowledge of architectural history was indispensable to all who travelled, for to travel without such a knowledge was like having a book in front of one without the ability to read it. Mr. Fletcher next gave a short illustrated résumé of ancient and medieval architecture in order to show the evolution of architectural forms from the earliest times. Mr. Fletcher's first lecture on "Ancient Architecture" was given at the British Museum on the Tuesday following. Architecture, the lecturer explained, was the visible exponent of civilisation embracing the other arts, and all present-day buildings were founded upon old art suited to modern needs. The study of architecture was thus necessary to architects, craftsmen, and art students, and, further, it would be difficult to find anyone to whom a knowledge of the subject would not be beneficial. The author, journalist, photographer, and antiquary all required a knowledge of the evolution of the successive periods of architecture in order to help them in their work. The teaching profession now also endeavours to make history interesting by referring to the dwellings and temples constructed by the different peoples to suit their social and political requirements. A short illustrated review of ancient architecture showed the different types of buildings and referred to the various influences—geographical, geological, climatic, religious, social and political, and historical—which aided in their evolution.

University College Course in Heating and Ventilation.

The Institution of Heating and Ventilating Engineers for some time has been endeavouring to promote the interests of the scientific study

in the higher branches of heating and ventilation engineering in some of the centres for higher technical education in this country. With the help of a grant from the London County Council, a lectureship has been instituted at University College, London. A laboratory has been equipped, and it is hoped that the work will receive the support of those interested. Mr. A. H. Barker, B.A., B.Sc. (Lond.), Whitworth Scholar, has been appointed the first lecturer. There are many questions in heating and ventilation which have not been investigated, and very little knowledge is available on some points, and the work to be done at University College should therefore be of considerable value to the community. Germany has long been provided with elaborate and extensive buildings for the study of this subject, the funds having been provided by the Imperial Government. The Government of this country is not in such close touch with the requirements of technical education as the Government of Germany is, and in consequence this branch of engineering has hitherto suffered from neglect, and the thanks of the community are due to the London County Council for their public-spirited action. The session is to be opened by a series of public lectures at University College, in which the present position of the knowledge of this science will be discussed and reference made to the paths along which development is to be expected.

CORRESPONDENCE.

Burslem Public Buildings.

SIR,—I shall be obliged if you will kindly note in your next issue that the above was the joint work of Mr. T. E. Cooper and myself.

S. B. RUSSELL.

Manchester Library Competition.

SIR,—There has been a delay in publishing the award of the assessor, and the cause has now been made known. The assessor has placed a design first which does not comply with one of the most essential conditions, and which provides a library of a type which the Committee do not want, and which, if erected, would be not only out of date, but would make the city ridiculous. All the books, the *Manchester Guardian* states, are in the selected design to be placed in the cellar.

On page 5 of the printed instructions precise details are given of the book-store required, which would be similar to that of the design placed first in the great Welsh Library Competition, illustrated in the *Builder* some time ago. The Manchester Libraries Committee visited the best recently-erected libraries in Europe and the United States, and published a report, illustrated with plans of the best modern libraries, which all competitors could consult at the present reference library. There can be no doubt whatever of the type of book-store the Committee required. It was the business of the assessor to study this report, to ascertain the result of the Committee's visit to type libraries, and obtain their views and experience of library management; above all, to see that the conditions embodying these views were adhered to by competitors. The assessor could see in the Manchester libraries books stored in cellars and on the most modern system, and a moment's conversation with the librarians would have convinced him that the storage of books in a cellar is preposterous and hopelessly out of date.

Manchester architects are taking vigorous action; a protest has been sent to the Libraries Committee, suggesting that the award should be set aside, that the competition should be reopened, other assessors appointed, and that competitors be invited to send back their designs for further consideration. The writer suggests that competitors from all parts of the country should write to the Libraries Committee, Town Hall, Manchester, to the same effect.

There is no excuse whatever for the assessor's selection; the intention of the Libraries Committee is perfectly plain, and, should there have been any doubt, a moment's conversation with the Chief Librarian would have cleared up the point, and convinced him that the storage of books in a cellar would

We are informed that another old business in connexion with the building trades was likely to disappear, at any rate in its present conditions, *i.e.*, the slate, stone, and general builders' merchants' business at Greenwich, the late Mr. E. P. Trenchard. It is said that the business, which for a century old, and it is mainly because the late Mr. Trenchard had authorised the executors to carry it on after his death that the latter are now disposing of The wharves occupied for the business are now to be sold or let, and the stock and plant shortly to be offered under the hammer. It will be seen from an advertisement which we have elsewhere published, that it is proposed that the goodwill, together with the use of the trade name of E. P. Trenchard, shall form the subject of the first lot.

EDITORIAL SUMMARY.

The leading article, "Decorative Materials," deals with the relationship of materials to each other, and with the difficulties of harmonising them and at the same time expressing their different functions.

"Archæology in India" is the title of a second leader, which deals with, and quotes from, Lord Curzon's recent letter of protest to the *Times* (p. 410).

"Notes" (p. 411) include: "The Infirmary, Manchester"; "Metropolitan Water Supply"; "The Irish Railway Strike"; "The British School at Rome"; "Variations in quantities"; "Lake Dwellings."

The ninth and concluding article of the series on "The Story of the Bridge," by Mr. V. Shaw Sparrow, is given on p. 412. The author deals with the importance of the practical treatment of the subject.

An inaugural lecture on "Civic Design" was delivered on the 6th inst. at Mason College building, Birmingham, by Mr. Raymond Unwin, and a *résumé* of it, with illustrations, will be found on p. 414 under the heading of Town Planning at Birmingham University.

Correspondence (p. 417) includes the following items: "Manchester Library Competition"; "The Further Strand Improvement."

Book notices (p. 419) include: "Building in London"; "Ceilings and their Decoration."

The illustrated Monthly Historical Review (p. 421) includes: "The Coptic Monasteries of Wady-el-Natroun, Lower Egypt"; "The Luttra Museum, India"; and "Notes."

The Building Trade Section (p. 427) includes: "Party Walls—Some Legal Points"; "The Trade Unions and Strike Pay"; "The Industrial Council"; "Projected New Buildings in the Provinces."

Law Reports (p. 432) include: "Ancient Lights Case" and "Reinstatement after Fire."

MEETINGS.

FRIDAY, OCTOBER 13.

London Salon of Photography (5a, Pall-mall).—Lecture by Mr. Arthur Marshall, A.R.I.B.A., entitled "With a Camera in Holland." 8 p.m.
Glasgow Architectural Craftsmen's Society.—Mr. J. S. Glen-Fraser on "The Microscopic Examination of Architectural Materials."

SATURDAY, OCTOBER 14.

Royal Sanitary Institute.—Provincial sessional meeting at the Council Chamber, Town Hall, Hull. 12 a.m.

MONDAY, OCTOBER 16.

Architectural Association.—Mr. Raymond Unwin on "Town Planning, Formal or Irregular." 7.30 p.m.

TUESDAY, OCTOBER 17.

The Institution of Heating and Ventilating Engineers (Incorporated).—The autumnal general meeting, at the Institution of Mechanical Engineers, Storey's-gate, Westminster, S.W. 6.30 p.m.

Battersea Polytechnic.—Professor J. T. Morris, M.Inst.E.E., on "Electric Lighting." I. 7.30 p.m.

THURSDAY, OCTOBER 19.

University College.—Second of eight public lectures by Mr. Edward S. Prior, F.S.A., F.R.I.B.A., on "English Mediaeval Architecture." 6 p.m.

FRIDAY, OCTOBER 20.

The Royal Archaeological Institute.—Visit to Westminster Abbey. 10.30 a.m.

SATURDAY, OCTOBER 21.

The Institution of Municipal Engineers.—The third annual general meeting, to be held at Windsor.

COMPETITION NEWS.

Whiteley Homes Trust.

The trustees have appointed Mr. W. Cave, F.R.I.B.A., as their consulting architect, and will hold a limited competition for laying out the site of 220 acres they have bought near Walton, Surrey, for the erection of the Homes, with a church, sanatorium, and other buildings, in terms of the trust.

Rebuilding Fitzalan Market, Sheffield.

The Markets Committee of Sheffield City Council have brought forward a recommendation to the effect that they be authorised to invite designs for the rebuilding of the Fitzalan Market on its present site, less land required for street improvements.

BOOKS.

Building in London. A Treatise on the Law and Practice Affecting the Erection and Maintenance of Buildings in the Metropolis. By Mr. HORACE CURRIE, A.R.I.B.A., P.A.S.I. 1911. (Constable & Co. 31s. 6d.)

We cannot but offer our congratulations to the author of the above work on the service he has rendered to all who are in any way connected with building interests in London. This book supplies a want that has been felt for some time past, since Acts and Regulations have become so numerous and far-reaching that it is impossible to be satisfied that all are complied with, unless reference is made to a book of this character. We are aware that other publications have dealt with legal and sanitary requirements, but we do not know of any covering the ground quite so fully as this.

About half the book is devoted to a recital of the Acts of Parliament and by-laws now in force, commencing with Michelangelo Taylor's Act of 1817, and extending to the latest Building Act and the Housing and Town Planning Act. This recital is a necessary component of a work such as this, and by including portions repealed (in italic) has the more value as tracing the revisions these Regulations have undergone.

The book opens with a *résumé* of these Acts and Regulations, and the leading cases in which difficult points have been decided. The various sections of constructive work are conveniently classified; one chapter is devoted to calculations required under the Act of 1909, and another to the means of escape. The scope of the work also includes the rights between private parties, a section on the cost of building work carefully drawn up by Mr. H. J. Leaning, and one on property, including valuation and land development, by Mr. Sydney A. Smith.

We may say that we have tested the information given, in numerous cases drawn from everyday experience, and find that for accuracy and clearness it can be confidently relied on. Altogether, we think that the author deserves very high praise for the systematic way in which he has handled his material.

Ceilings and Their Decoration. By GUY CADOGAN ROTHERY. (London: T. Werner Laurie. Price 6s. net.)

THE subject of interior embellishment is of great antiquity; indeed, the author has found no difficulty in tracing decorative work of the kind back to the days of mud walls, when the dwellings of the day were beautified with the aid of coloured shells stuck to the yielding surfaces. That was the earliest form of mosaic, a method of decoration which has recommended itself through the ages. Ceilings include, of course, many architectural features, such as the fan vaulting of Henry VII.'s Chapel in Westminster Abbey and hammer-beam roofs, to which attention is given in the handy book before us. The actual work of all kinds which remains has been a source of continual investigation and comment, while in comparatively recent years there has been a revival in heroic decoration to which such artists as the late Edwin A. Abbey and Mr. John S. Sargent have ably contributed.

Mr. Rothery has studied the subject of ceilings to some purpose, and, writing from a critical standpoint, he easily convinces us that we have a lot to learn from the construction and decoration of ceilings in the past. It does not lessen our interest in the author's opinions that we do not always agree with many of his conclusions. For instance, in such an argument as the following:—"A further downward step is noticeable with the work of the brothers Adam, who came within measurable distance of the brick box with cheap stereotyped classical ornamentation stuck on in the manner and style of pink and white cake decoration. Like Jones, Wren, and Kent, they preached the necessity of treating walls, doors, chimneypieces, ceilings, and even furniture decoratively in harmony with the architectural scheme of the building or room. The pity was that in attempting to adapt the classic style to the economical needs of the day they degenerated into

mechanical namby-pambyism. In their ceiling work they lightened the panels, employing Zucchi and others to adapt Grecian designs to modern conditions. The designs are simplified, or so arranged as to be easily moulded in their patent stucco, which could be prepared in the studio and placed in position to advantage. Sworn enemies to the glare of white, of the bold work of Jones and Wren, they adopted genteel tints (of the milky and chocolate cream order) and nice line and scroll work. In a few words, it was all devoid of strength and sincerity."

It is a pity the illustrations were not made on a larger scale, as in some instances it is difficult to study the designs reproduced.

BOOKS RECEIVED.

VIEWS OF ROME FROM THE XVth TO THE XVIIIth CENTURY, FROM SKETCHES IN THE IMPERIAL ACADEMY AT VIENNA. By HERMANN EGGER. (F. Wolfmüller & Co., Vienna and Leipzig.)

FIFTY YEARS AGO.

From the *Builder* of October 12, 1861.

The Thames Embankment.

FOR long, by means of sketches and otherwise, the *Builder* has endeavoured to show the urgent necessity, particularly in the metropolis of clearly defining the margin of the Thames; and, when once that limit has been distinctly appointed, using all endeavours to keep that channel clear.

For years we have had all manner of speculations respecting the Thames Embankment. The majority of intelligent persons must have seen the absolute necessity for such a work; and yet, while the Thames has been yearly getting into a worse state, there has been a battle of opinions; in fact, while physicians were consulting the patient was being sacrificed.

At length the Government has determined upon a plan for the northern Embankment; the raising of the money for this great work has been arranged; the sanction of Parliament is only needed; and now arises a dispute between the Metropolitan Board of Works and the Government. There is also opposition from those who have wharfs and other property along the river side; and wishes have been expressed for the formation of a roadway; and, inland, a series of small docks or basins. Looking at Puddle Dock, and reading accounts of other creeks which have been allowed to branch from the Thames—knowing how much they impede the right course of the river and how unwholesome they become—it is not to be

thought of, whatever may be the additional expense, that we are to have harbours for the collection of mud and other offensive matters, thus causing ill-health to those dwelling near and making the proposed new roadway anything but pleasant and salubrious. Whatever may be the line determined upon, it is clear that a solid embankment, without docks or any creeks, must be made.

According to the plan proposed there will be a considerable quantity of land saved. At Richmond-terrace there will be 220 ft. in breadth; at Hungerford, where there is at low water such an accumulation of mud, there will be 320 ft.; at Somerset House, 120 ft.; and at the Temple, 220 ft.

ILLUSTRATIONS.

St. Paul's Cathedral, Uganda.

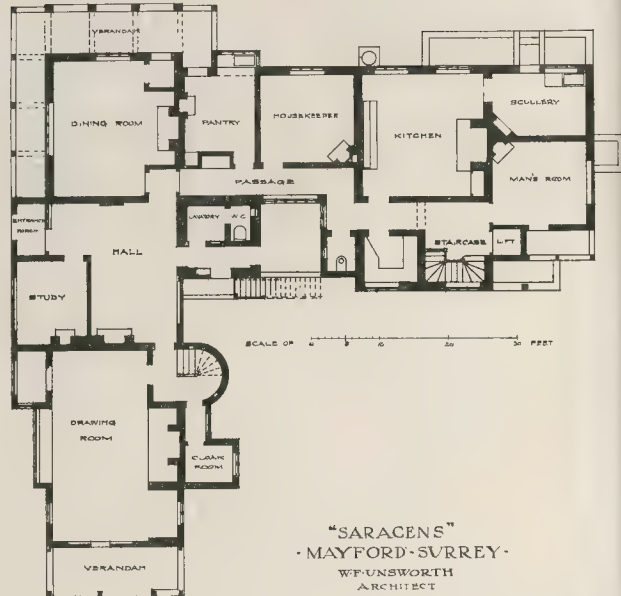

THE great missionary cathedral of Eastern Equatorial Africa, near the shores of the Victoria Nyanza Lake, was struck by lightning and destroyed a year ago. This building, on its important site on Namirembe Hill at Kampala, with its picturesque group of pyramidal roofs, formed an important feature of the landscape. The last of a series of wooden structures which had extended in size and failed in permanence, it was a sign of more than twenty years of successful church missionary expansion.

The building was of great size, cruciform in plan, with apsidal transepts, and was constructed with low brick walls carrying an immense roof of wooden structure covered with thatch.

It was therefore felt to be necessary that the rebuilt church should not only be fire-resisting and permanent, but have the character of a representative Christian cathedral.

The extent of the new building corresponds with that of the old; it is designed to accommodate the crowds of worshippers who assemble in thousands, as many as 10,000 having on great services congregated in and about the old cathedral.

Professor Pite's preliminary design, represented by the illustration, has been adopted and approved; operations are now commencing for making bricks locally and preparing the site for the erection of one of the most significant and important enterprises of the church in Africa in the present day.

"SARACENS"
MAYFORD-SURREY.
W. F. UNSWORTH
ARCHITECT

"Saracens," Mayford, Woking.

THIS house was originally intended as a golfer's cottage, but large additions were subsequently made, including the tower and the whole of the wing on the right-hand side of the drawing. The walls are of brick rough cast, and the roofs are covered with hand-made tiles. The architect was Mr. W. F. Unsworth, F.R.I.B.A., and the builders were Messrs. Norris & Son, of Sunningdale.

The Muttra Museum.

THESE illustrations show the proposed extension to the Muttra Museum, and are in connexion with the article on p. 424.

The Story of the Bridge.

THE illustrations of bridges at Orleans and Turin accompany Mr. Shaw Sparrow's ninth and last article on the subject (p. 412).

TIMBER IN ROOF COVERINGS.

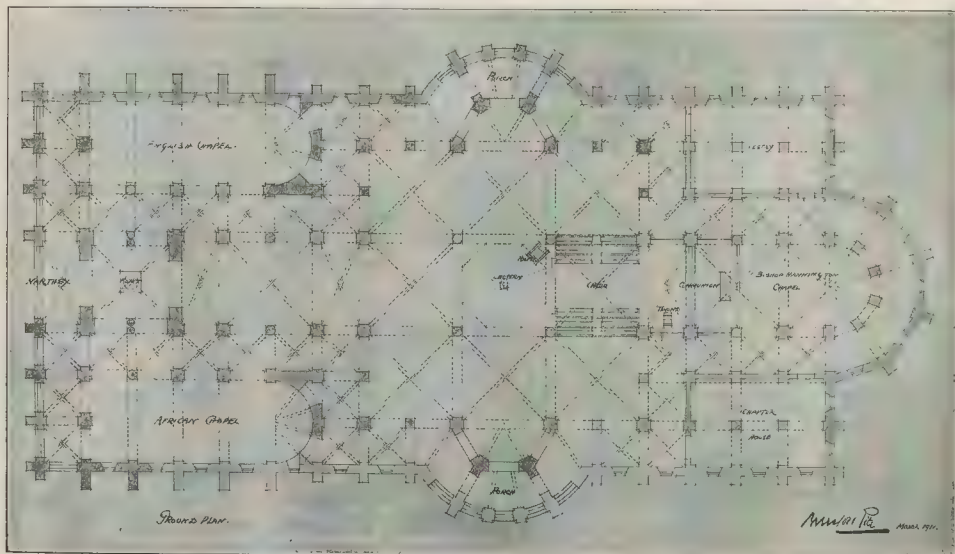

Referring to the article on "Timber in Roof Coverings," published in our last issue, equation (2), Unwin's rule, on p. 394, is wrongly printed

$$p = P \sin \theta \frac{1}{\sin \theta} \cos \theta - 1 \dots (2),$$

it should have been

$$p = P \sin \theta \frac{1}{\sin \theta} \cos \theta \frac{1}{\sin \theta} \dots (2),$$

the latter part of the expression being the index of the power of $\sin \theta$.

MONTHLY HISTORICAL REVIEW.

THE COPTIC MONASTERIES OF THE WADY-EL-NATROUN, LOWER EGYPT.

NEARLY one hundred kilometres to the north-west of Cairo, and some fifty from the nearest point of the Delta, lies the Wady-el-Natron, or Bay of Salt.

Here, surrounded by desert, are large deposits of salt and nitre and some three or four salt lakes, around which are rank vegetation, and, in places, cultivated land. To the north of these lakes four Coptic monasteries lie like derelicts from the ocean, stark and bare from the sand. Lying nearest Cairo is the monastery of Makarius, or Abu Makar; some five kilometres west of this are the monasteries of Anba Bishoi and Surian, within a short distance of each other. Still another nine kilometres west of these is Baramus. The date of foundation of these houses is indefinite, but that the site has been occupied by eighteen centuries of Christian life is certain.

The second century St. Frontonius drew to Wady-Natron with seventy disciples, but probably the surviving houses date from the IIIrd and IVth centuries.

These four monasteries all have the same characteristics, although varying greatly in size and detail.

Each monastery is surrounded by an enclosure wall about ten metres in height,

forming on plan an irregular four-sided figure. The only opening in this wall is a very low and narrow doorway.

In former times these monasteries were

subject to Bedouin raids, hence the massive enclosure walls and the small doorway, against which, in times of trouble, heaps of stones were piled. Within the walls are two

The Monastery of Baramus, Wady-Natron.

The Monastery of Surian, East Wall: Details of Plasterwork in the Haikal of the Church of Al Adria.

or three churches, cells for the monks, a guest house, refectory and kitchens, numerous storerooms, the mill, a well, and the "kasr." Part of the enclosed space is laid out as a garden, planted with date palms and vegetables and watered by small channels from the well. The "kasr" corresponds in many ways to the keep of the mediaeval castle. It was used by the monks as a last resort from the fury of their invaders, and is reached by means of a drawbridge on the

first floor, either from the gatehouse or from a flight of steps near the entrance in the enclosure wall.

It contains on the ground floor storerooms, in one of which is a well, now dry; on the first floor cells and the library, and on the flat roof is a small chapel, which seems to have been a later addition.

The "kasr" of the Monastery of Makarius differs from the others in that most of the chambers have been converted into chapels.

The various churches follow no definite plan, but, in common with all Coptic churches, they have the three eastern sanctuaries, screened off from the main body of the church. Unlike the Cairene Coptic churches, however, there are no baldachins over the altars of these sanctuaries. The more general type of plan for these churches consists of a nave with low aisles, returning at the west end, forming a small narthex and the choir, lying transversely to the

Earamus, Wady-Natroun.

and the full width of nave and aisles. Beyond are the three sanctuaries. Adjoining the churches many subsidiary buildings, chapels, storerooms, and one or two others are usually to be found. The walls are of roughly-coursed rubble, the stone for which was quarried from the

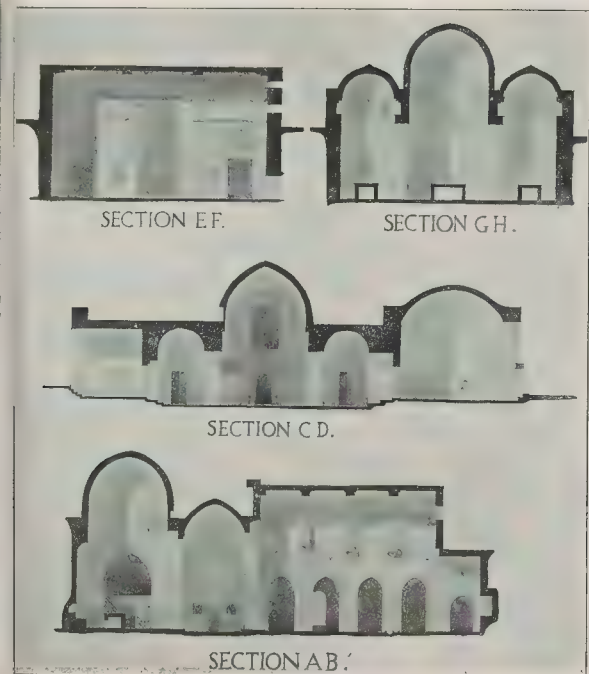

Anba Bishoi: Detail of Panel to Haikal Doors.

ert near by. The roofs are formed of series of brick domes or vaults, sometimes pointed, sometimes semicircular. The bricks, these are hard, small, and well burnt, of deep-red colour, and must have been brought on camels across the desert from

Surian Large Church: The Nave.

The Church of Al Adra in the Monastery of Baramus, Wady-Natroun, Lower Egypt.

the Nile delta. Wide mortar joints were used. These domes and vaults, as well as many ornamental details in brick, point to the fact that the builders of these monasteries had an unrivalled mastery over their material. The domes over the less important buildings are usually of rubble masonry, and many of them have fallen in. Unhappily, the walls and roofs of almost all these buildings have been coated with a thick, hard plaster, both internally and externally. This probably hides many interesting features—marble columns and caps, and also brick detail.

Within the churches are many beautiful wooden screens and doors, divided into small panels, carved with arabesques or geometrical patterns and inlaid with ivory.

In the "haikal," or main sanctuary, of the larger church of Dér Surian is some excellent work in modelled plaster, in the form of bands and panels of ornament in high relief, also several small windows with cement tracery in severe geometric patterns, in which are placed small pieces of coloured glass.

In this church also there are three semi-domes, one at the north end of the choir, one at the south, and the third at the west end of the nave, upon which are paintings of Biblical subjects, very similar to Byzantine mosaics in feeling.

In some of the other churches also paintings are to be found, but most of these are in a very bad state of preservation. There are also some few beautiful lamp-coronæ and candlesticks of bronze lying disused and covered with dust in odd corners of one or two of the churches. In places where the old plaster remains are to be found inscriptions, or "graphiti," both in Arabic and Coptic characters.

Monastery of Surian : Plaster Niche in the Haikal of Main Church.

These four religious houses are still inhabited, between twenty and thirty monks dwelling in each. Except on holy days there are only two extremely short services held daily, one in the early morning and one at sunset. The remaining time is spent by the monks in reading, working in the garden, the preparation and consumption of food, and in sleep.

As a whole the monks are ignorant, dirty, and idle, but hospitable towards strangers as far as lies in their power.

The revenue of these monasteries is derived from estates belonging to the Coptic Church, situated in the delta of the Nile.

No interest whatever is taken by the monks in preserving their ancient edifices; on the contrary, their main object appears to be to destroy the old buildings and erect new ones, as far as possible imitating in style the debased Classic or Art-Nouveau nightmares to be found so plentifully in modern Cairo or Alexandria.

THE MUTTRA MUSEUM (INDIA).

MUTTRA, or Mathura, as it is really called, is one of the great religious centres of India. Nowadays, it is chiefly connected with the worship of Krishna, the incarnated god of the Hindus, who is believed to have been born there, and the events of whose childhood are located both at Mathura itself and in the neighbouring places of Brindaban, Gokul, Mahaban, and Govardhan.

It is curious that the ancient sculptures and inscriptions which are found in and round Mathura in such abundance do not bear testimony to the existence of Krishna worship in

a very early period. The great bulk of those sculptural and epigraphical remains belong to Buddhism, which must have flourished here, particularly in the reign of the Indo-Scythian princes, who ruled over Northern India about the 1st century of our era. The closely-related sect of the Jains also possessed important sanctuaries at Mathura, and side by side with those two religions there existed the popular cults of the Nagas, or Snake gods, and of the Yakshas, or treasure-guarding goblins.

Anba Bishoi, Wady-Natroun.

The sculptures of this period are of peculiar interest, as they show evident traces of Greek, or rather Hellenistic, influence, which penetrated into the north-west of India from the Grecian kingdom of Bactria. This will be evident from the Bacchanalian group in the Mathura Museum (Fig. 1), and from the Hercules with the Nemean lion in the Indian Museum, Calcutta. It is obvious that these are not works produced by the first artists of Hellenas, but, notwithstanding their degenerated character, the classical origin is unmistakable.

It is not a little curious that the image of Buddha is in all probability a creation of the Græco-Buddhist artists of North-Western India, as in the older, purely indigenous monuments his figure is never shown, but is always replaced by some sacred symbol. The Buddha image of the Indo-Scythian period, such as it occurs in Mathura, does certainly not betray its Western origin at first sight.

Fig. 1. Bacchanalian Group from Pali Khera (Muttra Museum.)

It is only by comparison with the early Græco-Buddhist type from which it is derived that its true birthright can be proved.

Fig. 2 shows one of the most ancient, and at the same time best preserved, Buddha images yet found at Mathura. It bears a votive inscription, which enables us to assign it to the Indo-Scythian period. The great teacher of Buddhism is shown seated cross-legged under the Bodhi tree with his right hand raised in the attitude which indicates the imparting of protection. He is surrounded by four attendants, two standing, his sides with fly-whisks and two hovering above and showering flowers over him. The sculpture certainly would seem to have nothing Greek about it. Yet there are two features in it which point to Western influence. First there is the halo, and secondly the indication of the folds of the garments over the left shoulder and under the feet. The treatment of the drapery is very conventional and stiff, and it clearly shows how classical elements introduced

Indian art become gradually Indianised. The one is plain except for a scalloped border. It is interesting to compare the beautiful standing Buddha image (Fig. 3) which belongs to a later period (A.D. 300-600), when the indigenous dynasty of the Gupta Emperors replaced the alien Indo-Scythians. It is under the Guptas that Indian art reached a very high degree of excellence, as will be seen from this image, the pride of the Mathura Museum. Its character is purely Indian. The treatment of the drapery, though very conventional, is exquisite, and the artist lavished his decorative skill on the halo, a true significance—that of an aureole of radiating light—being clearly forgotten. It will be seen that the scalloped border of the earlier type has been preserved. We note two miniature figures kneeling at the feet of the Buddha, no doubt the human worshippers for whose sake this beautiful image was made. A well-preserved inscription on the base mentions that it was a gift of the Buddhist friar Yasodhara, and ends with the usual formula, "Whatever merit there is in this gift, let it be for the attainment of supreme knowledge by his parents, teachers, and preceptors, and all sentient beings." The inscription is not dated, but, judge from the character, it must belong to the 5th century.

Fig. 4 shows a Brahmanical sculpture of still later period. It represents Vishnu, probably in his incarnation as Buddha. For the four hands, two rest in the lap in the attitude of meditation, whereas the two others hold two of Vishnu's emblems, the mace and the wheel or disc. The three great gods, Brahma, Vishnu, and Siva, are shown above, each seated in a little chapel. The sculpture is thoroughly Indian in its strict symmetry, its exuberance of detail, and prominently decorative character. The central figure expresses well the Eastern ideal of repose,

and thus marks what is perhaps the most typical difference between Greek and Indian art. It is noteworthy that its head is still encircled with the halo, which here assumes the form of a full-blown lotus-flower.

One of the first scholars who drew attention to the antiquarian wealth of Mathura was Mr. F. S. Growse, of the Indian Civil Service, who was in charge of the district for several years. It was due to Mr. Growse's initiative that a local museum was founded about 1881, which at present contains the best collection of Mathura art existing. It comprises Buddhist, Brahmanical, and Jain sculptures, and is particularly representative of the Indo-Scythian period, when the Mathura School was most productive.

Originally intended as a rest-house for native gentlemen of rank, the present building was begun by Mr. Thornhill, the Magistrate of the district, and some Rs. 30,000 were spent when the work was interrupted by the Mutiny. The idea was that the building should stand in extensive grounds of its own, but Mr. Thornhill's successor set to work to take the grand trunk road immediately across its front at a most awkward angle. The garden intended for it was cut off, and the neighbouring buildings run up near by without any idea of arrangement. Eventually it was entirely abandoned and nicknamed "Thornhill's Folly." In 1874, the proposal of converting it into a museum was sanctioned, and a roof added to the building, the roof of the ruined Temple of Harideva, Govardhan, supplying the *motif* of construction to the architect, Mr. Growse. A porch was afterwards added, which has unhappily been overburdened with ornament. Something simpler would have had a more harmonious effect. The proposed additions (shown hatched on plan) will amply provide for the extra accommodation which is so badly needed. At present the sculptures are packed together

Fig. 3. Image of Buddha.

(Muttra Museum.)

Fig. 2. Image of Buddha.

(Muttra Museum.)

very closely, and their arrangement does not do them justice. The new inner hall will be used for the heavier sculptures, while the adjoining bays will contain showcases, and shelves between the pilasters will serve for smaller exhibits. The new ground floor accommodation also gives a room for the Curator, library, etc., and there is ample storage for duplicate exhibits. Two flights of stairs lead up to the first floor, which will consist solely of a gallery containing showcases and shelves. The inner hall will be top lighted in addition to the windows in each of the side bays. The planning has been kept as simple as possible, the arrangement of the different classes of exhibits being primarily borne in mind. Externally, a long verandah on each side will be used for the display of those sculptures to which external air will not be detrimental. No attempt to reproduce the rich carving of the portico is to be made, wall surfaces being kept as simple as possible. The upper-story windows will be shaded by a deep "chajja." The building, as extended, perhaps appears rather long for its width, but the site did not permit of any lateral extensions. Dr. Vogel, of the Archaeological Survey of India, and the present Hon. Curator of the Museum, has worked hard for its well-being, and the scheme for its enlargement is his proposal. Much is being done by the Government to improve the condition of local museums such as Muttra. The student of Indian Archaeology is materially assisted by their existence, and he can study the topography of the "find places" of the exhibits with facility. The Government have expressed their willingness to substantially help with the funds for the proposed extension provided a satisfactory response to the appeal for funds is given locally.

It is proposed also to divert the trunk road so that it passes the building at right angles, and also to slightly change the position of a road from the east, so that the latter will approach the building axially. By this change a little circular plot will be formed in front of the Museum, on which it is hoped to erect a fountain or statue. The whole scheme, together with the road diversion mentioned above, has been estimated to cost Rs. 42,000, including the provision of extra cases and all fittings.

THE BUILDING TRADE.

TY WALLS—SOME LEGAL POINTS.

OLDERS and householders are frequently troubled with questions relating to party walls. Indeed, it is not too much to say that of the legal cases which come before the courts as to party walls form about 50 per cent. of the business. We will now enumerate a few of the problems which may arise, and then consider them in detail.

Meaning of the term "party wall." Who may build and repair a party wall. Liability for interference with a party wall.

Interference with adjoining property by a party wall. Repairing party wall.

Party walls under the London Building Act.

In answer to some of the above questions, as London is concerned, will be found in the London Building Act, 1894, and the provisions of which have been decided thereunder. The object of the subject, however, we hope to indicate the general law, and then to show the procedure which has to be followed in case a party wall is to be interfered with in London.

Meaning of the Term "Party Wall."

The words "party wall" may be used in different senses—a wall of which the adjoining owners are tenants in common, that is possibly the primary meaning of the phrase; a wall divided longitudinally into two strips, one belonging to each of the adjoining owners; a wall which belongs to one of the adjoining owners, but which is an easement or right in the other; or it may be maintained as a dividing wall between the two tenements; and a wall which is divided longitudinally into two moieties, each moiety being subject to an easement in favour of the other moiety.

Who may Build and Repair a Party Wall.

Land belonging to different owners, and are unbuilt on at the junction. When desiring to build a party wall may notice of such desire on the adjoining owner describing the intended wall. If he then, the wall may be built partly on his land and partly on that of his neighbour, the expense being proportionately borne; but if he does not consent, the first owner cannot build an external wall just outside the boundary of his own land. In such case, however, he may, after giving notice, lay concrete footings on the land of the adjoining owner, subject to the payment of such compensation for damage done as may be awarded by the surveyor. It is also to observe that this right to build a party wall (which is expressly conferred by the London Building Act, 1894, and only applies to buildings in the metropolis) is in parture from the common law. At common law it would be a trespass to build on a neighbour's land.

Any person in common of a party wall or who has sometimes said, does not have any obligation on the part of one owner in common towards his co-tenant to repair; but this statement is very doubtful, as regards ordinary repairs, and it is probably erroneous, as regards necessary repairs, for at common law, where one owner in common of a party wall refused to contribute his share to the repairs, he has been compelled to fulfil his duty.

Liability for Interference with a Party Wall.

When there is no right of support exists, by pulling down his wall, who proceeds negligently, irregularly, and improperly his neighbour is subjected to more than ordinary risk, if an accident occurs may be for the accident—even where the party who has not done all that he could is his own protection (*Walters v. Pfeil*, 1 M. 364), and although the property damaged may have been so infirm that it has lasted only a few months longer,

he may be held liable in that case also: for no person has a right to accelerate the fall of his neighbour's house, the age and condition of the property injured being merely a circumstance to be taken into consideration by the jury in determining the amount of the negligence and in assessing the proper damages (*Dodd v. Holme*, 1 A. & E. 493).

(3) Interference with Adjoining Property by Altering Party Wall.

It is of particular importance that builders who are asked to effect any repairs to the walls of a house should inquire whether any party walls are likely to be interfered with. Sometimes the mere interference with one-half of a party wall involves damage to the adjoining buildings. We recall a recent case at the Lambeth County Court, where a builder was employed to repair a wall. He was not told that it was a party wall, but in effecting the repairs he produced a crack in the cross wall of the adjoining house. The adjoining owner promptly sued the man who had employed the builder, and recovered damages. In such a case it is possible that the man who employed the builder could sue him for negligence. It is to the builder that he looks for advice and guidance when he is carrying out works of this kind. He is not supposed to know anything about support, or party walls, or the mutual rights of adjoining owners.

(e) Party Walls under the London Building Act.

The expression "party wall" as used in the London Building Act, 1894, means (a) a wall forming part of a building, and used, or constructed to be used, for separation of adjoining buildings belonging to different owners, or occupied, or constructed, or adapted to be occupied by different persons; or (b) a wall forming part of a building, and standing to a greater extent than the footings projection of the lands of different owners. It is to be distinguished from "party fence wall"—a phrase used in the Act to designate a wall used to separate the lands of one owner from those of another.

In the metropolis, a wall which complies with these conditions becomes a party wall either by being built or used as such. So where a building was proposed to be erected, some portions of it being of much greater height than others, and the walls dividing the higher from the lower portions were to be carried up above the roof of the lower, so as to form the outside walls of the higher, it was decided (on the authority of *Weston v. Arnold*, 1 L. R., 8 Ch., 1,084) that the wall was not a party wall at any point higher than 3 ft. above the point at which it ceased to be a dividing wall, and that, consequently, openings might be made in it above that height.

A building owner (in London) has certain defined rights in relation to party walls. He can exercise these and no other. Thus he may (a) make good, underpin, or repair any party structure which is defective or out of repair; (b) pull down and rebuild any party structure which is so far defective or out of repair as to make it necessary or desirable to pull it down; (c) raise and underpin any party structure upon condition of making good all damage occasioned thereby to the adjoining premises, or to the internal fittings and decorations thereof; and of carrying up to the requisite height all flues and chimney-stacks belonging to the adjoining owner on or against such party structure or external wall; (d) a right to pull down any party structure which is of insufficient strength for any building intended to be built, and to rebuild the same of sufficient strength for the above purpose upon condition of making good all damage occasioned thereby to the adjoining premises or to the internal fittings and decorations thereof; (e) a right to cut into any party structure upon condition of making good all damage occasioned to the adjoining premises

by such operation; (f) a right to cut away any footing or any chimney breasts, jambs, or flues projecting or other projections from any party wall or external walls in order to erect an external against such party wall or for any other purpose upon condition of making good all damage occasioned to the adjoining premises by such operation; (g) a right to cut away or take down such parts of any wall or building of an adjoining owner as may be necessary in consequence of such wall or building overhanging the ground of the building owner in order to erect an upright wall against the same on condition of making good any damage sustained by the wall or building by reason of such cutting away or taking down; (h) a right to perform any other necessary works incident to the connexion of a party structure with the premises adjoining thereto. But the above rights shall be subject to this qualification, that any building which has been erected previously to the date of the commencement of this Act shall be deemed to be conformable with the provisions of this Act, if it be conformable with the provisions of the Acts of Parliament regulating buildings in London before the commencement of this Act; (i) a right to raise a party fence wall(s) or to pull the same down and rebuild it as a party wall.

A party wall may not, however, be raised in such a manner as to obstruct ancient lights in the adjoining premises. The notice given must be so clear and intelligible that the adjoining owner may be able to see whether he ought to give a counter-notice, and what the nature of that notice should be.

Where a class of persons such as joint tenants or tenants in common are entitled to a particular interest in the adjoining premises, notice on one such class will be sufficient.

THE TRADE UNIONS AND STRIKE PAY.

The General Federation of Trade Unions has issued a circular, entitled "Threatened Trade Unions," which expresses some apprehension that the Government may restrict the right to picket, and may restrain the right of trade unions to grant or withhold strike pay. The trade unions appear to be calling out before they are hurt, but it is hardly surprising if the recent developments of "peaceful picketing" and the granting of strike pay without the necessary resolutions and formalities have caused them to experience an apprehension that the public may call upon the Government for some redress. The Trade Disputes Act is responsible for the difficulties now experienced. "Persuasion," if it really is "peaceful," requires no statutory sanction: it is no offence against the common law. The peaceful picketing and persuasion, the creation of statute, is an anachronism and sanctions duress, either by a parade of unnecessary force in numbers or by minatory action on the part of the picketers.

The second question—the payment of strike pay—offers more difficulties, as the unions are in fact strangers to the contracts between employers and their workmen, but on the principles which prevail in law in actions for "maintenance," and which protect persons from being victimised by litigation at the instance of persons who have no interest in it, it would certainly seem equitable to restrain the unions from supporting men who have gone on strike in breach of existing contracts with their employers. Where the men have duly terminated their contracts the case would seem different, and the unions should be at liberty to support the men if they see fit so to do.

The freedom of the funds of trade unions from being levied upon where the unions have been guilty of tort and have acted illegally, granted by the Trade Disputes Act, has not only endangered the public safety, but has injured the unions themselves by weakening their authority over their members.

PROPOSED INDUSTRIAL COUNCIL.

A new national body of representatives of employers and men of the great industries of the country has been formed for the purpose of settling or avoiding calamitous industrial disputes "by which the public are adversely affected." "The Industrial Council" is to be the title of the new body.

The following is the text of the official statement issued from the Board of Trade Offices:—

"His Majesty's Government have recently had under consideration the best means of strengthening and improving the existing official machinery for settling and for shortening industrial disputes by which the general public are adversely affected.

With this end in view, consultations have recently taken place between the Prime Minister and the President of the Board of Trade and a number of representative employers and workmen especially conversant with the principal staple industries of the country and with the various methods adopted in those industries for the preservation of peaceful relations between employers and employees.

Following on these consultations and after consideration of the whole question, the President of the Board of Trade, on behalf of His Majesty's Government, has established an Industrial Council representative of employers and workmen.

The Council has been established for the purpose of considering and of inquiring into matters referred to them affecting trade disputes; and especially of taking suitable action in regard to any dispute referred to them affecting the principal trades of the country or likely to cause disagreements involving the ancillary trades, or which the parties, before or after the breaking out of a dispute, are themselves unable to settle.

In taking this course the Government do not desire to interfere with but rather to encourage and to foster such voluntary methods or agreements as are now in force or are likely to be adopted for the prevention of stoppage of work, or for the settlement of disputes. But it is thought desirable that the operations of the Board of Trade in the discharge of their duties under the Conciliation Act, 1896, should be supplemented and strengthened, and that effective means should be available for referring such difficulties as may arise in a trade to investigation, conciliation, or arbitration, as the case may be.

The Council will not have any compulsory powers."

We hope to deal with this important scheme in our next issue, but we may add here that the following gentlemen, among others, have consented to serve on the Council:—

Mr. J. W. White (President of the National Building Trades Employers' Federation), Mr. F. Chandler (General Secretary of the Amalgamated Society of Carpenters and Joiners), Mr. J. R. Clynes, M.P. (Manchester, N.E.) (Organising Secretary of the National Union of Gas Workers and General Labourers of Great Britain and Ireland), Sir George Askwith, K.C.B., K.C., the present Comptroller-General of the Labour Department of the Board of Trade, has been appointed Chairman of the Council.

BUILDING TRADES' DISPUTE.

A MEETING of the Manchester branch of the National Association of Builders' Labourers was held at the Caxton Hall, Salford, on the 23rd inst., when the general secretary, Mr. P. Flanagan, reported that the deputation had been met in the afternoon by representatives of the Master Builders' Association, to whom they had stated the claims of the labourers. They had asked for a minimum wage of 6d. an hour for general labourers; 6½d. an hour for bricklayers, stonemasons, and slaters; labourers; and 7d. an hour for scaffolders, iron-fixers, and other grades of the semi-skilled men. This was the first time they had met the employers' association, and they had asked for a code of working rules, which would apply to the conditions of their work, as similar codes applied to that of the skilled workers. The suggested rules were to cover such matters as starting time, walking time,

THE BUILDER.

[OCTOBER 13, 1911.]

and country work; they would provide for overtime at the rate of time and a quarter for the first two hours, and after that at the rate of time and a half. The employers' representatives had promised to put the proposals of the union before their association, and their reply might be expected in the course of a fortnight.

LIVERPOOL MASTER BUILDERS.

THE forty-fifth annual general meeting of the Liverpool Master Builders' Association was held in the boardroom of the Association, 24, Sir Thomas-street, recently. The chair was occupied in the earlier proceedings by the retiring President, Mr. James T. Duthie. The annual report dealt with various matters of importance to the trade. That, and the Treasurer's statement of accounts for the past twelve months, were approved. Mr. Thomas M'Hugh (Booth) was elected President for the ensuing year. The following further officers were then elected:—Mr. Thomas Rimmer, Senior Vice-President; Mr. Robert Morrison, Junior Vice-President; Mr. H. E. Cubley, Treasurer; Mr. H. E. Dallow and Mr. J. Sirett Brown, Honorary Auditors. Forty-two members were elected to form the Council for the ensuing twelve months. The Council is divided up into seven trade committees representing the following: Bricklayers, masons, plasterers, and slaters, carpenters and joiners, painters, plumbers, and glaziers, electricians, and Associate members. The retiring President was accorded a vote of thanks for his services in the chair during the past twelve months, and the meeting terminated with a vote of thanks to the Secretary, Mr. Bertram B. Moss.

NORTHERN COUNTIES FEDERATION.

THE quarterly meeting of the Board of Representatives of the Northern Counties Federation of Building Trade Employers was held at the Grand Hotel, Sunderland, Mr. Fred. W. Ranken, Sunderland, presiding. The President presented the report in connexion with the visit of the National Federation to Newcastle in July. He said the Northern Counties Federation were pleased with the arrangements for the entertainment of the visitors during the week of their visit, and on their behalf presented to the Secretary (Mr. W. H. Hope) a copy of Hobart's work on "Worcester China," and a cheque in acknowledgment of their appreciation of the way in which all the arrangements had been carried out in connexion with that visit.

The steps taken by the Sunderland Association with respect to the action of the Operative Joiners' Societies in relation to non-union men working for members of the Federation were reported upon. The matter had been referred for further consideration by the Sunderland Conciliation Board to the Northern Centres Board.

The proposed revision of clauses 20 and 28 of the national form of contract in use by the Royal Institute of British Architects and the proposed agreement for sub-contracts were referred to a sub-committee.

The Industrial Disputes Board proposed to be established at the instance of the Board of Trade was discussed. It was mentioned that Mr. J. W. White (Sunderland), the President of the National Federation, had been asked to serve on the Board.

Mr. Robert J. Huntley (Sunderland), was appointed an auditor in the place of the late Mr. J. C. Hope (Newcastle).

GENERAL BUILDING NEWS.

CHURCH ALTERATIONS, ABERDEEN.

Under the guidance of Sir Robert S. Lorimer, A.R.S.A., the interior of St. Andrew's Episcopal Church, Aberdeen, has been reconstructed at a cost of about 2,500. A feature of the alterations is the addition of a new chancel screen of oak, a memorial to the late Dean Danson. Mr. Findlay, Edinburgh, was clerk of works, and the contractors were as follows: Mason—Mr. George Hall, carpenters—Messrs R. & J. Reid; painters—Messrs G. Donald & Sons; plasterers—Messrs James Bamchoie & Sons; heating—Mr. Robert Findlay; electric engineers—The Electric Engineering Company, Ltd.; lacquering brass work—Mr. J. A. Connor; plumber and brass work—Messrs John Blaikie & Sons; carved oak work—Mr. Nathaniel Grieve and Messrs J. W. Clow Bros. (Edinburgh).

GIRLS' SCHOOL, WALTHAMSTOW.

Mr. Charles J. Dawson, F.R.I.B.A., is the architect of the new High School for Girls, Walthamstow, the cost of which will be about 11,500.

NEW PRINTING WORKS, BRUNSWICK-STREET, S.E.

The new printing works of Messrs. Richards, Clay & Sons, Ltd., Brunswick-street, Stamford-street, S.E., is a concrete structure. The total frontage is about 250 ft. and the depth of the side of the north end is 96 ft. and at the south end 41 ft. There are, including the basement, four floors on the same general plan, and a fifth floor comprising the dining-room, kitchen, etc. The architect was Mr. P. G. Collinson, F.R.I.B.A. Mr. Alexander Dwyer, M.Inst.C.E., acted as consulting engineer for the ferro-concrete construction, and Mr. Frank Broadbent, M.Inst.E.E., was responsible for the electric power and light installation. The building is fitted with up-to-date appliances including the latest available methods of electric driving machinery and lighting, fire protection, and heating and ventilating apparatus. The latter was installed by Messrs. C. Kite & Co., of 132, Euston-road, from the designs of their engineer, Mr. M. H. Skelt. Mr. H.V.E. consists of a mechanical system capable of delivering into the building 50,000 cubic ft. of filtered, cold, or warmed fresh air per minute, and maintaining the temperature at 65° Fahr. during the coldest weather, and cooling the building in very hot weather. In addition to satisfying the requirements as to temperature and ventilation, eliminating dust from the air, etc., it was desired to minimise as far as practicable the constructional or builders' work in connexion with the system, and to locate the apparatus in the most suitable position for it without occupying too much floor space. The heaters, air-washer or filter and an arrangement for moistening the air are placed centrally on the first floor at the base of the light well; fresh air is drawn from the light well through the filter and heater by means of two pairs of electrically-driven fans, one above and the other under the heater, supplying the top floors and the two lower floors respectively. This arrangement permits of equalising the resistance in the distributing shafting has all the advantages of central distribution, and an unrestricted supply of fresh air. The air is distributed about the building through galvanised-steel shafting having outlets at the height of 8 ft. above the floors and fitted with valves the main shafts are also fitted with valves placed near the connexion to fan outlets. The supply of fresh cold filtered air is controlled by means of louvre valves at the back of the filter and heater, and the apparatus can be prevented water from the filter being drawn into the heater chamber; return air-flues are arranged to permit of the air from each floor being roused if desired. The supply of air to the floor and the temperature can be regulated separately, and the apparatus can be used for one or more floors as required; by-pass valves are arranged on each side of the heater to allow of the passage, if necessary, of cold air to the fan chambers for mixing with the heated air or modifying the temperature.

BUILDING TRADE IN GLASGOW.

The Dean of Guild, Mr. Francis Henderson, at a sitting of the Dean of Guild Court recently, reviewed the business of the Court for the past year. He pointed out that great depression had marked the condition of the trades most closely connected with the work of the Court. The immediate outlook seemed to give no indication of improvement. Whilst during the past year the number of linings showed no material decrease, the valuation were less by 140,000, than in the preceding twelve months, and both as regards linings and valuation it was the lowest in the past twenty years.

ELECTRICITY POWER STATION, EGHAM.

The Lord Mayor of London, Sir T. Vazeux Strong, laid the foundation-stone recently of the station of the Egham and Staines Electricity Company. In designing the buildings the engineers associated themselves with Messrs. W. & G. Gray, architects, Egham. The building—which is of Georgian design—will be 75 ft. long, giving an engine room 55 ft. long by 30 ft. wide, with offices for the staff and general public.

TRADE NEWS.

The Kimbolton Council School, Hunts, has recently been fitted with one of D. O. Boyd's hygienic ventilating grates, supplied by Messrs. O'Brien, Thomas & Co., Upper Titchard-street, London, and Excelsior Works, South Bermondsey.

Under the direction of Messrs. Jeffery Lacey, architects, Ashford, the "Boyle" system of ventilation (natural), embracing

yle's latest patent "air-pump" ventilators
air inlets, has been applied to the Picture
lace, Ashford, Kent.

The Eldon Church Hall, County Durham, is
being ventilated by means of Shipland's patent
inlet roof ventilators and special inlet
ventilators supplied by Messrs. E. H. Shorland
Brother, Ltd., of Fallowfield, Manchester.
A three-light stained glass window has
been erected on the south side of Middle-
ton Church, Manchester. The work has been
designed and executed by Messrs. Percy Bacon
Brothers, of London. The central light of the
window contains the figure of Christ as the
saviour, with St. James and St. Leonard in
the side lights. The same firm have just
erected a stained glass window in Littleham
Church, Eymouth. The subject of the window,
rich consists of three lights, is the three
kings, the centre light contains a figure of
Blessed Virgin, with Mary Magdalene
on the left and the side lights.
The work has been carried out under the
superintendence of Mr. G. H. Fellowes Prynne.

LAW REPORTS.

Ancient Lights.

The case of Darby v. Matthews was heard in the Vacation Court a few days ago by Mr. Justice Lush.

It was an action, said Mr. Bramwell Davis, K.C., counsel for the plaintiff, for an injunction to restrain the defendant from interfering with his ancient lights. The plaintiff, ex-plaintiff counsel, was a doctor residing at "Dunwich," Station-road, Harrow. The defendant occupied the adjoining house, and was building at the back of the premises to within a few inches of the plaintiff's window. Defendant, however, said his wall had reached as high as he intended it to; but behind the wall defendant was proposing to erect a one-story building, and further down the garden a three-story building, which defendant asserted would not interfere with the plaintiff's lights. Plaintiff did not know how high defendant intended to carry the building of the wall, and if it went no higher the plaintiff would be satisfied. And as to the three-story building, plaintiff would accept an undertaking not to interfere with his ancient lights.

Counsel for the defendant was agreeable to give an undertaking. At the same time, he pointed out that the wall and one-story building would not affect the plaintiff at all. With regard to the three-story building, according to the plans made, that would fall behind the line of a former obstruction there.

Finally an undertaking was given not to interfere with the plaintiff's lights, and the matter allowed to stand over, the trial of the action to be expedited.

Reinstatement after Fire.

At the Guildhall, before Alderman Sir John Bell, Messrs. Franks & Simons, builders, Mile End-road, were summoned at the instance of Mr. John Todd, District Surveyor, for having commenced to do certain building works without serving him with a "building notice."

The facts were not in dispute, and the notice had been given since the issue of the summons. Mr. Todd said the work in question was the reinstatement of a building after fire. The house—No. 9, Hutchison-street, Houndsditch—was let out in tenements, and two lives were lost in a fire there recently. The staircase and upper floors were now being rebuilt, and such work came within the section requiring notice to be given to the Surveyor. The work itself was in contravention of the most useful provision of the Act, which aimed at the prevention of fire spreading from one building to another.

Mr. Richards (the clerk): You have not summoned them for that.

Mr. Todd replied that there was no penalty attached to that. There was a penalty for failing to give notice, because when the Surveyor had that he could take steps to prevent anything being done in contravention of the Act. He could, if necessary, apply for an order on a builder to take down any structure that was irregular.

The defendants' manager regretted that they had omitted to give notice.

Sir John: That's all very well. You are builders, and ought to know your responsibilities. I shall impose a fine of 20s. and 3s. costs.—Morning Advertiser.

OBITUARY.

Mr. J. Ammonier, R.I.

We regret to announce the death, on October 4, after an operation, of Mr. James Ammonier, of No. 142, Adelaide-road, N.W., in his eightieth year. A native of Camberwell, Mr. Ammonier was for many years employed as a designer by a firm of calico-printers. In 1870 he exhibited in the Royal Academy rooms, and became an original member of the Royal Institute of Painters in Water-Colours, though working chiefly in oils. The Chantry Trustees bought his picture, "The Black Mountains," in 1905, for 400 guineas, and in 1899, "Sheep Washing in Sussex," for 300l. Sir N. Mappin purchased "An Englishman's Cottage Home" (R.A. 1873); "The Silver Lining of the Cloud" and "When the Tide is Out" are in the Manchester Gallery. In 1876 the Council of the Royal Manchester Institution awarded the Heywood Gold Medal to his "Toilers of the Field."

Sir Charles B. Lawes-Witterwong, Bart.

Sir Charles Bennet Lawes-Witterwong, who succeeded his father, the eminent agriculturist, Sir John Lawes, first Baronet, of Rothamsted, Herts, in 1900, died, aged sixty-eight, at his country seat, on Friday last, after an operation for appendicitis. He was educated at Eton and Trinity College, Cambridge, proceeding B.A. in 1866. He then devoted himself to the art of sculpture, and had a studio in Chelsea Bridge-road. He executed the great group of "The Punishment of Dirce," contributed to the Franco-British Exhibition at Shepherd's Bush, and to the Fine Art Exhibition in Rome of this year. In March, 1909, he was elected President of the Royal Society of British Sculptors. Sir Charles, when at Eton and Cambridge, gained many distinctions on the river and the running-path. He married, in 1869, Miss Marie A. R. Fontaine; the title passes to his only child, John Bennet Fontaine.

Mr. C. T. Mason, M.Inst.C.E.

The late Mr. Clayton Turner Mason, I.S.O., who retired a few months ago as Collector of Customs, Western Australia, was born in 1847 at Tarrington, Co. Hereford. On leaving King Edward's School, Birmingham, he learned engineering; in 1874 he entered the railway department, Public Works, New South Wales, and ten years afterwards was appointed provisionally Director of Public Works and Commissioner of Railways, and member of the Legislative and Executive Councils. He then became General Manager of the Western Australian Railways; but in 1891 relinquished that post for the Collectorship of Customs.

PATENTS.

APPLICATIONS FOR PATENTS.

21,085 of 1910.—Robert Wadsworth: Tar-spraying machine.

21,598 of 1910.—Charles Wesley Gray and the British Stone and Marble Company, Ltd.: Glazing bars for skylights, windows, and the like.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from attention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the Editor or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiered Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted, unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.]

FACE DV COSTE DE LA COVR^E DE LHOTEL D'AVAVX A PARIS

The Hôtel Davaux, Paris. By Le Muet, circa 1640.

(From "A History of French Architecture, 1494 to 1661." By Professor Reginald Blomfield.)

FRENCH NEO-CLASSIC ARCHITECTURE.*

PROFESSOR REGINALD BLOMFELD, in his new book on "French Architecture from 1494 to 1661," elects to use the Neo-Classic in preference to the usual one, the Renaissance, and substitution at once indicates the attitude he takes up in regard to this brilliant architectural development. Without a doubt there is less justification for the use of the term Renaissance

in France than in Italy; the adoption of classic formulae was more conscious and deliberate than was the case south of the Alps. While in Italy the relatively weak mediæval tradition offered little obstacle to the rapid advance of the Humanistic ideals and all they brought in their train, in France the state of affairs was very different, as a most vigorous vernacular style was to be overthrown, mainly by the importation of ideas from abroad; and, although this overthrow may be regarded as part of the movement comprehending the entire

civilisation of the West, if we are considering it in respect of France alone the title Renaissance is not so expressive as one conveying less definitely the sense of revival.

Last month, in reviewing Mr. Ward's book that covers to some extent the same ground, we had occasion to consider the various systems possible in the arrangement of such a work.

Professor Blomfield adopts the biographical method to a much larger extent than Mr. Ward, and by this means, while sacrificing some advantages

* "A History of French Architecture, 1494 to 1661." By Professor Reginald Blomfield, A.R.A., M.A., F.S.A. 5 vols., quarto. 50s. G. Bell & Sons, Ltd.

The Tuileries: Philibert de l'Orme, circa 1564.

of value in the use of his work as a text-book, secures an impression of continuity and enlists our interest more in respect of the development of the personality of the architect.

It is easy to see that this development is a point that has struck and held the author as one of the salient features in the change from mediæval to "Neo-Classical"; he has devoted considerable research to the question of the actual part borne by those in control of building operations when the Italian influence began to be felt, and his verdict is that they were not architects in the present acceptance of the term. The method by which the great architectural works of the Middle Ages were produced is touched on, but this investigation is far too important and comprehensive in itself to admit of more than a passing reference. The author passes on to the consideration of the extent to which the Italian craftsmen settled in France influenced the architecture of the earlier developments, and comes to the conclusion that this influence was more marked in the direction of decorative detail, and that the general design owed

more to the advanced spirits among the Frenchmen than to the Italians drawn to France by Francis I.

Taking up the story at the death of this Monarch, we find Professor Blomfield giving full credit to Philibert de l'Orme and to Jean Bullant for the important advances in architectural style they achieved, but we cannot but feel that he is hardly fair to the former in the comparison between the works of the two. Both were gifted with a strong imaginative faculty, and both were working in a manner then imperfectly understood; it was inevitable, therefore, that both should fall into error at times, but, while those of De l'Orme are severely criticised, Bullant is treated more gently. Of course, while it is impossible for an architect not to feel a certain personal sympathy for one attitude of mind rather than another, it seems to us that, brilliant though the work of Bullant is, his errors of taste detract more from his conceptions than do those of De l'Orme, and that in exalting the one at the expense of the other Professor Blomfield has hardly given due weight to this aspect.

Again, in the matter of Lescot and Goujon a strong line is taken as to Lescot's share in the inception of the designs due to the association of the two. Whether the author is entirely justified in his contentions or not (and he certainly makes out a strong case), such an investigation as this, involving a careful consideration of architectural qualities, must be of undoubted value.

In summing up the contents of Volume I. which carries the reader to the latter part of the XVIth century, the author refers to the systematising of building methods and the emergence of the professional architect in the following terms:—

"The advance made in this second period that is, in the years between the death of François I. and the death of Henri III., was on the whole considerable. In the first place the architect had definitely established his status as an artist in building, a man whom it was desirable to employ in all important work, and, at all events in the case of the architect of the King, an official who ranked comparatively high in the Court hierarchy. The conditions of practice were not far removed from those of the present day; there was the architect who prepared designs and models, and the Devis or specification of works; the builder such as Guillaum, or Le Breton, or Chambige, who tendered for the work and submitted his schedule of prices; lastly, there were the master tradesmen, masons, carpenters, and the like, the "jurés," men who were qualified by full membership of the Guilds, and who were formally appointed to examine the work and report on oath whether as carried out it complied with the contract, to a certain extent occupying a position halfway between that of the architect and the modern quantity surveyor. The scope of the architect's work was thus defined for the first time, and his training became more thorough and systematic. It is clear from De l'Orme's treatise that it included geometry and mathematics and the study of materials on the one hand, and on the other fairly extensive researches into the antiquities of Rome, either on the spot or in the text-books of the time."

At the beginning of the XVIIth century an important revival in church building, in part due to the rise of the Jesuits and in part to a general religious movement, gave additional opportunities to the architects of that period. While the more advanced work was in the XVIth century limited to civil buildings, in the following one the activity was shared by the church, as Lemercier, F. Mansart, and other architects carried out churches showing a high level of architectural accomplishment.

The author deals in detail with these among the works of their respective designers, and we must step back to the reign of Henri IV. As soon as this King had remedied the disorganised condition of the realm, he turned his attention to building, and earns Professor Blomfield's praise for his appreciation of architecture as a factor of national civilisation:—

"Partly owing to the absence of materials, and still more to the erroneous tendency to identify the French Renaissance with François I., the importance of what Henri IV. did to advance French architecture has been much underrated. François I. was also an enthusiastic patron of the arts, but he seems to have been unable to consider art as a whole, and in its relation to the social and political life of his countrymen. The active personal part that he took in the direction of his artists in no way compensated for this failure in large ideas; it was, indeed, as I have already pointed out, actually injurious to the progress of the arts. The rôle of the intelligent ruler is not to interfere with artists in the details of their art, but to find the

opportunity and elbow-room, to stimulate the intellectual atmosphere in which they work; to apply wisely the resources of the state to their encouragement and support. It was to this great task, among many others, that Henri IV. devoted himself, and it was in this way that he laid the foundations of all that has been most vital in France in the relations of the modern state to the arts."

That this is the right position for the expert in statesmanship may be admitted, but that it will necessarily produce fine architecture must not be inferred for the moment. The author seems to imply that it will, but further on we read that

"Though exceptions may be found, and in spite of the splendid efforts of Henri IV. to promote the art, architecture generally was at a rather low ebb in the reign of Henri IV. It had not yet had time to get into its stride, and it was still confused by the technical legacies of the XVIth century. At its best it produced that simple and straightforward manner of domestic architecture in brick and stone, such as I have noted at Fontainebleau, which drew its charm from its materials, and from a certain austerity and reticence of design. At its worst, and its worst is more plentiful than its best, the architecture of this period ran out into all sorts of ambitious extravagance, piling detail upon detail, and over-accentuating the architectural motives that it used. Except that it was more skillful, there is little to choose between this architecture and our own Jacobean. Both manners are a travesty of the classic that they set out to realise. They had lost the charm, the picturesqueness, the reasonableness of earlier work, of the Manoir d'Ango in France, of Compton Winyates in England, and they were separated by a deep gulf from that genuine interpretation of the Neo-Classic spirit which Inigo Jones was to introduce into England, and François Mansart into France. The period was still one of transition, and must be criticised from that point of view. But throughout this period both architects and workmen were gaining technical ability, and out of all this welter of experiment and failure a finer taste

Loggia, Montgomery Ducey. Style of Henri IV.

The Chateau of Chiverny, 1634.

Hôtel de Limier, Vannes. Style of Henri IV.

and more perfect insight into the function of architecture were slowly emerging. The younger generation were to profit by the failures of their elders."

Certainly soon after this French architecture made great strides, and justifies the statement that the Frenchmen of the latter part of the XVIIth century displayed a faculty of imaginative foresight, a power of organic design, that enabled them to bring the whole of their resources together into one great and cumulative impact on the emotions.

While the author very justly points out that this important quality of architecture has been unduly neglected since that time, we think he ought in fairness to recognise that it has been the dominant note in the teachings of the Ecole des Beaux-Arts up to the present day, and that, while his criticism applies with great force to English architecture, the same can hardly be said of other nations.

Throughout the second volume we meet from time to time illuminating

quotations from the writings of Blondel; these are so apt and to the point that we cannot be too grateful to Professor Blomfield for their inclusion, and must express our agreement with his view that the opinions of this author are of the utmost value in a systematic study of the technique of architecture.

Throughout the book the illustrations are most judiciously selected to convey a clear and well-proportioned impression of the works of various periods. They comprise many reproductions from the works of Du Cerceau and other contemporary illustrations, from sketches by the author, and from well-chosen photographs. Those we give are selected as typical of each of these and exhibit work of various periods.

The author hints that he may continue his studies through the century or so following the period dealt with in these volumes, and we shall trust to see at some future time the results of the continuation of his work in this direction.

THE AUSTRALIAN CAPITAL COMPETITION.

WE regret to hear that the Government of the Commonwealth of Australia is reported to have declined to agree to the proposals of the Royal Institute of British Architects that a more adequate jury of assessors should be provided for the competition of the new Capital City.

The Government proposed to appoint a committee of three Australian experts—an architect, an engineer, and a land surveyor—to advise the Minister who is himself to make the final selection. To this the Institute offered objections and suggested that it would be more in accordance with the importance of the occasion if a jury of three prominent town planners was elected—one by the Australian Society, one by the Institute, and one by the American Institute.

If we are correctly informed, the Government has now slightly modified its

original proposals by agreeing that the nomination of the three experts shall rest with the societies of their respective professions in Australia, and not with the Government.

This concession is probably due to the representations of the local societies, and, though it is good as far as it goes, it is hardly to be said that it meets the objections or in any way attains the object of the proposals of the Institute.

The Australian Government claims the Australian Board of Judges will be fair and impartial, and that British competitors should rest content with that assurance. This is to beg the question. No one doubts their impartiality. We trust we shall not offend Australian susceptibilities if we suggest that town planning is not just the one thing for which the country is famous, and that we have no guarantee that a purely local tribunal will obtain the confidence of the best European and American experts.

The Australian Minister for Home Affairs is reported to have expressed the view that town planning comprises three professions—engineering, surveying, and architecture.

This may be a good rough-and-ready definition with an element of truth in it, but it would not do to assume that by taking a specimen of each profession the result would be one composite town planner. This seems to be the difficulty. However expert the Australians may be, and no doubt are, in these various professions, unless they have men who have made a special study of the subject, and are capable of holding their own with the best authorities in Europe and America, they cannot inspire confidence outside Australia. If this competition is to be a success the tribunal of judges must be men of the very first standing as expert town planners, and not merely as competent members of any one of the professions which that term includes. It is obvious that a man may be most accomplished in any of these, but have given no thought to the combination and the relation of the various activities which go to make up the subject.

The same Minister is also reported to have said that, "while the aristocracy of the profession may not send designs, there are hundreds of young, progressive, and up-to-date professional men who will compete. They have reputations to make."

On this we have two comments to make—first, that he appears to prefer to run the risk of keeping out the best designs and of having to be content with the second best, rather than alter his ill-considered conditions; and, secondly, that such a cynical appeal to professional disloyalty is not worthy of one in his position. He may be right in his conjecture, though we prefer not to believe so. But in any event it is more than curious that a responsible Minister should be found to publicly reckon on disloyalty, and to admit that it is necessary to the success of his measures.

There must be something wrong when the successful result of so important an undertaking depends on the willingness of competitors to sacrifice their self-respect for professional advancement, and there must be something wrong with a country where such things are possible.

NOTES.

The Duke of Rutland and our Ancient Monuments.

THE recent movement for the protection of our ancient monuments has provoked an indignant protest from the Duke of Rutland, whose plea is in brief, "May not a man do what he likes with his own?" The noble Duke proceeds to explain to us that the unfortunate owners of works of art are now compelled to sell them in order to meet the exceptional demands made on their estates by the financial policy of the present Government, and he lays the blame at their door. The Duke, as a Tory of the old school, is naturally bitterly opposed to the present Government and all its works, but surely he stretches his argument a long way in making them responsible for the sale of works of art. The operations of the Finance Act have not so far put such a severe pressure on the land magnates as he suggests, and do not appear at all likely to impose burdens that cannot be met by deals in ordinary property other than that of special archaeological and artistic interest. The Duke appears to resent the idea that anyone should have the power to review his decisions as to alterations or improvements at Haddon Hall, for example. In such a case as this, where an owner is obviously interested in the preservation of his property

it is unlikely that interference would be needed, but an attempt to determine general principles from a special, and quite possibly exceptional, state of affairs is misleading and absurd. The Duke's letter to the *Times* rather suggests that he is in a bad temper with the nation and its Government, and more concerned with his own grievances than with the broad constitutional issue as to what is right for the community as a whole.

Portinscale Bridge.

AS THE question of a new Portinscale Bridge is not finally decided, we may venture to hope that the existing bridge may yet be preserved in its integrity. The proposal now before the County Council is that a new bridge, which it is claimed would be more in accordance with the needs of modern traffic, is to be built at a distance of 50 yds. from the existing one. While, without inspecting each particular site, it is difficult to say whether it is the best that could be found with regard to the preservation of the general character of a view, we are in accord with the principle that a slight road diversion and a new bridge are often no more costly than the destructive method of rebuilding or remodelling a fine old bridge, with the result that, in most instances, it is deprived of both its archaeological value and its artistic charm. In this case, however, we have

St. Pierre, Saumur: Centre and Upper Portion, Early XVIIIth Century.

(From Professor Blomfield's "History of French Architecture.")

the authority of Canon Rawnsley against such a course, and when he states that the new bridge would blot out the view of the old, it appears evident that the proposal does not meet the artistic requirements, and in view of the fact that the bridge can be restored by the grouting process, and is generally adequate for the present traffic needs, as is testified by the opinion of the Royal Automobile Club, we trust that the present proposals may be reconsidered.

Forestry in India.

THE intimate connexion between forestry and building justifies us in drawing attention to the fact that the Indian Government, in addition to their proposed abolition of the office of Director-General of Archaeology referred to in our last issue, also intend to abolish the post of Inspector-General of Forests. As Sir Herbert Maxwell points out in the *Times*, it is curious that at a time when the Home Government is giving increased attention to these two questions that of India is scrapping its hitherto efficient administrative machinery and is generally pursuing a retrograde policy. The importance to India of a good system of forestry is too great to allow of any slackening in the methods of organisation and control without seriously diminishing the economic efficiency of this industry.

Painters and Lead Poisoning.

THE question of white-lead poisoning in the painting trade has again arisen owing to the fact that the disease appears to be increasing in frequency. Opinions differ as to whether it can be efficiently guarded against by the use of indiarubber gloves, overalls, and respirators, but even where these are provided it is often difficult to ensure their constant employment. Taking these facts into consideration, the only remedy seems to be the substitution of some other paint-body for white-lead, as has been done in France, and is now under the consideration of a Committee appointed by the Home Secretary. It may be admitted that no other substance is quite equal to white-lead as a body, but this cannot be allowed to outweigh the risk to the painter of contracting a terrible disease. It seems to be proved that even the most careful and cleanly workmen are exposed to risk, and if this is confirmed by the investigations of the Committee white-lead will have to go.

Canterbury Cathedral.

THE issue of a further appeal for 10,000*l.* to complete the task of reparation at Canterbury Cathedral draws our attention to the fact that, after the most strenuous efforts on the part of the Dean and Chapter, the central and north-western towers have been put into a sound and secure condition. There yet remains the south-western tower, commenced by Archbishop Chicheley, in the reign of Henry V., which is also in a grievous need of reparation. The pinnacles have had to be taken down, and an advance from the bank has enabled a scaffolding to be erected. We feel that it will be disgraceful if the necessary funds are not forthcoming to enable our premier cathedral to be put in a state of decent repair and structural soundness.

PICTURE EXHIBITIONS.

WE are glad to notice that at the galleries of the Fine Art Society some of the members of the Modern Society of Portrait Painters have sent a selection of their preliminary sketches. This is a move in the right direction, even if the result, with the exception, perhaps, of Mr. Lambert's drawings, were a little disappointing. We know artists who do not confess to preliminary sketches, and it is not our business to ask a painter to explain the processes by which he arrives at a given result. The result is the main thing. But every critical frequenter of painters' studios knows that there are instances in which the final accomplishment of a series of studies has fallen short of the studies themselves in vital artistic interest. In the completed picture the spirit, distinct enough in the first notes, has departed. Therefore it is that we welcome such pleasant little supplementary adjuncts to the main exhibition which we find at the Fine Art Society.

The impression which the exhibitions of the Royal Institute of Oil Painters and the Royal Society of British Artists leaves with us (with certain modifications) is one very little removed from dullness. We do not always ask for a sparkling experimental sort of show (although we are not indifferent to this type); we can discover even a certain charm in the works of the worst periods of Victorian art, because it was at bottom sincere and it reflected the spirit of the time. But what of the spirit behind the vast majority of the pictures at these two exhibitions? Is it sincere, does it reflect the spirit of the time? If it is sincere, then it suggests a very limited, unimpressible intelligence. If it is not sincere, then it is pure "pot boiling." Each of the three exhibitions has its bright spots; they contain here and there other pictures—pictures with mind and individual talent behind them.

Among these must be counted Mr. Dudley Hardy's imaginative Eastern subjects at the Royal Institute of Oil Painters, singularly rich in deep tones of colour, in mysterious shadows with sparkling notes of illumination, which evoke pretty much the sort of sentiment, both in drama and pictorial spectacle, as the tales of the "Thousand and One Nights." Mr. Hardy's art would seem during later years to have steadily advanced in seriousness and capacity. Then there is the work of Mr. Reginald Frampton, who never seems to permit himself to make any concessions to his pre-Raphaelite ideal. It is indeed almost a strange thing to see pictures, so honestly realised, of the type of his triptych, "A Madonna of Brittany," and "The Birth of Perseus," in a modern gallery. Mr. Frampton's palette is largely the palette of Puvion de Chavannes, not so much in the choice of colour, perhaps, as in his apprehension of its use in a certain poetic delicacy of tone. He also recalls the Frenchman in the touches of personal observation which assist a symbolic intention. Take, for instance, the modelling of the hands in the "Madonna of Brittany." This picture, as well as his larger canvas, suggests a decorative quality which is sufficiently rare in modern work to claim attention. It is a far stretch from Mr. Frampton to Mr. Lavery. Mr. Lavery is a great experimentalist; he diagnoses the latest things in technique, in method, and he gives his lively intelligence and skill full play. His "study" at the present exhibition for his large picture, "The Amazon," which was shown at the last Academy, might supply a useful primer of commentary on the effect of the juxtaposition of colours and the refraction of light, somewhat after the manner of the Bernard school. Miss Gloag's two pictures, "The Green Parrot" and "1860," are as daring and original, either in colour or subject, as ever; and Mrs. Betty Fagam, while touching an obvious note of sentiment, has presented a version of the oft-told tale after her own fashion, and effectively. Mr. George Hart,

Mr. Niels Lund, Mr. A. D. McCormick, and Mr. Lee Hankey are among those who contribute other works of interest.

The President of the Royal Society of British Artists, Sir Alfred East, is represented by only one picture, which cannot be ranked among his best; and the exhibition as a whole is a little disappointing. Mr. Alfred Hartley's "Silvery Night" provides an attractive effect of a dark cloud racing past the moon, and Mr. D. Murray Smith's landscapes, wrought in his sedately formalistic manner, have a constructional quality which is shared by "The White Ensign" of Mr. A. H. Elphinstone. "Summer," by Mr. Joseph Simpson, is a lively arrangement in colour, crisply impressionistic. Mr. A. E. Henderson, in his "Arch of Titus," is responsible for the only architectural drawing of any real excellence which we have observed at the present exhibitions. His "Restoration of the Temple of Artemis," in collaboration with Mr. Gilbert Bayes, is at the head of the staircase; it was reproduced in the *Builder*, August 4, 1911.

TOWN PLANNING.

A COMBINED ordinary general and Camera, Sketch, and Debate Club meeting of the Architectural Association was held on Monday at Tufston-street, Westminster, S.W., Mr. Gerald C. Horsley, President, in the chair.

Mr. H. A. Hall, Hon. Secretary, announced that the next meeting of the Camera, Sketch, and Debate Club would be held on November 2 at 7.30 p.m. (Ladies' Night), when a paper by Mr. Edwin Gunn, A.R.I.B.A., entitled "Woman as a Domestic Architect," would be read.

He also announced that the Athletic Club annual general meeting would be held on October 24 at 6.30 p.m.

New Members.

The following gentlemen were then elected as members:—

F. G. Bartholomew, London	M. D. N. Kochi, Holborn, W.C.
E. B. Bird, Clapham Common	F. W. Mackenzie, Seven Kings
C. J. Brooks, London	C. McLachlan, London
T. D. Brown, London	H. A. N. Medd, Abingdon, Berks
A. S. Burnett, Shawford, Hampshire	A. B. Meldrum, Holborn, W.C.
G. Capon, Nunhead	H. E. Napier, Notting Hill, W.
J. C. Crawford, Cheltenham	H. L. Peck, Stockwell, S.W.
New Zealand	W. R. Richardson, London
H. Crome, Hove, Sussex	H. A. Ryan, London
T. C. Evans, Fulham, S.W.	L. H. Saxe, Chelmsford, Essex
G. F. Finnemore, Northwood, Middx.	A. E. Tozer, Highgate, N.
W. A. S. Forbes, Newlyn, Penzance	W. Wands, Harlesdon, N.W.
P. M. Fraser, London	M. T. Waterhouse, Boxmoor, Herts
B. George, Wood Green	A. Waterlow, Hampstead, N.W.
H. F. Gossling, S. Croydon	J. H. L. Whentley, St. Leonard-on-Sea
R. H. Gutteridge, London	J. G. Williams, Bristol
C. F. N. Harris, Putney, S.W.	A. P. Woodin, Streatham Park
A. W. Horton, Derby	
G. S. Kossing, London	

Mr. A. E. Richardson and Mr. C. L. Gill having been reinstated as members, the

President proposed a vote of thanks to Miss Choll for presenting to the A.A.A. two model plans and some pieces of medieval woodwork and ironwork. This having been agreed to, the President nominated Mr. F. C. Eden to fill the vacancy on the Council.

Mr. Arthur Keen proposed the adoption of a Balance Sheet and Council's Report for the year 1910-1911.

Mr. Curtis Green seconded, and after some discussion and the passing of a vote of thanks to Mr. D. G. Driver, Secretary, and the motion was moved by Mr. G. E. Nield, the motion was agreed to.

Mr. Raymond Unwin then read a paper entitled

TOWN PLANNING: FORMAL OR IRREGULAR?

"The subject of the discussion which you have done me the honour of asking me to open tonight is one both deep in significance, for it goes to the root of all town-planning design, and difficult of solution, for it opens up the whole problem of convention in art, as to which a controversy as old as art criticism has waged every form of design from portrait painting to gardening. I am not qualified to deal conclusively with so wide a subject, nor

I feel able to put before you a simple theory of either the formal or the irregular town planning, which perhaps might have been the easiest way to open a discussion. If I were to interpret the two views in such terms as some of the extremists on each side make use of, it would be fairly easy to put a strong case against either party. Those who say that the town plan should consist entirely of straight streets and square places symmetrically arranged upon an axial line, pretty obviously ignore both the economic necessities and the best architectural opportunities which spring from the fact that the site upon which the plan is to be carried out has in England, in nine cases out of ten, an undulating surface, and contains many marked features of an irregular character. On the other hand, those who maintain that because the site consists of hills and hollows, and is marked by winding streams and devious highways, uplands with ragged edges, and the undom boundary lines of private properties, it is therefore unnatural and out of harmony with the site to plan straight streets or lay out symmetrical groups of buildings, seem to neglect altogether the legitimate function of human design and the application of architectural principles natural to a work so intimately connected with architectural expression as that of town planning.

Unless the extreme formalist is prepared to depend upon gigantic feats of engineering to provide for him a sufficiently formal stage for the display of his design, however formal he may make it on the paper plan, many sites will play pranks with the lines of his elevations. In fact, we cannot, if we are to obtain any success, think of town planning as the creation of a pattern in two dimensions, but must necessarily think of it in three. The formalist will admit that on an undulating surface many of his straight lines will always be seen as curves, and I cannot conceive any valid reason why he should not curve his lines on plan if he is so doing he can secure a horizontal line for his elevation; a matter which may be of vital importance to the formal effect he aims to produce.

This line of argument seems to give an opening to the advocate of the irregular school to come along and say: "What is this formalism and symmetry, anyway? Is it anything but mere conventional rule to make it easy for mere imaginative mind to produce harmless designs? What possible justification is there for limiting the design to the symmetrical, the straight, or the square?" He has studied the lines which have pleased him in the world round, the sweep of the seashore, the outline of the mountain slope, and the subtle forms of waves and flowers. As seen foreshortened in their natural state, and has found no formality. True he must admit some degree of symmetry in the balancing of parts of the bodies of men and animals, but he will urge that this is always associated with an extreme degree of subtle modelling and with some inexactitude; and that the symmetry of the bodily form, except perhaps when laid out in death, is always modified by the want of symmetry of the pose in which it is seen.

If, on the strength of this, he argues, "Why should I not have for my design the same

freedom that I see in these forms around me?"

I am not sure whether here we have not stumbled on the essential fallacy of this point of view, the idea that the free exercise of fancy uncontrolled by any precision of purpose or law of proportion is the natural basis for the highest type of design in all branches of human activity. John Ruskin is not accepted nowadays as a safe guide in all matters of architectural art, but I should like to quote what he says about that idea of liberty which regards it as meaning the right to do what we like. He says:—

"Nor is it the least among the sources of more serious satisfaction which I have found in the pursuit of a subject that at first appeared to bear but slightly on the grave interests of mankind, that the conditions of material perfection which it leads me in conclusion to consider furnish a strange proof how false is the conception, how frantic the pursuit of that treacherous phantom which men call liberty: most treacherous, indeed, of all phantoms, for the feeblest ray of reason might surely show us that not only its attainment, but its being was impossible. There is no such thing in the universe. There can never be. The stars have it not, the earth has it not, the sea has it not, and we men have the mockery and semblance of it only for our heaviest punishment."

I would like further to suggest that in the alternative definition, first given, I believe, by James Hinton, "that liberty is the power to like what we may do," will be found some reply to the extreme formalist. Certainly a good deal of what may be seen of informal town planning and *art nouveau* architecture does support the view that in the studied irregularities the designers are parodying the lines of a nature which they do not understand, and caricaturing a type of beauty which their art is incapable of creating. But because of this, to maintain that no one is competent to compose, either in the form of buildings or in the field of town planning on asymmetrical lines, that the beauties of proportion and relation can only be displayed when axially planned, seems to me a proposition which is amply disproved by many of the most beautiful buildings, streets, and places which have resulted from the work of the greatest periods of the past.

But our discussion is approaching the most unprofitable point of trying to decide one of those never-to-be-settled problems as to how far we may sway towards one view or another, the extreme and logical outcome of each of which we feel to be unsatisfactory. To avoid this danger I suggest that we try to approach the subject from another point of view. Past generations have not been able to solve the problem on these lines. It is hardly likely that we shall do so to-night, but if we can by discussing it help one another to see more clearly what should guide us we may glean some practical good from the discussion.

What is town planning? What constitutes it an art, and what limitations must artistic expression through this medium accept?

Town planning consists in making provision for the needs and affording satisfaction for the aspirations of an organised community. It is its purpose to minister to the convenience of the inhabitants, to increase the efficiency of their associated industrial and commercial activities, to foster their social intercourse and their intellectual development by the facilities which it affords, and to add to the pleasure of their lives by preserving the amenities of the town as a place of residence. This is, in mere outline, the useful function which town planning must fulfil. The very expression of some of its purposes would constitute town planning an art, and it is impossible, as in the kindred art of architecture, to draw any precise line between the useful purpose and the beauty of the form adopted to satisfy that purpose, the two being intermingled. If properly appreciated both by the citizen and the artist these two aspects of the subject are not antagonistic, but they may become antagonistic if the artist forgets the purpose of that which he is creating and imagines that it is his duty to create something beautiful which the citizens may with an effort make use of, instead of creating something useful and expressing it in a beautiful form.

Here at once we meet with definite limitations of a practical nature within which the designer must work. It may be true that the steep, straight street leading over the top of the hill would make an excellent basis for a formal scheme, but if every cyclist has to dismount and push his machine up that hill, and every

driver to walk his horse with difficulty down the other side, the purpose of convenient access will hardly have been satisfied, and any beauty which the design may have will be rendered unpleasing by its obvious want of suitability to its proper purpose. We see, therefore, that our plan, whatever its form, must properly satisfy the requirements of use, and must be adapted to the nature of the site. These may be taken as two cardinal principles of successful town planning design, principles which are sufficiently important to override any mere question of formality of plan when they are antagonistic to it. Though these practical considerations will often be irreconcilable with some preconceived formal scheme, it is not often that they will be antagonistic to all forms of beautiful expression. Much has been written on the relation between use and beauty, and I must not wander off into a discussion on this point. Suffice it to say that in town planning, at any rate, beauty is intimately associated with use, with fitness for purpose and function, but it is not the same thing. It is not enough to satisfy the use and trust that by chance beauty will result. Use and fitness will dictate certain lines of development, but it is seldom that these will be exact lines; rather they will usually be limits of deviation, and it is within those limits which the useful purpose allows that the town planner must keep, and it is of the scope which they afford him that he must take advantage to produce the beauty of form at which he is aiming.

But not only are there limitations due to the useful purposes of town planning, there are, as in other arts, limitations due to the medium.

First of all, this art is not complete in itself. The town planner but lays down the general design, creates the opportunities. He must depend upon the architects who come after him to fill in the details and take advantage of the opportunities he has created. He will be able to a greater or less extent to influence the result by determining the position of main buildings, and sometimes by fixing frontage lines and limiting the height and character of the buildings, but at best he must leave all detail out of his count; he can deal only with the main masses. It is by the handling of these masses of building and the disposition of the spaces or voids between them, by bringing all the masses and spaces into proportion with each other, and the whole into proper relation to the site so as to produce an organic composition, and by this alone, that town planning can speak, can produce its effect. It is by this completeness of the organic composition also that town planning gives expression to the ideas of corporate activity, civic association, and human fellowship, a range of ideas which can hardly, with equal adequacy, be expressed in any other way.

If that be so, then our artistic aim proves true when brought to the test which Mr. Reginald Blomfield has well suggested when he says: "This is, I think, the vital touchstone of any art that what it does can only be done by that one particular art."

Anything, then, which contributes to the force and clearness of this expression of the organic unity of the city must be proper to the practice of this art, while anything that detracts from or blurs this expression must be improper. It is by appealing to the sense of correlation which springs from spacing and proportion, to the sense of unity which springs from definitely apprehended form, whether in plan by the disposition of the parts upon a level plain, or in elevation by the piling of them up upon the hillside, that alone we can produce this, our highest form of expression. We are seeking definiteness of form; it can hardly be right to take informality or irregularity as our means.

To sum up, I believe, then, that town planning should be formal, using the word in a broad sense and always remembering that there are limits set by the useful purposes that the plan must provide for, by the nature and opportunities afforded by the site, and by the relation of the beholder to the city which he views, all of which will very often cause the essential effects to depend upon a formalism which does not hesitate to depart from exact regularity on the paper plan, when by doing so more adequate expression can be given to some element of the design more essential to the complete unity of the result than the element of formality.

May I now attempt to illustrate what I have said by showing you some examples?"

In conclusion Mr. Raymond Unwin showed some interesting lantern views in illustration of his remarks.

Mr. Stanley C. Ramsey

said he was afraid he must plead guilty to being a formalist of the worst description, and after seeing and comparing the interesting slides they had seen and listening to Mr. Unwin's remarks on them he had come to the conclusion that Mr. Unwin was a greater formalist than his paper might lead them to believe. In Mr. Unwin's reference to a formalist as one who starts with a preconceived scheme without reference to the special requirements and conditions of site and surrounding scenery, which he illustrated by reference to an imaginary plan of a site for a town on a hill, in which the main road was taken in a straight line up one side and down the other—when possibly the better solution would have been to have made a circuitous approach—he was only giving a picture of one who had approached his problem with a very inadequate conception of what he had to do. This surely was a very immature and incomplete representation of what a formalist in town planning should be. One might as well refer to a classic architect as one who designs a symmetrical façade without any relation to the building behind it. All the greatest formalists who had been masters in town planning had shown their mastery by that very grasp of the difficulties to be overcome which Mr. Unwin would have them think it was their special privilege to ignore. In fact, many of the slides that they had seen on the screen only proved his (the speaker's) statements; and, to take an example that they were all familiar with, he need only instance Regent-street as it existed ten years or so ago, before the present devastation had commenced, as a satisfactory solution of the application of formal principles to town planning. In the lower part we had an instance of formal architecture arranged on a steep gradient with a termination in Waterloo-place and a vista effect terminated by a climax in the Duke of York's Column. The upper and the lower parts were connected by Piccadilly-circus, and the upper part of Regent-street was a formal treatment of a street on a curve on rising ground, finishing at Oxford-circus, with the church at the end of Langham-place in the distance giving another vista effect. And the treatment of the whole formed a very good example of the application of formal principles applied to the difficult problems of curved streets and steep gradients. He thought that before we could properly decide the merits of regular or irregular town planning we must have a clear idea as to what was meant by the two terms, and he ventured to submit the following definitions:—

1. Regular, that which had been planned to a preconceived system laid out on regular and orderly lines.

2. Irregular, that which had been built up unit by unit—being part of no complete scheme—controlled only by immediate requirements.

Proceeding to the different types of town, we find that they come under one or other of the above heads, and might for the sake of convenience be divided into three distinct classes:—

(1) Towns or cities that had from the first been laid out on regular and orderly lines, such as modern Paris, following the plans by Gabriel and the earlier architects of Louis XIV., and afterwards those of Haussmann; Washington, built on the plans laid down by L'Enfant; and the new town of Edinburgh, which was planned by Craig; and many of the colonial cities of Greece and Rome.

(2) Towns or cities that had grown fitfully, uncontrolled, or only partially controlled. Examples of this type would be found in ancient Rome and Athens and most mediæval cities. The Greeks and Romans both realised the shortcomings of their capital cities, which were the gradual development of earlier and prehistoric times, and in the design of their colonial cities followed a definite and pre-arranged plan. Rome was unity itself in the lay-out of her forum, baths, public places, and individual buildings, and was unsymmetrical only in the connexion of her different parts. Examples

of the colonial cities of Greece laid out on formal lines might be found at Miletus, Priene, and Rhodes, the last-named being the work of the Greek architect Hippodamus. Remains of Roman colonial cities of a formal type might be found at Treves, Silchester, and Timgad.

As to the third and last type:—

(3) Towns or cities that were a combination of the two previous types, owing their formation partly to growth and partly to predetermined planning. Most of our modern towns in this country would come under this description *i.e.*, London, Dublin, Glasgow, Bath, Ramsgate, Margate, Hastings, and Brighton. It was only now that we realised the loss London had sustained in the setting aside of Wren's plan for its reconstruction after the Great Fire—a fine example of formal planning, which took into consideration all the difficulties of site and environment, and which in its treatment of difficult gradients, awkward connexions, vista effects, and axiality of planning, with its ample provision for traffic, immediate and future, showed the mind of a master. When we contrast the confusion of the central districts with the subsequent development of the western and south-western quarters we must of necessity admit the advantages of some orderly arrangement in the lay-out of a great city. The district between Oxford-street and Marylebone, with its fine series of residential squares stretching from Bloomsbury to Bayswater, and including as it does such magnificent examples of town planning as Cavendish-square, Portman-square, Portland-place, Regent's Park, and Regent-street, together with their connexions of rectangular and carefully placed streets, could not fail to impress the least observant or to influence the most confirmed informalist. Much of this work was carried out in the early years of the XIXth century, and owed its inspiration and direction to such men as the Adams, Decimus Burton, Nash, and Bassevi, and, together with that quarter which was known as Belgravia, helped to make London the beautiful and dignified city that it is. We thus find that in ancient and modern times there has always been a desire for the formal, and wherever possible town planning has always developed on these lines—no town of any importance has ever been deliberately laid out on any but regular and orderly lines. In seeking, then, for a solution of modern problems in examples of a formal kind, we must balance up the advantages to be obtained by following a controlled and prearranged plan over the disadvantages that resulted when the town was the outcome of an uncontrolled or disorderly growth. In a mediæval city, the charm and fascination of which were undeniable, the artistic results had been in most cases due to accident; if there had been any guiding principle it had been only the selection of the site for the most important building, such as the cathedral or monastery, and round these had grouped the habitations and different units which had formed the town, with results at times the most striking. The danger was when we attempted to reproduce a picturesque result by studied means—the result would be something very different to that which we desired. The correct setting for a cottage or house of the Middle Ages (apart from those in the open country or small villages) was in the narrow streets of a mediæval town, where the effect was nearly always obtained by a close juxtaposition of similar buildings, and which were viewed sideways as approached up the street. The result of overhanging story, deep eaves, rough-hewn beams, and crowded tile roofs was harmonious, and the individual design of the different units composed into a complete picture. But take such a street and put it on the side of a broad road or tree-lined boulevard, after having in each building made an effort to combine modern proportions and modern comforts with old-world effects, and we should be extremely disappointed with our work. Seen in their new setting or viewed as a façade, we find each house competes with its neighbours; there is a want of rest, of uniformity. The result is distressingly original or abnormally picturesque, and this, in conjunction with the strained and unnatural appearance caused by the introduction of modern requirements in the way of light and height, for instance, produces a sensation of dissatis-

faction and uneasiness. This is one of the unfortunate tendencies of some of our "garden city" work.

The building of an entirely new city was a problem that to-day hardly ever presented itself we were chiefly concerned with city improvement, reconstruction, and development, and for the provision of districts for certain sections of the community, as in "garden cities" and "garden suburbs"; but, whatever our work, we should aim at creating a delightful environment for human habitation. This should be the recognised aim of the town planner. With this end in view, we should seek to provide for the proper distribution of a city with its different component parts, carefully studying each in its relation to the whole and making ample provision for proper connexions. We should have to provide residential districts, business districts, commercial zones, park systems, and pleasure places, for the grouping of buildings with reference to their relative use, and if we were to have satisfactory results there could be no question of an irregular or uncontrolled growth. To ensure success everything, down to the smallest detail, must be carefully studied and provided for, and this could only be done by adopting some formal system of town planning. He regretted that Mr. Unwin did not dwell at greater length on the relation of the architect to the town planner and to the architectural expression best suited to a formal town. He (the speaker) recently had the pleasure of reading Mr. Unwin's inaugural lecture on "Civic Design" at Birmingham University, and he was very much struck with what he stated should be the right attitude of the architect to the town:—"That he may in the design of his building consider the total effect of the town as more important than the individual prominence of his own building."

That seemed to go right to the root of the whole trouble; we lived in an age of extreme individualism, in which each asserted the glorious privilege of the Englishman "doing as he likes," with results the most anarchic and disastrous. Compare Regent-street as it was with Kingsway. In the one we have an example of refined uniformity, no monotonous repetition of uninteresting units, but a skilful combination of harmonious groups, which had a subtle relation to the whole design. In the case of Kingsway we have the record of a lost opportunity. What with a little forethought and consideration might have been one of the finest streets of the metropolis was a wilderness of architectural incongruities. Here, if anywhere, we could appreciate the necessity of some measure of control in the designs for the façades of our streets. Containing as it did several buildings of distinct individual merit, the general result was one of hopeless confusion. That exaggerated individualism and general lack of proper appreciation for all concerted effort which seemed to be a peculiar characteristic of our more important buildings of the last fifteen or twenty years had succeeded in making Kingsway the architectural laughing-stock of modern Europe. He thought we might assume as an axiom in all town planning schemes that the more important buildings alone should demand conscious attention, leaving the rest to be subconsciously felt. In conclusion, Mr. Ramsey referred to that part of Mr. Unwin's paper in which he spoke of the town planner as one who should settle the sites for the principal buildings, determine the lines of frontage, and to some extent control the character of the general design limiting the heights of buildings and the level of cornices. If he could do this he would achieve a splendid work, and would do more than anything else to bring about that unity of result which should characterise the architecture of a great and progressive nation.

Mr. Curtis Green

said he had before him an interesting paper on "The Comparative Desirability of the Formal or Irregular Treatment of Street Architecture in Large Cities," the subject being that set for the Institute of Architects' essay prize in 1901, and the essay which he had before him was by their old friend, the late Maryon Watson, who was Hon. Secretary of the Association at the time, and it was the essay which won the medal. That essay

ended to have a very great deal of wisdom and shrewdness in it, and was well worth study by all students of town planning. Mr. Watson in this essay had some very interesting remarks to make about formal and irregular architecture. There was the house inside the house to be thought about, and the man in the street. Though we wanted to work towards some definite scheme in the future, there were a great many difficulties to contend with in the formal movement. Like Regent-street, the finest piece of formal in what we had in London, that was being destroyed gradually. All city development was largely a matter of use, and it formerly was the custom to find a public house at every street corner, but that was no longer so, and was a question whether their architecture was to take on a permanent character or whether a building was to be pulled down and destroyed when its immediate use came to an end.

Mr. Gilbert H. Jenkins

and that one or two of the photographs shown by the lecturer appeared to contradict the statement that the garden around the house could be wholly formal in character and not gradually fade away into the landscape. The photographs showed a fading away into informality that was desirable. It seemed to me to be a fine thing if the centre of a town was planned on entirely formal lines, with fine vistas leading up to the public buildings, which would form a focus, and as the town extended into the country for it to get less and less regular and more informal. This would be in accordance with the kind of buildings which should be erected in the main streets of a city or town, and in the less main outskirts.

Mr. A. E. Richardson

and he thought a great deal of formal treatment and little of the informal. The informal, irregular treatment competed with Nature, and in doing so proclaimed its littleness. Mr. Unwin had shown some fine photographs of English and German architecture, but he noticed a regrettable absence of much of the architecture to be seen in London. London architecture was comparatively unknown to most of them, and in the study of small town planning, which he advocated, he commended everyone to go to the squares of Flanders and the streets and squares of Flanders, and so on, and study the buildings there, and to compare the designs of Somerset House and Waterloo Bridge with the Place de la Concorde. Most of the London squares were developed round fields, and the fields were not built on, but they were enclosed, and during the XVIIIth and early XIXth centuries the residents in the squares acquired their provisions from the neighbouring farms, and the streets and squares were supporting, forming residential centres of the town that was best in literature and culture. London offered some of the best examples of town planning in the world, and he should like to see students study these examples.

Mr. A. E. Bullock

and that we had not advanced much in dealing with the traffic problem. In relation to the Bank of England, for instance, Cheapside was a continued source of trouble to policemen. In all our town planning we failed to properly consider them from the traffic point of view, but too much from the artistic; and, bringing in mind the work of various Commissions, it was curious that no one had thought of a good way to deal with traffic difficulties. He thought that if we had round our circuses a subsidiary circular street of a radius of 300 yds. from the centre of the circle we should get a lot of the traffic away from the main crossings, and the congestion would be very much relieved. He thought it ought to study the West-end of London in considering the question, as the treatment of squares, etc., in many cases was very clever, and railway stations and municipal buildings much more space should be provided for traffic.

Mr. C. G. Boutcher

and he disagreed with Mr. Unwin that the principles applied to a small garden suburb as to a large city; they seemed to be in direct opposition. Though one would like

to be a formalist, it seemed to him that the opportunities for formal treatment were very small. A city grew, and one could not design a city, knowing what was going to happen. Town planning should be approached as house planning, for the problems were the same, and, if approached in the same way, we should get better results. A garden suburb should be planned as a small house is planned, merely taking into account its usefulness and the site. With a large city, where one had to treat the community as a whole, the formal treatment applied, and it should be limited to large cities, and should not enter into garden suburb work.

Mr. F. M. Elgood

said that there was little wonder if in that Association almost everyone was a formalist, chiefly because in formal planning one could see very definite results—some very fine and majestic results, and in informal planning one could hardly say that the results were entirely due to the planning; they were often merely accidental, and that was much in evidence in the views shown that evening. As a matter of fact, except on paper, he did not suppose it would be in the power of many of them ever to prepare plans for the formal layout of anything approaching a city; but, on the other hand, there were many practical pieces of work which were being done now and a great many more would have to be done in planning garden suburbs. Mr. Unwin spoke very strongly as to "completing the picture" by not letting a street go too far. That could be done in garden suburbs very satisfactorily by breaking the frontage line. Frontage lines, heights, and the character of buildings were three very important points to be remembered. As to height, he thought that the buildings being erected in Regent-street would destroy the proportions of the street, and as to the character of buildings, it was an interesting question for architects how far the design of buildings should be controlled. It was a perennial subject of discussion whether there should be any control of design, but he thought it was not at all improbable that soon some provision would be made as to this, and architects would wake up to find that their designs in certain town planning areas would have to be approved. He thought architects should keep their eyes open as to this, for the Local Government Board, he believed, considered that "character" in the Town Planning Act meant design as well as the kind of buildings, and if architects would take the initiative in this matter it would be very desirable. A Canadian visitor having asked for information as to the distribution areas of the commercial, residential, and the industrial—and having referred to the interest taken in Canada in the subject of town planning,

The Chairman,

in putting the vote of thanks to the meeting, said that the balance of opinion seemed to be more in favour of formalism than the irregular in town planning. He came across an interesting remark in the *Proceedings* of the Town Planning Conference held in London lately, which showed how far back the feeling for formalism had existed. Dr. Haverfield, in his paper, "Town Planning in the Roman World," says, "Ancient life, I think, differed from modern in nothing so much as in its preferences for set and almost crystallised forms within which to express itself. This is especially seen in the form given to the town. It was an old form—the familiar rectangular street plan. That, I think, is the town plan, which in all ages, till twenty or thirty years ago, men either invented or instinctively borrowed for their systematic town planning. We meet it in early China, in Greece, from the 17th century B.C., and in mediaeval England, and in many towns across the seas. The square and straight lines are indeed the simplest marks which divide man civilised from the barbarian. It has remained for the Teutonic spirit in these last days to connect civilisation with a curve." That was a very interesting statement from an able man, and one which explained a good deal of our preference, as a rule, for formalism in town planning. And they would remember what Mr. Unwin said about Ruskin's view in writing upon Liberty, how necessary it was to confine our actions within certain definite

lines—how impossible it was to go through life without some distinct principles.

The vote of thanks having been heartily agreed to,

Mr. Unwin,

in reply, said that perhaps he ought to have said a little more about the definite principles in favour of informal planning that were put forward by the present German school of town planners; because the discussion had rather assumed that informality was simply an accidental growth, haphazard, instead of resulting from a conscious attempt to reproduce irregular effects which arose in the past partly consciously, partly by accident, yet not so much by accident as we at first assumed. They arose very much from the fact that everybody at one time was working on one style, with one general appreciation and instinct for what was right in any particular case. That was not quite the same thing as accident; but it did approach nearer to the conditions which governed natural growth than any other conditions which were possible in the field of architecture. Whether we should ever get to a similar state, when we should all be so settled in our minds as to agree what are the right things and styles, when we should be able to work more freely, not because of greater liberty, but because of more obedience to a law which we all understood and appreciated, was a philosophical consideration which we might think of at leisure. It had hardly a practical side to it, however, while a town planner could not know what an architect would put up on any plot. He could not follow Mr. Boucher in thinking that there should be a definite distinction in principle between the planning of the centre of a town and planning of the outskirts. He entirely differed; the principles were the same, but the method of carrying them out might be different, because the conditions were different. He thought it was a dangerous thing to say that they were different principles. There was no sense in the mere statement that because you get away from the centre, or from the house, that you should become informal. But the circumstances leading to informality might have more relative weight in some cases on the outskirts. He agreed as to what had been said as to there being a great deal of useful planning in London, and in England, too, but except in a few instances he did not think we could find in England such useful examples of composition in town planning. If they wanted a distinct example of axial treatment they did not get such an effectual one as the Somerset House as in the Place de la Concorde. He could not deal that night with the questions of traffic or the interesting points raised by the Canadian gentleman. If a town plan was inconvenient for traffic it was a bad town plan; there might be many beautiful results, but as a town plan it was bad. These were essentials, and unless they were satisfied they failed on the essential lines.

The President announced that the next meeting would be held on October 30, when a paper by Mr. H. H. Hill, B.A., would be read, entitled "The A.A. Excursion to the Loire, 1911," illustrated by lantern slides. The meeting then terminated.

ARCHITECTURAL SOCIETIES.

Manchester Society of Architects: Presidential Address.

On the 11th inst. the first of the meetings of the Society's winter programme was held, when Mr. Edgar Wood, F.R.I.B.A., delivered the presidential address. In the room was exhibited a large collection of drawings and photographs of important architectural works of both past and present, which were obtained for the occasion by the President.

Mr. Wood said that he proposed to depart from the usual custom, which had been followed on many previous occasions, of reviewing the year's work and architectural achievement. He could foresee that a series of lamentations might be the result, and that was not the spirit in which a new session's work should be undertaken. A paragraph of James Russell Lowell suggested a subject for discussion and thought—"There is only one thing better than tradition, and that is the original and eternal life out of which all

tradition takes its rise." We all acknowledge, continued Mr. Wood, that tradition is the greatest factor and the greatest book that goes to our making. The difficulty is in its interpretation. The temperament of vigour will seek to express itself upon lines founded upon his own conception of the spirit of the work of his predecessors, strengthened by an intense craving to create for himself. How much originality and of reliance on the past is compatible with freedom of thought?

On tradition alone we cannot advance. If we make the past a crutch and ourselves a cripple we are exponents of intellectual stagnation. Do we show our appreciation of the Greeks more wisely in attempting the mechanical reproduction of their form, or by endeavouring to comprehend the spirit of full-grown manhood in which they wrought, to kindle ourselves by the emulation of it, and to bring it to bear with all its plastic force on our wholly new condition of life and thought. External imitation of a bygone excellence, or even by applying the rules which analytic criticism has formulated from the study of it, produces the artificial, not the artistic. That most subtle of all essences which eludes chemist, anatomist, and microscopist, the life, is, in aesthetics, not less shy of the critic. The Italian Renaissance fell short in its architecture, because to a living body of social and scientific new birth was bound the corpse of a past art. The great and magnificent development of plan was not accompanied by corresponding achievement in design. The architects were hard at work as students of antiquity, while the sculptors were yearning to create.

Yet the notion of absolute originality was an absurdity. A man cannot escape in thought any more than in language from the past. Not less preposterous than raising dead styles is the invention of new ones.

Art must be at once retrospective and progressive; its very progress a reflection returned from the mirror of the past. Its artists must be endowed with that energy of life which vitalises and becomes a channel of creative power. To the extent which they possess this force are they original, creative, fecund. Not in skill, device, artifice, or mechanism is originative impulse to be found, but in life. "They are torrents of will." They work in ways dissimilar, but the quality they possess is their measureless vitality, which the academic is unable to stifle or the archaeologist to smother.

From abstract thoughts and reasonings our minds can travel to the things of to-day and inquire how they influence our endeavours. In our planning we exercise every mental energy in satisfying practical requirements. We visit the most recent developments in every utilitarian direction, and this vitality has justly yielded its reward. Has there been equal success in the development of the architectural contribution, or has our energy exhausted itself before we are architects? Our clients, it may be said, do not encourage these things, but is that sufficient to stifle aspiration. Are not our convictions so true that we are ready to put them aside before the indifference of others?

We must, again, remember that the test of an artist will always be that he has some thing to say: that he is moved by some faith that he holds. He may be a scholar, or interesting, logical, industrious, but unless he is sincere he can only be a partial success.

Mr. Wood referred to the collections of works in the room. Reverence forbade any allusion to those whose works were of the long past, but of the others he could touch upon some as worthy of grateful tribute, and he concluded by an analysis of Westminster Cathedral, some works of Professor Pite, Mr. Henry Wilson, and others whose work was exhibited.

ENGINEERING SOCIETIES.

Institution of Municipal Engineers.

A joint meeting of the Yorkshire and Northern Districts of this Institution was held at Leeds on October 7, at the invitation of the former district. Some thirty members and others attended, assembling at the North-Eastern Railway-station, and driving to Harrogate-road, where a petrol roller was at work on a new tar-macadam road. Mr.

Prince, Surveyor of Highways to the Leeds City Council, met the party here. The next visit was to the works of Messrs. Thomas Green & Son, Ltd., Smithfield Iron Works, the members being shown round the works by Aldermen Penrose Green, ex-Lord Mayor of Leeds. After a passing call at St. James'-street, where a length of road laid with "Roomac" was inspected, the party proceeded to the fire-station, where they were treated to an exhibition turn-out of motor fire engine and horsed escape. Stables, men's quarters, and other buildings were inspected. The last visits on the list were to the water-pumping station and new filter-beds at Headingley, permission to inspect these having been given by Mr. G. Hensell, the Waterworks Engineer. A drive through Meanwood and Moortown to Roundhay Park, one of the largest public parks in the county, followed, and at 4.45 the party sat down to dinner at the Mansion Hotel in the park, Mr. John T. Pegge, City Engineer of Durham, presiding.

The day's programme was the work of Mr. H. G. Firth, the Hon. Secretary of the Yorkshire District. Mr. Pegge, in proposing a vote of thanks to Mr. Firth, laid stress upon the admirable way in which the programme had been drawn up and carried out.

GENERAL NEWS.

District Surveyors' Fees in London.

The first meeting after the summer recess of the Education Committee of the London County Council was held on Wednesday at the County Hall. The Committee agreed to a recommendation of the Buildings Sub-Committee to forward to the Finance Committee a special maintenance estimate of 500*l.* in respect of district surveyors' fees. Mr. Gautrey said this 500*l.* formed part of a payment of 2,000*l.* to the district surveyors for overlooking the construction of the Council's buildings, but, as a matter of fact, the overlooking of the erection of school buildings was done by the officers of the Council. The district surveyors would receive 2,000*l.*, and do nothing for it. They had an Act of Parliament behind them under which they could claim fees, and the Council could not stop it at present. The Council ought to take steps to get this thing remedied.—*Times*.

The Aldwych Site.

A contemporary, the organ of the South African Master Builders' Federation, is anxious that the example of Australia in proposing to erect in the Strand a palatial block of Commonwealth and State offices should be followed by the Union Government of South Africa, whose offices now consists of "two or three rooms in an obscure building in Victoria-street." If South Africa had its own building in a central position facilities would be afforded certainly for the supply of information in connexion with general trade, the building and mining industries, and agricultural matters, and good use would be found for land which has lain idle for so long.

Fritwell Manor.

The late Mr. Thomas Garner, who was in partnership with the late Mr. George Bodley, resided for many years at Fritwell Manor, Banbury, and devoted much time and money to its restoration. Fritwell, a Saxon manor, was granted to Bishop Odo at the Norman Conquest, and passed through many hands until, in 1570, it was sold to Edward Yorke, whose son is said to have built the present house. In 1730 Sir Baldwin Wake became owner. The manor was eventually purchased by the Rev. Samuel Yorke, a descendant of the original owners, in 1863. In 1892 Mr. Garner secured a lease of the house, which he described in his recently-published work.

"The Domestic Architecture of England during the Tudor Period." In restoring it every detail of the house has been carefully considered. The property, extending to 12 acres, will be offered at the Mart on November 8 by Messrs. Nicholas, together with the advowson to St. Olave's, Fritwell, where the first recorded plantation, in 1159, was confirmed by Pope Alexander III.

The Surveyors' Institution.

Mr. W. Edgar Horne, M.P., President of the Surveyors' Institution, will give his opening address in the enlarged lecture-hall

at the Institution, 12, Great George street, Westminster, S.W., at 8 p.m. on Monday, November 13. The portrait of Lord Alverstone, for twenty-five years Associate of the Council, will be unveiled on that occasion, and the Gold Medal for the best paper read during the previous session will be presented to Mr. E. H. Blake for his paper, entitled, "Some Notes on Highway Law as Affecting Property Owners." Other evenings during the early part of the session will be occupied by the resumed discussion upon Mr. Done's paper of last session on "The Development of Building Land" and a paper on "An Evening in the Institution Library," by Mr. Julian C. Rogers, etc.

The Royal Sanitary Institute: South African Branch.

The South African Branch of the Royal Sanitary Institute are arranging to hold a Congress in Cape Town on November 9, 10, and 11. This is the first Sanitary Congress to be held in British South Africa. Among the subjects set down for discussion are the disposal of sewage and school hygiene; papers will also be read dealing with other aspects of public health work. The South African branch has only recently been established by the Royal Sanitary Institute, and it seems to be energetically carrying on the traditions of the parent Institution. The Hon. Secretary to the branch is Dr. A. Jasper Anderson, the Medical Officer of Cape Town.

A Statue of the German Emperor.

A statue of the Kaiser will shortly be deposited in the session-room of the Berlin Academy of Arts. It has been sculptured by Professor Walter Schott, who has dressed the figure, in the XVIIth-century mode, in a perwig with the arms and armour of a Roman warrior, to accord with that of Frederick the Great, founder of the Academy, in another niche, and also with the decoration and style of the room. The cuirass is modelled after one of bronze in the Victoria and Albert Museum. The Emperor is shown holding a sceptre in his left hand resting upon his raised knee, with his right hand on the hip and his left foot resting on a ball.

Galton Laboratory of National Eugenics, University of London.

For the University of London, Professor F. M. Simpson, F.R.S.B.A., has made a set of sketch plans, which comprise a library, three laboratories, a lecture theatre, and a public museum, together with provision for the existing staff, research-rooms, etc., upon the Gower-street site, at an estimated cost of 15,000*l.* The authorities make an appeal for that sum to enable them to develop the study of the science of national eugenics in terms of the will of the late Sir Francis Galton and his bequest for the endowment of a professorship and laboratory. In pursuance of Sir Francis Galton's will the chair has been offered to, and accepted by, Professor Karl Pearson, F.R.S.

National Provincial Bank of England, New Premises.

The enlargement, in Dorset-street, of the Baker-street premises of the Bank is being carried out by Messrs. J. Simpson & Son, of Paddington-street, after Mr. Paul Waterhouse's plans and designs; the block No. 53, Baker-street, is by John Gibson (*obit* 1892), the architect of the Bank's premises at the junction of Threadneedle-street with what is now Bishopsgate, and in Piccadilly, and in several of our large provincial towns (see our issue of December 31, 1892). The Bank's new premises in Exeter, erected at a cost of some 11,000*l.*, are designed by Mr. J. H. Breverton, F.R.I.B.A., of Bournemouth.

Gas Fires.

With persistent rumours of coal strikes and coal famines, and rises in coal prices in actual being, it is not surprising to learn that the gas companies are finding a difficulty in coping with orders for gas fires. The growth in popularity of gas fires in recent years has, indeed, been extraordinarily rapid. This has been due, no doubt, to the improved design, accompanied by the increased efficiency of the fires brought out during the past two or three winters. Another cause has undoubtedly contributed to the growth of gas fires in public favour, and that is the fact

at this method of heating has been in recent years commended by the medical profession. We understand that all the principal gas companies have heavy stocks of coal on hand to meet the exceptional demands that is expected to fall upon them this winter, and that there will be no rise, possibly a fall, in the price charged by the largest company, i.e., the Gas Light and Coke Company.

Marble from Australia.

There are to be seen at the office of the Victorian Agent-General, Melbourne-place, a Strand, specimens of marble from Australia. These are specimens obtained from a quarry situated in Gippsland, Victoria. The deposits occupy a space of about 40 acres, showing, as they do, an endless variety of constitution, texture, colour, and marking. These specimens may be seen at any time. Mr. Gair, of Melbourne, who brought the specimens, will be in London for a few weeks, and will give any information to persons enquiring the same. Specimens of white marble will shortly arrive and be on exhibition the Agent-General's Office.

Housing and Town Planning Conference, West Bromwich.

The volume containing the papers read and the discussions at this Conference, held by the Institution of Municipal and County Engineers, illustrated by plates, will shortly be ready, and may be obtained of Messrs. E. F. N. Spon, Ltd., 57, Mark Lane, W., price 10s. 6d. The volume is edited by Mr. Thomas Cole, Secretary of the Institution.

MAGAZINES AND REVIEWS.

The *Art Journal* seems to be moving definitely in the direction of those other magazines that deal almost entirely with the work of the past, and to be devoting most of its pages to the connoisseur. An enthusiasm for the study of old furnishings seems to have taken possession of contributors rather to the exclusion of modern activities of art. As several other magazines already attempt to cover this ground, it seems a pity that the *Art Journal* should contract its range of interests to this type of subject. We welcome the illustrated article on Josef Israels (by Mr. Rudolf Dircks) as enabling those who have had little opportunity of seeing his works to form some idea of the character of his genius. Another article may be mentioned. It is by Mr. Darcy Braddell, who disputes the claim recently made in a book by Mr. Arthur Samuel (see review in our issue of June 2) that Piranesi, through his engravings, was the real inspiration of Robert Adam and other artists of the period. Mr. Braddell, however, cannot endorse this view, and is convinced that Adam was an independent genius who saw and acted for himself without "cribbing" from Piranesi. In his judgment we concur.

Professor W. R. Lethaby in the *Burlington Magazine* points out in a brief note the merit of some of the English medieval paintings to be found in our churches throughout the country. He refers to Mr. Tristram's series of copies of these works, and an excellent coloured illustration is reproduced from one of these of the Virgin and Child in the Choir Chapel at Chichester. The articles in this magazine—"Chinese Stone Sculpture," "Italian Medals in the Salting Collection," and "Old Chinese Porcelain from English Silver Models"—are all of interest to the decorative designer.

The most attractive subject dealt with in this month's *Connoisseur* is that of brass-harness ornaments, or amulets, as they are termed by the writer, Mr. E. V. Alison, who points out that the traditional designs for these are of extremely ancient origin. The variety in these designs might not be suspected by those who have not studied this form of art; the author of this article possesses about 200 different castings, and is acquainted with some 100 other designs. Many of these are based on symbolical figures, and others show a highly decorative treatment of subjects fairly obvious as to origin. The coloured plates in this magazine are not up to its

standard in other respects. We would rather have half the number if these were more artistically executed.

The *National Review* has a brief description of the recent activities of the German Government in converting the quiet and unprogressive Heligoland into a busy naval station.

In *Scribner* will be found an illustrated description of Hamburg, giving a good impression of the main features of this important city with its well-organised commercial activities.

Harper contains some remarks by Mildred Stapley on the American skyscraper, with illustrations of the effect in New York of these grouped masses of building. The impressive effect of these is well realised.

The *Pall Mall* has an article by Mr. W. Hyde on questions of St. Paul's Bridge, with sketches by the author of the possibilities offered for opening up St. Paul's on the lines that Wren would have adopted had he had his way in replanning the city. This instance of the present attitude towards our great monuments is handled as a text for the coming generation, who may be more enlightened. Another article on "The Building of a Jungle Railway" gives an interesting picture of pioneer work.

THE LONDON COUNTY COUNCIL.

THE first meeting of the London County Council after the summer recess was held on Tuesday in the County Hall, Spring-gardens, S.W., the Chairman, Mr. Edward White, presiding.

LOANS.—A loan is to be made to the Chelsea Borough Council to the amount of 3,700l. for the purpose of street improvements. The Islington Borough Council is to receive a loan of 2,600l. for the purpose of repaving works in Southgate-road (western side).

A loan of 1,194l. is also to be made to the Lewisham Borough Council in order for them to carry out the reconstruction of the Ravensbourne-street railway bridge.

The following loans were also agreed to:—St. Pancras Borough Council, 4,896l. for paving works; Shoreditch Borough Council, 6,000l. for contribution towards acquisition of a site for an open space; Woolwich Borough Council, 600l. for sewer works and 1,066l. for street improvements.

SCHOOL, SOUTHWARK.—The Education Committee reported that they had approved plans for the enlargement of the Pockock-street School at an estimated cost of 100l.

Vauxhall Sub-Station.—It was reported by the Highways Committee that it had become necessary to erect an additional substation at Vauxhall, owing to the increased service of cars in the district.

MEMORIAL TO KING EDWARD VII.—It was proposed by the Vice-Chairman of the Council, Mr. Cyril S. Jackson, that the formation of a park or open space at Shadwell would afford a fitting memorial in East London to the late King, and that it should be referred to the Memorial Committee for consideration and their report. This was seconded by Mr. J. Whitaker Thompson, and was agreed to by the whole Council. Another motion, however, was put forward by Mr. Frank Smith to the effect that it would be a more fitting memorial for a minimum wage of 30s. per week for a week of six days to be paid to the adult employees of the Council. The motion, however, met with no approval.

THEATRES, ETC.—The following drawings have been approved by the Theatres and Music Halls Committee:—

Britannia Theatre, Hoxton—provision of permanent cinematograph enclosure and re-winding-room.

Collins' Music Hall, Islington-green—alterations to balcony, alterations to electrical arrangements, provision of a permanent cinematograph enclosure.

Comedy Theatre—alterations to electrical installation, and alterations to sanitary arrangements.

Daly's Theatre—provision of two arc-light chambers at the sides of the gallery.

His Majesty's Theatre—provision of office for stage manager.

Holloway Empire—provision of a permanent cinematograph enclosure.

London Coliseum—adaptation of certain rooms for use as dressing-rooms, and of two lavatories for use as attendants' rooms.

London Hippodrome—alterations to lantern light over the stage.

Middlesex Music Hall—provision of electrical installation; provision of system of ventilation; provision of a tearoom at the balcony level; formation of openings between the stage, the emergency exit passage, and the dressing-room entrance.

New Theatre—provision of an arc lamp bracket in the passage at the rear of the gallery.

Palace Theatre of Varieties—provision of an oil engine and boilers in connexion with the lighting and heating of the premises.

Peckham Hippodrome—provision of a permanent cinematograph enclosure.

People's Palace, Mile End-road—alterations and additions to dressing-rooms and lavatories.

Playhouse, Northumberland-avenue—provision of electrically-driven fans.

Scala Theatre—provision of new generating chamber.

Shakespeare Theatre—provision of permanent cinematograph enclosure.

Terry's Theatre (Grand Casino)—provision of a new cinematograph enclosure.

Victoria Palace, Victoria-street—provision of electrical installation; arrangement of secondary escape staircase from the dressing-rooms; provision of a battery for the secondary lighting; provision of ventilating and heating appliances.

FULHAM EMPIRE.—It was reported by the same Committee and it was agreed that no objection should be offered to the erection of the Fulham Empire on a site at Nos. 444 and 446, Fulham-road, and that the drawings be approved.

CINEMATOGRAH THEATRE.—It was also reported that it was proposed to erect a new cinematograph theatre on a site at Nos. 538 and 540, Kingsland-road, and that drawings for the same were under consideration. A similar theatre is to be erected in the site of No. 140, Maida Vale.

BATTERSEA.—The Improvements Committee reported that various works were to be carried out in this borough, including the widening of Lavender-hill at the Battersea district post-office, at an estimated cost of 1,210l.

NEW BUILDINGS, WESTMINSTER.—The same Committee also reported that they had approved of the drawings of new buildings which are to be erected on a site at the junction of Smith-square, Westminster, with the proposed new street leading from the square to Tufon-street.

HANWELL ASYLUM.—In a report of the Asylums Committee it was stated that various alterations were to be carried out at this Asylum, including the removal of brickwork enclosure and flues and the provision of metal flues in their place. The estimated cost of this work is 190l.

FIFTY YEARS AGO.

From the *Builder* of October 19, 1861.

Increased Speed in Building Operations.

NOT many years ago, in provincial districts, which were even of importance then, the erection of houses or other buildings was a rare event and a work of time. In the northern counties of England, when the foundation of a building was commenced, there was a feast given to the workmen; and when the walls had been raised to the full height, and the first rafter of the roof laid, flags were hung out, and another feast was made, called the "raising supper." The time occupied in building a house or other structure was, in comparison with the present operations, extraordinary; but then the work was generally well and substantially done. Now the warfarer, particularly in the metropolis, may walk along a neighbourhood which is open and unbuild upon, and in less than two months after, passing the same way, will find it occupied by houses. The raising supper and other observances are not thought of.

EDITORIAL SUMMARY.

Our leading article, "French Neo-Classical Architecture," is a review of Professor Reginald Blomfield's book on "A History of French Architecture, 1494 to 1861," in two volumes. Some illustrations from the book accompany the article.

A second leader, "The Australian Capital Competition," deals with the constitution of the jury of assessors in the competition for the new Capital City of Australia (p. 438).

Under the heading "Notes" (p. 439) will be found comments on: "Painters and Lead Poisoning"; "The Duke of Rutland and our Ancient Monuments"; "Forestry in India"; "Portinscale Bridge"; "Canterbury Cathedral."

Some remarks on three picture exhibitions are given on p. 440.

A combined ordinary general and Camera, Sketch, and Debate Club meeting of the Architectural Association was held on the 16th inst., when Mr. Raymond Unwin read a paper on "Town Planning: Formal or Irregular?" and an interesting discussion followed (p. 440).

Some notes on the magazines of the month are given on p. 445 under the heading "Magazines and Reviews."

In Correspondence column (p. 446) will be found letters on: "Manchester Library Competition"; "The Coptic Monasteries of the Wady-el-Natroun, Lower Egypt"; "London Brick and Stone Work."

The illustrated Monthly Engineering Review (p. 449) contains articles on: "Messrs. Arding & Hobbs's New Premises, Clapham Junction"; "Foundation Loads"; and Notes.

The Building Trade Section (p. 455) includes: "The Industrial Council"; "Strikes and Lock-outs"; "The Employers' Parliamentary Council"; "Manchester Building Trade"; "Hull Master Builders"; "Applications under the London Building Acts"; "Projected New Buildings in the Provinces," etc.

A résumé of the twenty-seventh annual Report of the Council of the Society of Architects will be found on p. 459. The negotiations with the Royal Institute of British Architects in reference to registration are dealt with.

A report of a case under the Tribunal of Appeal under the London Building Act, i.e., "The London County and Westminster Bank v. the London County Council," is given on p. 459.

MEETINGS.

FRIDAY, OCTOBER 20.

The Royal Archaeological Institute.—Visit to Westminster Abbey. 10.30 a.m.

Institution of Mechanical Engineers.—Mr. E. M. Eden, of the Armstrong College, Newcastle-on-Tyne, Mr. W. N. Rose, and Mr. F. L. Cunningham (Graduate), of London, on "The Endurance of Metals: Experiments on Rotating Beams at University College, London." 8 p.m.

SATURDAY, OCTOBER 21.

The Institution of Municipal Engineers.—The third annual general meeting, to be held at Windsor.

The Institution of Municipal and County Engineers.—Metropolitan district meeting, to be held at Battersea. *Architectural Association*.—Mr. W. Kelly, A.R.S.A., on "Drum Castle." Illustrated. 7.30 p.m.

TUESDAY, OCTOBER 24.

Nathaniel's Architectural Society.—Opening and general meeting. (1) Announcements by the President; (2) short lantern lecture by Mr. H. Gill, entitled "Holiday Rambles in Norfolk." 8 p.m.

Battersea Polytechnic (Lectures on Illuminating Engineering).—Professor J. T. Morris, M.Inst.E.E., on "Electric Lighting." 7.15 p.m.

Architectural Association Athletic Club.—Annual general meeting. 6.30 p.m.

WEDNESDAY, OCTOBER 25.

Manchester Society of Architects.—Professor Beresford Pitt on "Esthetic Treatment of Ferro-Concrete." 6.30 p.m.

THURSDAY, OCTOBER 26.

London County Council School of Building, Farnborough, Brixton, S.W.—Second of a course of special Heating and Ventilating and Copper Pipe Work, by Mr. W. Fretwell, to members of the United Operative Plumbers' Association and other bona-fide plumbers. 8 p.m.

THE BUILDER.

[OCTOBER 20, 1911.]

London County Council School of Building, Farnborough, Brixton, S.W.—Special lecture on "Glass and Rome," by Professor Beresford Pitt. 7.30 p.m. The lecture will be illustrated by lantern slides.

FRIDAY, OCTOBER 27.

Glasgow Technical College Architectural Craftsmen's Society.—Professor Gourlay on "The College Diploma and Certificate Courses in Building." 7.45 p.m.

SATURDAY, OCTOBER 28.

Institution of Municipal Engineers. Visit to Brentwood Sewage Disposal Works.

COMPETITION NEWS.

Manchester Library and Art Gallery.

The Manchester City Council Royal Infirmary Old Site Special Committee met on Tuesday to consider the position as raised by the decision of the Council at the meeting held the previous Wednesday and the deposit with them of designs for a new Art Gallery and Free Library. They adopted the report of the assessor (Professor Reginald Blomfield, A.R.A.) on the two selected plans, out of which he chose one as the best. Of this plan Professor Blomfield reported that "the architectural character of the design generally is that of severe Classic, such as was practised in Manchester and Liverpool in the earlier part of the last century, and is, in my opinion, eminently suitable for the purpose. Its details have been well considered from a practical point of view, and the result is, in my opinion, a fine, straightforward architectural monument, well adapted to the site, and worthy of its position as a central feature of Manchester."

The Special Committee add that in consequence of the adoption by the Council of the resolution moved by Mr. Taylor they are unable to make a recommendation as regards the carrying out of the scheme. But inasmuch as such resolution excepts obligations which have been entered into, it is necessary to determine the successful architect in the competition which has taken place in order that his rights and the obligations of the Corporation may be determined. The Council are therefore invited for this purpose, and for no other, to approve the recommendation of the assessor and the Committee.—*Manchester Guardian*.

Australian Federal Capital.

Advices received by the last Australian mail are to the effect that the Minister for Home Affairs (Mr. O'Malley) has refused the suggestion, made by the Architects' Association of Great Britain and America, that they should have representatives on the Board to determine the competition for designs for the Federal Capital. The words of the Minister for Home Affairs were:—"The position taken up by the London Association shows a want of confidence in the honesty and impartiality of Australian professional men, and, although I regret the stand taken by so important an organisation, I cannot depart from the scheme laid down."

A.A. Silver Medal, 1912.

It is a sign of the times that the students of the Architectural Association have been set a re-planning scheme for next year's Silver Medal. The subject is "The Treatment of the Head of the Serpentine, Kensington-gardens End." The subject for the Travelling Studentship is a "Memorial Bridge to King Edward VII." No iron is to enter into the construction.

CORRESPONDENCE.

Manchester Library Competition.

SIR,—In publishing the statement that "Manchester architects are taking vigorous action" with the intention of upsetting an award which has not yet been made public in respect of designs which have not yet been seen, I feel that you are doing Manchester architects a grave injustice. I can claim to be in fairly close touch with a large number of Manchester architects, but Mr. Singleton's letter in your issue of the 13th inst. is the first intimation I have had of any such protest or intentions. EDGAR WOOD.

[** We may point out that, as stated last week, we are not responsible for correspondents' views.—Ed.]

The Coptic Monasteries of the Wady-el-Natroun, Lower Egypt.

SIR,—The writer of the interesting article published in your issue of October 13 has not explained at any length the plans of the various churches in the desert monasteries, but he has made one remark which calls for some comment. He states that the "churches follow no definite plan, but in common with all Coptic churches they have three eastern sanctuaries screened off from the main body of the church." It seems to have been generally accepted that three eastern "chapels" are essential to a Coptic church ever since Mr. A. J. Butler's assertion in his volumes on the Coptic Churches of Cairo and the Desert Monasteries in 1884; but surely it is unwise to accept a generality of this description on the evidence of the few examples which have at present been made public.

There are innumerable small churches throughout the Nile Valley, of which the desert sanctuary theory can only be made to apply by a great stretch of the imagination and the exclusion of the obvious evidence. The side aisles of these churches are often less than 2 metres wide, and the space between the screen and the end wall of the aisles in some cases is barely a metre, and could rarely have exceeded 1½ metres.

The churches seem to fall into four main groups, but no clear distinction is possible with the scanty information obtainable. These are the Cairene type, which consists of many chapels within one building; the larger monastic type, which is often similar to the first; the small monastic church; and the village church. Churches erected over the graves of saints seem to occur in some places, and it appears that the Nestorian cemeteries at the Oasis of El Khargeh are of the nature of groves of churches on a small scale.

Although it seems customary in Cairo and the Natroun Valley to incorporate several chapels in every church, it appears that in the restoration of the church dedicated to El Baramus, which was finished in 1884, no subsidiary sanctuaries were refurbished, at least on the main floor, even if they had formerly existed.

It must be obvious to any of your readers from the beautiful drawings and photographs published in your last issue that there is a great deal of interest and of value to be learnt from the Christian architecture in Egypt. It is time that some combined effort should be made for the systematic study of the various buildings before they are destroyed or restored. GEOFFREY S. MILLHAM.

London Brick and Stone Work.

SIR,—You noticed in your issue of October 6 the very pleasing result of bringing to light the old yellow brick facings above the shops in the Burlington Arcade, and a striking contrast to this piece of renovation that should not pass unnoticed is the painting, in common with the whole of the front, of the old Portland stone dressings to the premises in Piccadilly, at the corner of Bolton-street, recently taken by one of the London yacht clubs. The stone was bleached to a white that is not to be obtained by any applied decoration, and it is to be regretted that the characteristic note of a typical example of London architecture should have been sacrificed to the fresh garb of paint given to the whole building, matter for yearly consideration if this freshness is to be preserved, while the old stone and brick could only increase their harmony with age.

London brickwork might well receive a little more consideration, and one would not have thought it any longer necessary to enter a defence for the stone which, alone and in that happy harmony with brick, has produced those effects which have provided the Metropolitan with its architectural character, and will endure after the stucco fronts of Bayswater have exhausted even the virtue of the annual coat of paint to make them passable. MAX JUDGE.

AN OLD BUILDERS' MERCHANT'S BUSINESS.

With reference to the paragraph which appeared in our last issue under this heading, we are informed that the executors of the late Mr. Edward Penny Trepoard have induced the Manager, Mr. L. L. Stockwell, so long associated with the business, to say that he is prepared to transfer his services to the purchaser of the goodwill.

INTERCOMMUNICATION COLUMN.

Staining Stonework.

SIR.—Would any of your readers inform me the best method of treating new stonework to give it a permanent old appearance to make it match existing stonework in altering and restoring a house over 100 years old? The stone in question is a freestone of a yellowish-white appearance quarried near the house in the North of Scotland.

W. H. W.

Clay Foundations.

SIR.—The correspondence in your columns on underpinning is most interesting at the present time when one sees on every hand houses propped up "in splints" on account of settlements caused by the shrinkage of the clay subsoil following the very dry and hot summer we have had.

I have been wondering what amount of underpinning the Editorial note following Mr. Geo. Elms' letter in your issue of last week will produce in the minds of a great many—underpinning to a depth of 5 ft. or 6 ft.—and yet my experience of underpinning carried out in all parts of London under well-known architects is that 5 ft. or 6 ft. is the minimum in most cases, and I say deliberately and I have many instances which go to prove the statement that unless underpinning is tackled thoroughly and skilfully it is infinitely better left alone.

I have two jobs in hand now; in both cases the architects have much more difficult problems to deal with, and the work is

consequently more extensive, because previously an attempt had been made (in one case twice) to patch up the settlement by small pieces of underpinning under the fractures and pointing in the openings. Doubtless it cost less at the time, but the money might as well have been thrown away.

I should advise Mr. Elms, as I have many others, to put their difficulty into the hands of some competent architect, and give him a free hand to do what he considers necessary in their interest. To suggest, as is sometimes done, a reduction on what is advised on the ground of expense seems to me somewhat analogous to a patient asking a surgeon in the case of appendicitis if to remove half the appendix would not meet the case and reduce the cost.

CHARLES R. PRICE.

ILLUSTRATIONS.

Ashley Church, Staffordshire.

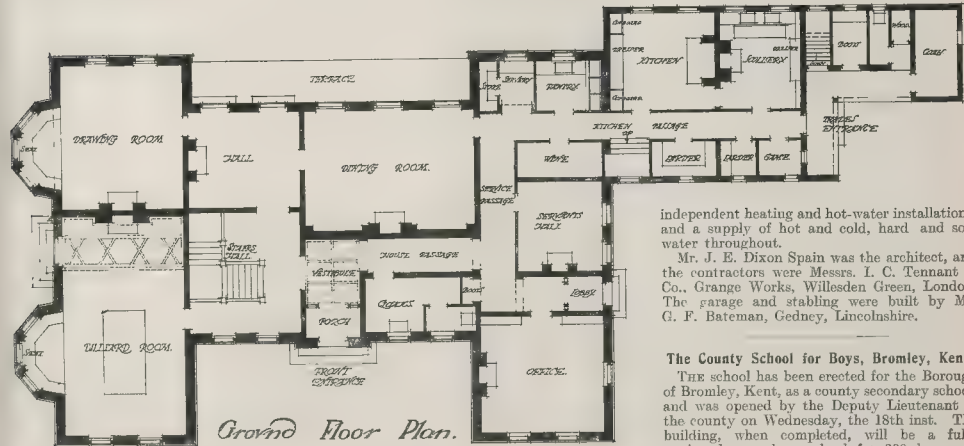

THIS church, recently restored by the late the Hon. F. Meynell, was built about eighty years ago, and is an example of the undignified type common to the period.

Although the fabric has not been disturbed to any great extent, the whole internal effect has been altered. The old and unsightly east window has been removed, and a tall, well-proportioned reredos now practically covers the east wall.

The old ugly deal pews have been replaced in the nave by chairs and by oak choir stalls in the chancel, which is now divided from the nave by a tall and elaborately traceried screen.

First Floor Plan.

Ground Floor Plan.

Hovenden House, Lincolnshire.

Mr. J. E. Dixon Spain, Architect.

A chapel has been formed in the north aisle by means of screens dividing it from the nave and chancel.

An organ gallery has been erected at the west end, and, externally, a new vestry has been built, the latter being entered under the gallery.

Other new features are a bishop's throne, sedilia, font, and black-and-white marble paving in the chancel.

The architect was Mr. Cecil G. Hare.

Workshop Priory Church.

The priory at Workshop was founded for Augustinian Canons about 1103 by William de Lovetot, to whom the manor belonged. The original church was transeptal, with aisles to the presbytery and nave, of which the western arch of the crossing and one bay of the nave remain. The rest of the nave was completed quite late in the XIIth century. The east end seems to have been transformed, like Southwell, in the thirteenth century, and of this work a still remains, but in ruin. The cloister was on the north side of the nave, and part of the western range remains.

The nave seems to have been always parochial, and to this fact its preservation is due; the whole of the rest of the building except the south chapel was destroyed at the suppression.

The parish has grown recently to such an extent that the nave does not hold anything like sufficient sittings in proportion to the population, and an enlargement of the church is absolutely necessary.

It is therefore proposed to build a new eastern arm with the transepts on the lines of the old work.

The east end, however, has to be restricted in length owing to the boundary of the churchyard. The south chapel is to be repaired in memory of the late vicar, and new vestries are to be on the north side of the presbytery. The style chosen for the new work is based upon the south chapel; but the south transept, having left a considerable piece of its XIIth century south end, will be repaired in character with that work.

It is proposed that the building be carried out in sections, as the necessary funds allow. The architect entrusted with the work is Mr. Harold Brakspear, F.S.A., A.R.I.B.A., of Corsham, Wiltshire.

Hovenden House, Lincolnshire.

THIS residence has recently been built at Fleet, Lincolnshire, for Mr. Arthur H. Worth. In general the design of the house follows on typically English traditional lines. The main staircase, chimney-pieces, hall-panelling, and joinery throughout have been designed and detailed in the same spirit. The external brickwork is purple and silver grey in colour, and the roof is covered with hand-made tiles. The house is lighted by electricity, has

independent heating and hot-water installations, and a supply of hot and cold, hard and soft water throughout.

Mr. J. E. Dixon Spain was the architect, and the contractors were Messrs. I. C. Tennant & Co., Grange Works, Willesden Green, London. The garage and stabling were built by Mr. G. F. Bateman, Gedney, Lincolnshire.

The County School for Boys, Bromley, Kent.

The school has been erected for the Borough of Bromley, Kent, as a county secondary school, and was opened by the Deputy Lieutenant of the county on Wednesday, the 18th inst. The building, when completed, will be a fully equipped secondary school for 300 boys; at present it provides for 200. The accommodation is best shown by the plans themselves;

but slight variations have been made in the execution of the work. The central block contains the assembly hall, class and lecture rooms, and the whole of the teaching portion of the school. The eastern and western wings contain the dining-hall, gymnasium, and ancillary accommodation. The caretaker's house and school kitchen adjoins the eastern wing.

The illustration of the building is from the drawing exhibited at the Royal Academy in 1903. The design is of XVIIIth century character, a fashion of building which adapts itself readily to modern requirements of light, ventilation, and arrangement, and, while of sufficient dignity, has a domestic feeling which makes it most suitable for school buildings. The elevations are of picked dark brown Crowborough bricks and Lawrence's hand-made red bricks, and the dressings throughout are of Portland stone. The roofs are covered with

dark red hand-made tiles. The floors are of steel and concrete, and care has been taken to ensure as far as possible sound-proofness by the provision of air spaces between the floors and ceilings. The assembly hall, headmaster's room, waiting-hall, etc., are wood panelled. The dados of antique glazed tiles in classrooms, corridors and staircases, and the tiling of the walls of changing rooms, lavatories, and cloakrooms make for both cleanliness and brightness.

The work has been thoroughly well carried out by the general contractors, Messrs. R. Cook & Sons, of Crawley. The stone carving and modelling has been executed by Mr. F. Brooke Hitch, and the wrought-iron entrance-gates are excellent specimens of the work of Mr. E. Norkett, of Maidenhead. Of other sub-contractors, Messrs. Shore & Co. are responsible for the heating and electric lighting; the Veronese Company for modelled plaster work;

the wall tiling is by Messrs. Martin van Straaten & Co.; sanitary fittings by Mr. T. Harris, of Blackfriars; the door furniture by Messrs. Humphries, Jackson, & Ambler; and the fire-places were supplied by Messrs. Bratt, Colbran, & Co.

The clerk of the works was Mr. W. Roberts. H. P. BURKE DOWNING.

MONTHLY REVIEW *of* ENGINEERING.

View at the Junction of Lavender-hill and St. John's-road.

Messrs. J. S. Gibson, Skipwith, & Gordon, Architects.

MESSRS. ARDING & HOBBS'S NEW PREMISES, CLAPHAM JUNCTION.

NCE the disastrous fire of Christmas, 1909, which swept away the ill-assorted collection of buildings then owned by Messrs. Arding & Hobbs at Clapham Junction, and caused the loss of many lives, a good deal has been written in technical journals and the daily Press regarding the risks in establishments devoted to the sale of textile fabrics and other inflammable materials.

We have already commented upon the Clapham Junction fire, and need not revert to the subject save to point out that the fire in drapery establishments can hardly be prevented by the adoption of fire-resisting construction and the provision of apparatus and appliances designed for the extinction of fire in its early stages. It is distinctly satisfactory to find that the new block erected for Messrs. Arding & Hobbs on the site of their former agglomeration embodies all reasonable precautions against another great fire—a fact which is all the more valuable to the firm and to Messrs. Gibson, Skipwith, & Gordon, the architects of the new building. The old premises originally consisted of a small building erected in 1885 on part of the present site, additional shops being added from time to time until the establishment employed for some 400 persons. Immediately after the fire steps were taken to clear the site, an operation

taking three months to complete and occupying 300 men, who worked day and night.

General Description.

Although a large amount of steelwork has been employed, the structure is not a steel-frame building, for brickwork has been relied upon as far as possible, and only in places where exceptionally heavy loads have to be carried, and where shop windows prohibited the construction of solid walls, have steel stanchions been introduced into the walls. The floors represent a combination of steelwork and reinforced concrete. The building is divided up into seven sections, isolated by fire walls and doors, and emergency stairs of fire-resisting construction provide ready means of escape from all the floors. An important feature of the general fire-fighting equipment is the sprinkler installation commanding every department of the establishment and supplied with water from a large tank in the upper part of the corner tower.

The view at the head of this article shows the general character of the architectural design, which, like that of many business premises, inevitably suffers from the demand for an almost unbroken line of windows for the display of goods, thereby compelling the architects to give an aspect of insecurity to the exterior and spoiling the effect of the

upper portion. It is sufficiently evident from our photograph that if the architects had been permitted to make the two lower stories accord with those above the building would have possessed considerable merit from the artistic standpoint.

The site covers an area of nearly 29,000 sq. ft., and the building has three street frontages, all faced with stone, on Lavender-hill, St. John's-road, and Ilminster-gardens respectively. The fourth façade between St. John's-road and Ilminster-gardens is isolated from the adjacent buildings. The lineal extent of shop windows is 650 ft., exclusive of "island" windows at pavement level.

Fig. 1 is a plan showing the general arrangement of the building at ground-floor level. Here the seven fire isolation sections are indicated, their outlines being formed by the thick interior walls. Section No. 1, occupied by offices, is 46 ft. 6 in. long by 32 ft. wide; Section No. 2, used for the restaurant, is 65 ft. long by 32 ft. wide; Sections Nos. 3 to 7, used as sale departments, measure 67 ft. 6 in. by 45 ft., 67 ft. by 61 ft., 96 ft. by 42 ft., 76 ft. by 42 ft., and 96 ft. by 42 ft. respectively, these dimensions only applying accurately to the sections of symmetrical form.

The fire walls separating the various sections of the building are pierced by inter-communication openings, all fitted with

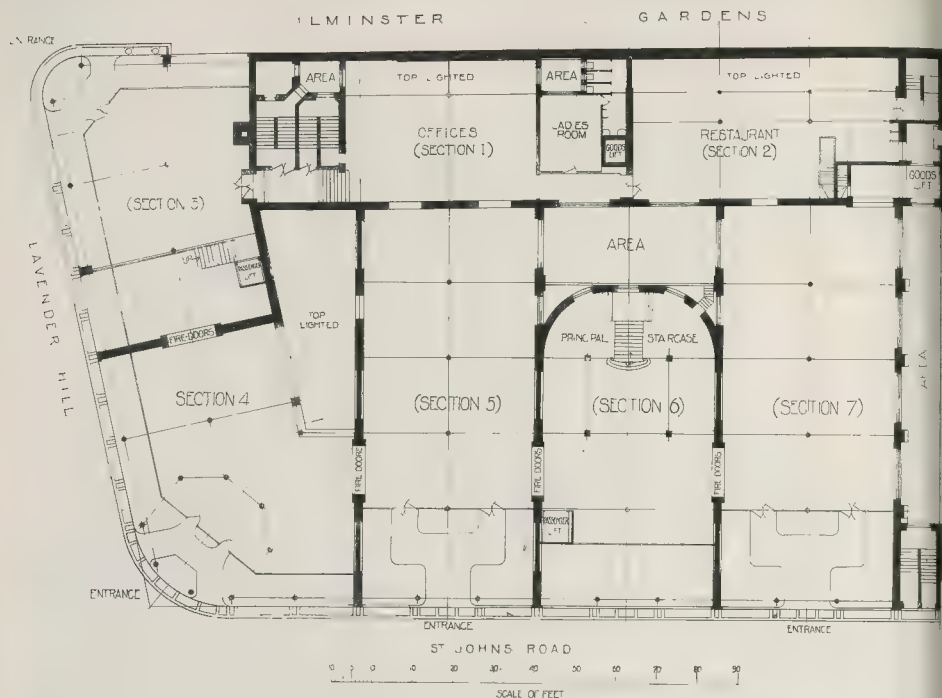

Fig. 1. New Premises for Messrs. Arding & Hobbs, Clapham Junction: Ground Floor Plan.

Messrs. J. S. Gibson, Skipwith, & Gordon, Architects.

double fire doors 3 ft. apart. These doors can be rapidly shut in case of fire, and are closed every day after business hours. As may be seen by reference to the plan, the openings are of different widths, those between the show-rooms being 12 ft. wide. The larger doors are of the sliding type and the smaller ones are hinged. In addition to

these fire doors, all doors used by the public are made of hard wood not readily attacked by flame. The plan also shows the ample provision made in the form of stairways for communication between the floors, the four staff and emergency stairs extending from bottom to top of the building. The principal stairs, a view of which is given

in Fig. 2, only continue to first-floor level, a secondary self-contained staircase being provided for connecting the first and second floors. For the convenience of customers and visitors, two passenger lifts connect the ground, first, and second floors, and two goods lifts have been installed for handling merchandise.

Section No. 4 includes the space under one of the interior light wells, the second light well being behind the principal staircase. A long area on the south side of the building also serves the purpose of a light well.

From the tower to the corner of Ilminster gardens Lavender-hill slopes upward to the extent of 16 ft., causing the ground floor along Ilminster-gardens to be quite below pavement level. Consequently the office and restaurant are top lighted, an arrangement rendered practicable by the fact that the building line is set back 10 ft. above ground level.

The four public entrances and "island" show windows in these are shown in the plan. The accommodation provided is as follows:—

Basement.—Receiving and packing rooms, stores, heating chamber, power and exchange rooms for fifty Lamson type vacuum system cash tubes, gentlemen's smoking-room.

Ground Floor.—Show-rooms, office, restaurant, ladies' room, and a post-office including telegraph, telephone, money order and savings bank departments.

First and Second Floors.—Show-rooms and counting-house.

Third Floor.—Work-rooms, staff dining and cloak rooms, kitchens, and service-rooms.

The roof is flat and covered with asphalt.

Steel Construction.

The main girders and beams throughout the building are of steel in spans averaging about 22 ft. and in no case more than 30 ft. between supports. These members are carried principally by built-up steel stanchions and solid steel columns of circular cross-section.

Fig. 2. Grand Staircase.

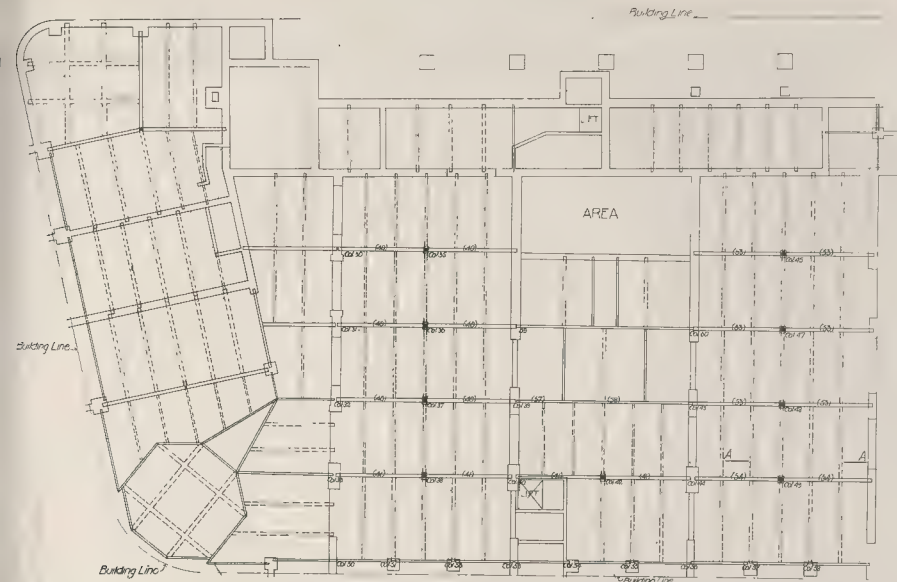

Fig. 3. Typical Plan showing Columns and Beams.

on. In some cases the girders and beams are carried at one end by brick walls.

The steelwork is cased in with concrete at least 2 in. thick, mixed in the proportions of 2:4 for protection against fire.

The tower at the junction of Lavender- and St. John's-road is an irregular polygon in plan. It is founded on a steel giraffe from which rise built-up steel stanchions receiving and transmitting all to the foundations.

The details of steel construction in the floors and flat roof do not differ materially, we may refer the reader to Fig. 3 for particulars of the girder and beam arrangement. This drawing represents the frame of the ground floor, including the steel stanchions, girders, and beams, and the concrete beams and slabs.

The foundations for the corner tower are supported by a steel giraffe embedded in

concrete, the arrangement being shown by the half plan in Fig. 4, where we also give a small diagrammatic key plan of the giraffe, which is 35 ft. square approximately, three of the sides being 7 ft. wide and one 9 ft. wide, the four sides forming a hollow square in plan with the corners removed.

The giraffe comprises two series of beams. The lower series consists of 9-in. by 4-in. I-bars spaced apart, from centre to centre, 1 ft. 2½ in. on Lavender-hill, 1 ft. 3 in. on St. John's-road and the opposite side, and 8½ in. on the fourth side of the foundation. The upper series consists of 18-in. by 7-in. I-bars arranged in parallel rows spaced 10½ in. apart, centre to centre. Stiffeners are riveted to the upper series of giraffe beams in the positions denoted by the letters SS on the half plan, details of the stiffeners being given in the drawing to larger scale in Fig. 4.

All three rows of the upper series are

securely connected by angle brackets at the corners, where also additional beams of the same dimensions as those in the lower series are placed diagonally.

The first drawing in Fig. 5 shows details of the eight built-up steel columns, Nos. 16 to 23, which extend to the height of 6 ft. 6 in. above basement-floor level, and are bolted at the bottom to the 18-in. by 7-in. beams of the giraffe. The stanchions are fitted with caps, a typical detail of the connexions being given above the elevations of the stanchion. It will be noticed that above the level mentioned the stanchions are continued in the form of cylindrical solid steel columns of 7 in. diameter.

The second drawing in Fig. 5 contains details of stanchion No. 50, which may be taken as being generally typical of stanchions built into brick walls for the support of heavy girders. It should be noted, however,

Fig. 4. Foundation Grillage of Tower.

Fig. 5. Details of Stanchions.

that some members of similar type are fitted with caps for the connexion of solid round columns continued above second-floor level.

The third drawing in Fig. 5 illustrates the construction of stanchions Nos. 46 to 49, which are typical of members employed as supports for beams intermediate between brick walls. These stanchions are continued up from the foundations to a short distance below second-floor level, and each is terminated by a cap for the connexion of a solid steel cylindrical column.

The fourth drawing in Fig. 5 represents the solid steel columns forming the continuation of stanchions Nos. 35 to 38, and being typical also of the cylindrical columns connected to stanchions Nos. 46 to 49.

The whole of the working details for the steel construction were prepared for the architects by Messrs. Drew-Bear, Perks, & Co., Ltd., of Battersea Steelworks, S.W., and bear evidence of sound and careful design throughout. As the architects have made a point of providing for an ample protection of concrete around all steel members, the metal introduced into the new premises is thoroughly safeguarded against the risk of the excessive heat which acted so disastrously upon the steel girders of the former building at Clapham Junction during the recent fire.

Reinforced Concrete Construction.

All suspended floors and the flat roof comprise secondary beams and slabs of reinforced concrete designed in accordance with the Kahn system by the Trussed Concrete Steel

Company, Ltd., of Caxton House, Westminster. The architectural treatment of the ceilings formed by the under-side of the floors is illustrated in Fig. 6.

Fig. 3 shows the steel girders and beams forming the main frame of a typical floor, and the secondary beams of reinforced concrete carried by the steelwork and monolithic with the concrete casing of the latter. As a general rule the reinforced concrete beams are constructed as continuous beams throughout each section of the building, and as they are designed as T-beams where the floor slab acts the part of a compression flange the dimensions of these members have been kept within comparatively small limits. The span of the floor beams ranges from about 15 ft. to 20 ft. and their cross-sectional dimensions from 6 in. wide by 11 in. deep to 12 in. wide by 20 in. deep. The roof beams vary from 16 ft. to 26 ft. long between supports, but, owing to the smaller load to be carried, the largest beams measure only 9 in. wide by 18 in. deep in cross-section. The floor slabs are generally 5 in. thick reinforced throughout by bars of slight sectional area.

In Fig. 7 we give sections of typical beams showing details of the reinforcement and the manner in which the steel girders are incorporated with the reinforced concrete work.

For the main reinforcement Kahn trussed bars and Kahn rib bars are employed, the bent up wings of the former providing web reinforcement. For the continuity reinforcement of beams and the reinforcement

of floor slabs rib bars are used exclusively. Trussed bars inverted are applied as anchors in non-continuous beams.

The general adoption of reinforced concrete for the floors and particulars for the roof obviously provides a most valuable safeguard against injury to the building by fire from within or without.

Sprinkler Installation.

In previous references to the Clapham Junction fire we pointed out the great desirability of adopting the automatic sprinkler system in all drapery establishments, and we are pleased to find that this invaluable safeguard against the spread of fire has been applied by the new architects.

The installation is served by the mains of the Metropolitan Water Board with additional emergency supply from a circular water tank, with the capacity of 8,000 gallons, placed on the upper floor of the tower at the height of 15 ft. above the high-sprinkler point, in compliance with requirements of the insurance company.

The sprinkler supply main enters the building at the north-east corner, the valve being situated at the foot of the staff stairs near the offices at ground-floor level. T. supply pipes are divided into two systems, each with main supply valve, and every floor of the building is provided with complete network of pipes with sprinkler points, commanding every square foot of floor surface. The installation, which includes 1,595 sprinklers in all, is provided with two alarm gongs in the interior light wells, and these would be sounded even if one sprinkler point were fused. The entire system was planned and installed by Messrs. Mather & Platt, Ltd., of Salford Ironworks, Manchester, and Queen Anne's-chamber, S.W., and is one of the best examples of sprinkler installation in the metropolis.

Conclusion.

Before concluding, mention should be made of other installations in the new premises.

The heating system, fitted by Messrs. Rosser & Russell, Ltd., of Charing Cross, S.W., is on the low-pressure hot-water forced circulation system, served by two large cast-iron sectional boilers fixed in the basement. The mains throughout are as far as possible concealed in chases or carried in places where they cause no disfigurement. Heat is distributed by circular radiators around the columns and placed against the walls.

Electric lighting has been adopted for every part of the premises, together with emergency gas services and fittings, but systems of lighting having been installed

Fig. 6. Costume Showrooms.

Fig. 7. Details of Reinforced Concrete Floors.

Messrs. Arding & Hobbs. The electric lighting scheme includes 110 arc lamps and metallic filament incandescent lamps thirty-two candle-power. The passenger goods lifts mentioned in the early part of article were provided and fitted by Mr. Smith, Major, & Stevens, Ltd., of London and Northampton, and the cooking stoves by Messrs. James Slater & Co., Wells street, W.C.

A striking feature of the interior is the careful design of the show-cases, counters, fixtures generally. This work was carried in solid carved mahogany, designed to harmonise with the decorative scheme, by Mr. E. Pollard & Co., of Clerkenwell. The general building contractor was Mr. James Carmichael, whose excellent business management was largely responsible for the successful execution of the works. After 9,500 cu. yds. of earth had been excavated for foundations, two large derrick towers were erected for handling the 5,500 tons of material used, in addition to 1½ millions of bricks. For facing the outer walls 15,000 cu. ft. of stone were required, the structural steel embodied in columns and beams amounts to 700 tons, and 1,300 tons of Portland cement have been used in fireproof construction. Figs. 8 and 9 show derrick towers and illustrate the rapidity with which the work was erected.

FOUNDATION LOADS. II.

TO ILLUSTRATE the great divergencies of opinion which may occur, even among civil engineers of wide experience, concerning the bearing power of soil, we will refer to a case of the Technical Board appointed by the Argentine Government in 1902 to

report upon the project for the construction of a port on the Parana River, one subject to which special attention was invited being the permissible pressure on the material to carry the foundations of the quay wall. The material in question consisted of Tertiary sand below the alluvial deposits in the bed of the river. It is stated by Dr. Corthell, M.Inst.C.E., who was Chairman of the Board, that professional opinions as to the pressure to be recommended ranged from 27 tons to 5 tons per square foot, while the contractor proposed the load of 7½ tons per square foot.

The Board finally decided upon the limit of 3½ tons per square foot, but Dr. Corthell was dissatisfied with this decision, and after individual communication with the members he found that the majority were of opinion that 5 tons per square foot would be safe. Consequently that was fixed as the maximum, and 3¼ tons per square foot as the mean pressure. The wide difference of opinion among experts thus disclosed caused Dr. Corthell to make further investigations, to which reference will be made later.

Clay is material formed by the decomposition and hydration of feldspathic rocks, particularly granite and gneiss, and of the crystalline rocks in general. It is almost invariably found with an admixture of sand and earthy salts with gravel in varying proportions. Apart from the differences of load-bearing power, which result from the presence of sand and gravel, other differences are due to the composition and consistency of the clay itself. Consequently, what are spoken of in general terms as clay soils exhibit great variations in respect of resistance to pressure.

Slate and shale stand at the top of the list, being capable of supporting any load that can be transmitted by masonry foundations, after them coming softer kinds of clay

merging by slow gradation down to the soft, moist and plastic material that squeezes out in every direction when under moderately heavy loads.

Another type of clay soil possessing great resistance is the firmly-compacted admixture of clay with gravel, and known technically as hard-pan. This is the most valuable of the beds which embody combinations of clay and sandy soils, occurring in mixtures of proportions which vary so greatly that it is frequently doubtful whether a given material should be described as "sandy clay" or "clayey-sand."

The treacherous nature of undrained clay, or clay to which water can gain access, is shown by many buildings and engineering structures.

In some cases subsidence occurs owing to the removal of water, or the lateral squeezing out of soft clay into neighbouring excavations; and in other cases lateral movement of the foundations takes place, a tendency which is common where the strata are not horizontal.

Engineers who have had experience with clay know that in London clay and almost every other variety there are greasy surfaces at various inclinations. If such a surface exists under the foundations of a heavy building there is every reason for anticipating unpleasant results due to slipping, however strongly the work may have been designed and executed.

Speaking on the subject a few years ago, Sir Douglas Fox expressed the opinion that "some portions, at any rate, of the London clay, and also of that in the neighbourhood of Rugby and elsewhere, would not carry more than 2 tons to the square foot." That, of course, is far below the average safe load for London clay, and probably below that for the most unfavourable examples. But the fact that the engineer mentioned has found it necessary in heavy works upon clay not to allow more than that small foundation load is significant of the careful discrimination necessary in selecting and applying data as to the bearing power of soils.

Sandy soils consist mainly of particles varying in size, coarse gravel being at one end of the list and fine sand at the other. No better support for foundations need be desired than a thick bed of gravel, while fine sand is almost equally desirable if the material is well compacted and protected from being washed away by the flow of underground water. But it must always be remembered that fine sand saturated with water behaves almost like a liquid, and that sandy soils of porous character are readily affected by running water.

In some places sand is so waterlogged as to bring it into the category of semi-liquid soils, which are never desirable, but must often be utilised for supporting foundations. Such soils, whether composed of sand, silt, or mud, require special treatment and the exercise of sound judgment. If the layer is too deep to justify removal, foundations can be carried through the semi-liquid material to a firm

Fig. 8. June 25, 1910.

Fig. 9. July 9, 1910.

stratum beneath, piles may be driven to consolidate the soil, or the pressure may be distributed over a large area by means of a raft foundation.

The safe bearing power of alluvial soils varies considerably with attendant circumstances and local conditions. Those who find it unavoidable to build upon material of the kind should always obtain exact data as to the strata beneath the site, and tests should also be made on selected areas of ample size in order to gain practical demonstration of the loads that may safely be imposed on the surface.

At the present time the most systematic tabulation of safe-bearing capacities for ordinary soils is that printed as an appendix to the paper by Dr. Cortrell, under the title of "Allowable Pressures on Deep Foundations."

Analysis of the data there presented shows that the pressure of stable structures upon various materials in which no settlement was observed ranges between the following limits:—

Fine sand.—2 tons to 518 tons per square foot, with the average of 402 tons per square foot in ten examples.

Coarse sand and gravel.—214 tons to 692 tons per square foot, with the average of 455 tons per square foot in thirty-three examples.

Sand and clay.—223 tons to 758 tons per square foot, with the average of 438 tons per square foot in ten examples.

Hard clay.—178 tons to 712 tons per square foot in sixteen examples.

Hard pan.—268 tons to 107 tons per square foot, with the average of 777 tons per square foot in five examples.

Alluvium and silt.—134 tons to 554 tons per square foot, with the average of 259 tons per square foot in seven examples.

In addition to the foregoing results, Dr. Cortrell found three instances where marked settlement occurred in fine sand, with the minimum load of 161 tons, the maximum load of 625 tons, and an average load of 465 tons per square foot.

For three cases of failure on a mixture of sand and clay the pressures ranged from 143 tons to 66 tons per square foot, with the average of 295 tons. This is very different for the average previously given for ten examples, and serves to emphasise the danger of relying upon general data in the computation of safe foundation loads. Five cases of settlement in London and other clay embody pressures from about 4 tons to 5 tons, with the average of 465 tons per square foot. In alluvial soils two examples of settlement are reported, the loads being 143 tons and 678 tons per square foot—a very marked difference.

The data here quoted are fairly in accordance with generally-accepted value, but, like similar statistics, they are only available for approximate computations. Precise information concerning the safe bearing power of any given site can only be obtained by tests and observations on the spot, and in the interpolation of results so obtained there is ample scope for the exercise of experience and discriminating judgment.

together with thirty miles of standard gauge and twelve miles of narrow gauge railway lines, and a railway terminus in the middle of the camp. The postal authorities are arranging for the equipment of thirty-one branch post-offices, ten telegraph offices, and telephones between all departments of the area. The temporary population will probably be not far short of 250,000 persons, and it is evident that the task of laying out and equipping the vast encampment necessary is one of unprecedented magnitude.

Austrian Ministerial Regulations for Plain and Reinforced Concrete Construction.

THE new regulations issued by the Austrian Ministry of Public Works relate to concrete structures, whether reinforced or not. They are divided into two parts; the first part applies to buildings generally and first defines the nature of the works coming within the scope of the regulations, as well as the conditions governing the design of such structures, the weight of various building materials, the live loads permissible, the weight of snow on roofs, the force of wind pressure, and stresses due to temperature variations. Then the regulations indicate the methods to be adopted in performing static calculations, and state the permissible working stresses for the materials employed. The succeeding chapter discusses the composition and testing of cements, sand, aggregate, iron, steel, and concrete, and lays down rules for the construction of concrete and reinforced concrete buildings and the tests to be applied after completion. The second part of the regulations contains similar information and instructions for the guidance of those designing and constructing highway and railway bridges. It will be seen that the regulations are far more complete than anything of the kind suggested in this country.

A New Torsion Testing Machine.

AS HITHERTO designed, testing machines only make provision of stress-strain diagrams being taken from the test specimens when tested under direct stress of a particular kind, while stress-strain diagrams under reversed or alternating stresses cannot be obtained from them. A new machine recently invented by Professor W. E. Lilley, D.Sc., makes provision for overcoming these defects, enables tests to be conducted under direct or alternating stresses, and differs essentially from existing torsional testing machines in the respect that stress-strain diagrams can be obtained from it. It is probably the first testing machine of its kind which enables this to be done.

As represented in the accompanying drawing, the machine consists of a circular plate A, fixed to a bench, and through which is fixed a hollow steel cylinder B for holding the test specimen C, one end secured by the key D, the other end passing through a ball bearing E, and secured by the key F to the lever G H I. Attached to I by J is a light arm K carrying the recording pencil L, which moves on the circular table M, capable of being rotated on the plate A. On H is a recording pointer O for measuring small torsional

strains when determining the modulus of rigidity or shear.

At present the machine is more or less in its initial stage, and may be capable of improvement in points of detail. We understand, however, that it has been used for practical purposes by Professor Lilley, who finds that the results obtained differ very little from those given by the specially-built type of torsion testing machine, while for determination of the modulus of rigidity his machine gives more consistent results than the large appliance, and is far simpler to use.

Waterloo Station.

FOR more than seven years the work of extending and remodelling the Waterloo terminus of the London and South-Western Railway has been in progress, and it is probable that operations will continue for two or three years more. The new station has been in use for a considerable period and now that the company have obtained Parliamentary sanction for removal of the obsolete single line connecting with the South-Eastern Railway Station of Waterloo Junction the roof of the centre station is being continued in compliance with the arrangement adopted for the south station. This work has involved the temporary closing of two main line platforms and the modification of running arrangements. Every effort is being made to push forward the work as rapidly as possible, and after its completion the north station will be taken in hand. An interesting announcement has recently been made to the effect that a new road which has been under construction for several years will shortly be opened to the public. Commencing near the railway bridge over the Westminster Bridge-road, the thoroughfare in question passes under the railway lines and encircles the entire area of Waterloo Station and is connected to branch roads with Lower Marsh and the south-east side.

New Water Supply Works.

A SCHEME inaugurated a few days ago for increasing the water supply of Birkenhead includes two masonry dams to be built at Pont-y-Alwen, in Denbighshire, at a cost of about 1,250,000. Only one dam has been commenced, the reservoir formed having sufficient capacity to increase the supply by some 11,000,000 gallons daily.

The last portion of the new works for improving the water supply of Devonport was completed this month by the opening of a new storage reservoir at Crownhill, with the capacity of 21,300,000 gallons. The complete scheme included a storage reservoir at Douland, a 5½ pipe line thence to Roborough, in addition to the new reservoir mentioned, which has been three years in construction.

At Shanklin an auxiliary water supply has recently been put into service. The source is well 45 ft. deep with two horizontal adits, one 45 ft. and the other 90 ft. long. Water is pumped to a reservoir of 150,000 gallon capacity by machinery in a new pumping station, the whole of the mechanical plant being in duplicate to avoid the risk of interrupted services.

ENGINEERING NOTES.

The Delhi Durbar Camp.

THE temporary extension of the Delhi Durbar Camp, for the forthcoming Coronation Durbar will provide for a population considerably greater than the capacity of the city, as well as for spectators of the Durbar and various tournaments to be held. Accommodation will be established for guests of the Indian Government, for native potentates, and for other visitors. Some of the camps are to be equipped with buildings and others with tents. Camp hospitals and dispensaries will be included, and also a dairy under the control of the Director of Military Farms. The water supply installation will comprise two services, one of filtered water for drinking purposes, and the other of water from the canal system. Electric light is to be installed throughout the temporary city, current being supplied from a central generating station to be established on the site. Many miles of new roads are to be constructed,

New Torsion Testing Machine.

THE BUILDING TRADE.

THE INDUSTRIAL COUNCIL.

THE Government scheme "for settling and for shortening industrial disputes," as set forth in the text, printed in our last issue, of the official document issued from the Board of Trade is likely to be welcomed as a recognition of the national need of some happier method of dealing with industrial disputes than at the present time, and whatever may be the chances of success of the new bill the scheme may be regarded as an attempt to deal with a difficult and important question. It must be inferred, from statements issued, that the Board of Trade is fully aware of the difficult nature of the problem, and that they do not cherish the hope that the scheme will result in the absence of strikes and lock-outs altogether, but a successful scheme for strengthening and improving the existing official machinery for settling disputes will certainly be a great gain to the general public who are "adversely affected," but to the industries directly concerned. But while we are prepared to welcome the Council, composed of employers' and workmen's representatives, meeting to consider the purpose of considering, and settling into matters referred to them in trade disputes, they are likely to arrive at a speedy and peaceful solution of a dispute, it is not to be inferred that they possess larger powers than those of any conciliation board, for it is expressly stated that the Council will have no compulsory powers. The difficulty foreshadowed by the scheme is not that the employers' and workmen's representatives will fail to agree, but that they will fail to agree to themselves the right to regulate the industry. As we understand the situation, there is a growing dislike by the wage-earners to the existing methods of settling disputes, and it is this dislike and the tendency to go over the heads of the leaders that has given some of the disputes their alarming and dangerous character. It seems to be supposed that labour has more to lose than gain from arbitration, and that the machinery of arbitration is set up for the purpose of stemming the increasing power of the wage-earners. If this belief is at all general, the Industrial Council, however representative it may be, will stand in much the same position as conciliation boards which have no compulsory power. Any attempt to invest the Council with such power would be doomed to failure, for we doubt if the trade unions have anything to do with any compulsory powers.

Any body possessing compulsory powers being the question, it does not follow that the Council will be unable to do much valuable work, but we must wait for fuller particulars of the working of the scheme, of the "situation" that is to be taken, and of any advantages which will make the Council an improvement on existing machinery. One of the advantages of the scheme as it strikes us is that all disputes affecting one trade will not be considered by those interested in that trade, but by the representatives of all the trades—some of them directly affected, it may be, and all indirectly; and it may well be that the united decision of a body of able men representing the principal industries of the country, invested with a sort of public authority, will have a powerful influence upon the trades generally; a sort of moral force will work which cannot fail to be for good. However, if the Council act with promptitude, a dispute is considered without delay, may be done to narrow the dimensions of a strike or prevent it taking place at all. The experiment, which will be watched with considerable interest by the building and allied trades—in fact, by the whole community—will be of great assistance to Sir George Thompson, K.C.B., the Comptroller-General of the Board of Trade, who has worked with such conspicuous success as an arbitrator and intermediary in industrial disputes, in giving him the immediate advantage of the advice and opinions of representative masters and men who have

the respect and confidence of those they represent, and whose opinions, for that reason, should greatly assist in the settlement of disputes. Moreover, the meeting of these selected men on both sides should result in a better understanding, not only on any particular issue, but on points of view generally—an outcome which would be of great value in the adjustment of the relations of capital and labour. Anything that can be done to remove the causes of industrial disputes and do away with strikes altogether will be of the greatest public advantage, and, believing in the value of conference and conciliation in the removal of industrial misunderstanding and the adjustment of differences, we heartily welcome the new Council and wish it every success.

THE EMPLOYERS' PARLIAMENTARY COUNCIL: THE TRADE DISPUTES ACT, 1906.

THE Employers' Parliamentary Council is calling for such an amendment of the law relating to picketing and labour combination "as will bring it into conformity with the wishes of the whole body of employers and traders, and with the opinion of the great majority of the working classes and the general public of the United Kingdom." The Council state that "When the Trade Disputes Bill was before Parliament five years ago, the Employers' Parliamentary Council protested that the measure was one to legalise intimidation, since it permitted persons on strike or persons acting on their behalf to terrorise workmen who were willing to work, and who would not obey the dictates of the labour unions. 'Peaceful persuasion,' it was urged, was a misnomer, the real object and the real act of the 'persuader' being intimidation pure and simple. Deputations representing the Employers' Associations throughout the country waited upon the Minister in charge of the Bill and sought to influence the Government in the direction of modifying the proposed legislation in such a way as would conserve the elementary rights of employers and willing workmen, and amendments with this object in view were moved. The Government, however, ignored all protests and arguments; the clamorous demands of the labour party were acceded to, and the Bill became law. . . . The objects of the Trade Disputes Act, 1906, were (1) to nullify the decision in the case of *Lyons v. Wilkins*; (2) to make a privileged class of labour unions by making them immune as regards responsibility for their actions in trade disputes. . . . Prior to the action of *Lyons v. Wilkins* it was generally assumed that, although violence and intimidation were illegal, the statute allowed workmen who had a difference with their employers to attend at or near the employer's premises with the object of inducing other men, by argument and persuasion, either to leave or to refuse to accept employment with the master whose premises were picketed. The case decided that the words of the Act, 'to obtain or communicate information,' were to be understood literally, and did not cover the totally different procedure of argument and persuasion. . . . The labour unions, forced to the conclusion that there were no means whereby the law relating to picketing and conspiracy could be evaded, resolved, in the words of the President of the Labour Union Congress, 1902, to 'face the facts in a bold and honest manner, and go right out for an alteration of the law.' The agitation culminated in the passing of the Trade Disputes Act, 1906."

The Employers' Parliamentary Council urge that, in the interest of private liberty and public order, picketing should either be rigorously suppressed or the number of pickets should be limited to two; and pickets should be required to carry on their argument in such a place and in such a way as not to be a nuisance to a former employer or his workmen, or the public. As the law stands, they contend, a mob of unlimited numbers may "attend at or near a house or place where a

person resides or works or carries on business or happens to be," and indulge in "peaceful persuasion" until the person is reduced by fear or by violence to subjection. At present the person picketed has practically no remedy whatsoever.

STRIKES AND LOCK-OUTS.

THE twenty-third annual report on strikes and lock-outs has recently been issued, covering the year 1910. The number of workpeople involved in disputes (515,165) was the highest since 1893, whilst the aggregate duration in working days of all the disputes in progress during the year (9,894,331 working days) has only been exceeded on four occasions in the previous eighteen years. The current year seems, however, likely to exceed its predecessor in this respect, for, as we recently pointed out, the loss of working days in the eight months already totals 7,821,800. In his Preface to the Report Sir G. Askwith refers with satisfaction to the increased resort to methods of conciliation and arbitration, the number of workpeople involved in disputes settled by these methods being the highest recorded in the decennial period for which statistics have been prepared, but we fear that the spread of these rational methods of settling disputes will be found to have sustained a severe check when the history of 1911 comes to be written.

In the Report it is stated "The building trades, which for the four previous years had been remarkably free from disputes causing a stoppage of work, experienced even less trouble in 1910, and the number of workpeople involved in such disputes was the lowest on record"—an observation abundantly justified by the figures given in the Report, as but 628 workpeople in this trade were directly involved in disputes.

The building trade, despite its depressed condition, continues to show a good example to other trades, both in the avoidance of disputes and in the adoption of rational means in settling them when they arise.

In this Report it is noticed in connexion with trades generally that the question of wages, the most usual cause of dispute, only accounted for 20 per cent. of the workpeople involved in disputes, whilst 50 per cent. were involved in disputes as to the employment of particular classes of persons. This appears to us a peculiarly unsatisfactory cause of dispute, especially in a time when trade is increasing, and we note with some satisfaction that in the building trade only forty-three persons were involved in disputes arising from this cause.

MANCHESTER BUILDING TRADE.

THE firms and men interested in the building trade of Manchester and Salford are, says the *Manchester Guardian*, still in doubt about the immediate future of the industry. Four weeks ago the builders' labourers in the district asked that the minimum wage should be raised to sixpence an hour, and that several alterations, one of them the inclusion of the time spent in walking from the employers' shop to the job on hand in the day's working hours, should be made in the conditions of their labour. A definite reply to the demand was not given by October 2, the date fixed, but so far the men have not carried out their threat to declare a general strike of all engaged in the building trade in Manchester and Salford.

A new issue is introduced into the dispute by the decision of the members of the Building Trades Federation to take steps to abolish non-union labour, and it now remains to be seen how the committee of the Federation will attempt to give effect to that resolution. It is recognised that the present is not a good time for a general strike, as, in addition to the slackness which generally prevails in the building trade in the winter months, the industry has not recovered from the depression which has afflicted it for several years. Small disputes have occurred from time to time in various parts of the city, and trouble has arisen through painters working in Manchester Corporation libraries refusing to continue at

work while non-union men are also employed, but these disturbances have been regarded as of the first importance. A general strike would be difficult to organise and maintain, for there are many men still outside the different trade unions, and the complaint that a minimum rate of sixpence an hour is not paid is almost entirely directed against a few firms not allied to the Employers' Association. The plasterers, who are as well organised as any section of the workmen, are, as a whole, satisfied with concessions recently obtained, and a strike on their part would break an agreement which provides for the giving of a six months' notice of a demand for a further advance.

The builders allied to the Employers' Association are willing, they say, to meet reasonable demands, but they have no influence over outside firms, so that if a big strike occurs it will lead to numerous negotiations with individual firms and will upset the good relations most of the large firms have established with their employees. It remains to be seen what developments will follow the refusal of painters engaged in the redecoration of three Manchester branch public libraries. Some of the trade union officials believe this strike is the beginning of an extensive movement which will involve carpenters, joiners, painters, bricklayers, and their labourers, plumbers, plasterers, and French polishers.

HULL MASTER BUILDERS' ASSOCIATION.

The monthly general meeting of the Hull Master Builders' Association was held at the Builders' Exchange, Posterngate, recently, the President, Mr. R. Finch, in the chair.

Amongst the trade matters discussed was the increase in the employment of out of town contractors and labour by Hull firms who are known to have an extensive business connexion in the city and district. It is a well-known fact that during the past two years there has been a depression in the building trade, which has been keenly felt by both employers and workmen, yet outside contractors (usually from underpaid districts) are allowed to come in with their own workmen and at the lowest estimate take away 75 per cent. of the payment, while local employers are at a standstill and their workmen out of employment. This deplorable state of affairs is by no means due to the lack of facilities afforded by local trades men, as the building trade of Hull possesses some of the most skilful of workmen and old-established firms of contractors who are thoroughly capable of entering into competition with outside firms with regard to price, design, and workmanship.

Mr. E. Quibell gave a report of the meeting of the Yorkshire Federation of Building Trade Employers, held at Bridlington on September 15, when the National Insurance Bill, Trade Disputes Bill, and the Trade Unions Bill were discussed.

The objections and suggested amendments to the Insurance Bill received from the various branches of the Federation have been forwarded to the Chancellor of the Exchequer and the President of the Board of Trade, together with an emphatic protest against the further heavy burden proposed to be placed upon the building industry, which is already seriously affected by other legislation during a period of abnormal depression.

With regard to the Trade Disputes Bill, the Federation carefully considered the ignoring of directly appointed trade officials during the recent trade disputes, also the ignoring of conciliation arrangements. Resolutions were passed on the and the Trade Unions Bill.—*Eastern Morning News.*

GENERAL BUILDING NEWS.

ABINGTON-AVENUE CONGREGATIONAL CHURCH, NORTHAMPTON.

This church has a frontage to Abington-avenue and Purser-road. The style adopted is decorated Gothic. The church comprises nave with one centre and two side aisles, choir, organ chamber, ministers' vestry, choir vestry, and gallery at the Purser-road end. The total accommodation, 550, is provided as follows, viz.:—Nave, 440; gallery, 72; choir, 38. The nave arcade has five moulded arches on either side, supported on octagonal piers, and the whole is executed in rubbed Bath stone. At the junction of Abington-avenue and Purser-road is a tower, having eight recessed belfry windows with oak louvres: the tower is further utilised for the stairs to the gallery. On both sides of the clearstory are five three-light tracery windows. In the end wall of the choir is a four-light tracery window, and a five-light window faces Purser-road. The walls externally are faced

with local Duston stone, the windows, mouldings, plinths, coping, etc., are of Bath stone. The roofs are covered with red sand-faced tiles. The total cost of the building, boundary walls, paths, etc., will be about 4,500. The contractors are Messrs. E. D. Sharman & Son, Northampton. The architects, Messrs. Ernest R. Sutton, F.R.I.B.A., and F. W. C. Gregory, of Nottingham.

NEW SCHOOLS, ROMFORD AND WALTHAMSTOW.

The Essex Education Committee have just reported that they had considered the report of a local committee in favour of making provision for a boys' secondary school at Romford, and have resolved that the matter be referred to a special committee to confer and report. The Committee also reported that the plan, prepared by Mr. C. J. Dawson, of Ilford, for a new County High School for Girls at Walthamstow for 300 girls, including a caretaker's house, had now been approved by the Board of Education, and tenders will be invited. The estimated cost of carrying out these plans, including latrines, drainage, furniture, fencing, architect's and quantity surveyor's charges, and all other expenses, is 15,195.

UNIVERSITY COLLEGE, EXETER.

Additional buildings of the Royal Albert Memorial University College will be opened by the Lord Lieutenant of Devon, Lord Fortescue, on October 20. The first building, the result of an enlargement scheme which was approved by the Governors in 1904. The present addition has been erected on a site purchased at the rear of the main building of the Royal Albert Memorial at a cost of 8,675, for land and about 16,400, for the building. This occupies only about half of the site acquired. It is intended, when the funds of the College permit, to use the remainder of the land for the erection of a College Hall and a building for the Technical Department. The new buildings are built of brick and Portland stone, and the designs of Messrs. Tait & Harvey. They consist of two blocks—one for the University College and the other for the Day Training College—and they provide the following accommodation:—University College.—Ground floor—General and advanced laboratories, etc.; lecture and staff rooms for the Department of Chemistry, Principal's room, women students' common-room. First floor—Lecture and staff rooms. Second floor—Biological laboratory, lecture and staff rooms. Day Training College.—Ground floor—College library, rooms of Professor and Mistress of Education, common-rooms for men and women students. First and second floors—Lecture and staff rooms.

NEW HOME FOR NURSES, DEARNLEY.

This new home at the Workhouse Infirmary is being erected from the designs of Mr. Herbert Clough, architect, of Rochdale, at a cost of about 5,500. The contract is being carried out by Mr. Robert Kay, builder, of Rochdale, and the building, when finished, will provide accommodation for forty-one persons.

NEW PICTURE PALACE, DOVER.

This building, which is to be known as the "Boyle" has been erected at a cost of 7,500, from the designs of Mr. A. H. Steele, architect, and has accommodation for about 900 people.

NEW DRILL HALL, LOWESTOFT.

The designs for this hall were prepared by Mr. F. W. Richards, architect, of Lowestoft, and the total cost of the building was about 5,000. The contract was carried out by Messrs. Hawes & Sons, of Norwich.

NEW COUNTY BUILDINGS FOR DUMFRIES.

At a meeting of the Dumfriesshire County Council, plans by Mr. J. M. Dick-Feddie, Edinburgh, were submitted of the proposed new County Buildings to be erected in English street, Dumfries, on the site of the present militia barracks, at a cost of 21,000. The plans were approved of.

TRADE NEWS.

Under the direction of Mr. W. H. Bell, architect and surveyor, Newbury, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air mules, has been applied to St. Bartholomew's Grammar School, Newbury. The Bluntisham Church of England School, Hants, has recently been fitted with one of grates, supplied by Messrs. O'Brien, Thomas & Co., Upper Thames-street, London, and Excelsior Works, South Bermondsey.

The Royal Berks Hospital, Reading, is being supplied with Shorland's double-fronted chester grates by Messrs. E. H. Shorland & Brother, Ltd., of Farnworth, Manchester. Messrs. G. A. Williams & Son, blind specialists, have removed from 21, Queen's-road, Baywater, to their more spacious freehold premises, No. 42, nearly opposite.

Balfour Paul, architect, 16, Rutland-square, Edinburgh.

Fence Houses.—Extensions to premises for the Chester-le-Street Co-operative Society.

Fermoy.—Four houses (765l.); Mr. D. Creedon, builder, Rathely-road, Fermoy.

Folkstone.—The following plans have been passed:—Eight houses, Shorncliffe Station-road, for Mr. W. Davis; four houses, St. George's-road, for Mr. C. Rootes; three cottages, Peter-street, for Mr. G. Mortlock; Mr. H. Videan, architect.

Forfar.—Headquarters, etc., for Territorials, Brechin-road, Messrs. Gavin & Soutar, architects, 42, East High-street, Forfar.

Harwich.—Headmaster's house at County High School (1,010l.); Mr. J. H. Nicholson, Secretary, Education Committee, Essex County Council, Chelmsford.

Hayward's Heath.—King Edward Memorial

cottage hospital; Messrs. Wheeler & Godman, architects, Bank-chambers, Horsham.

Howden-le-Wear.—Improvements to parish church (450l.); the Vicar.

Hull.—Fishermen's school (10,000l.); Mr. J. H. Hirst, City Architect, Hull Town Council.

Hulme.—Cottages, Barrack-street site (7,615l.); Mr. Henry Price, architect, Manchester City Council.

Hyde.—Police offices and court rooms (4,500l.); also public hall (8,500l.); Mr. J. Dingle, Surveyor, Hyde Town Council.

Ilkeston.—School, Bennerley-street (3,650l.); Mr. A. Earnshaw, builder, Burr-lane, Ilkeston.

Keighley.—Oil engine works (2,500l.); Messrs. Moore & Crabtree, architects, Cavendish-street, Keighley.

Kingswear.—Railway station; Mr. Harold Smith, Great Western Railway Office, North-road, Plymouth.

Kingswood (Bristol).—Science school; Mr. R. S. Phillips, architect, The Cross, Gloucester.

Kirkby Lonsdale.—Hospital (1,000l.); Mr. J. Russell, Surveyor, Kirkby Lonsdale Urban District Council.

Lamberhead Green.—School, Woodford-street (200 places); Mr. J. W. Horne, Secretary, Education Committee, Wigton Town Council.

Lancaster.—Isolation hospital; Mr. W. D. Ball, Clerk, Board of Guardians, Lancaster.

Leith.—Additions to works for Messrs. Bertram & Sons, engineers, Leith Walk, Leith.

Manchester.—Proposed extensions to Royal Exchange, Bank-street (500,000l.), for the Royal Exchange, Ltd.

Marple.—Picture palace, Union-road, for the Palatine Theatre Company.

Muthill.—Extensions to public baths (2,000l.); Mr. Charles Ewing, Crief.

Nelson.—Weaving shed off Brunswick-street for the Marsden Mill Company, Ltd.

Newcastle (Ireland).—Seven houses (990l.); Messrs. W. J. Campbell & Sons, builders, Carlton House, Carolan-road, Belfast.

Newcastle-on-Tyne.—Proposed baths; Mr. W. J. Steele, Engineer, Newcastle Town Council.

Newport (Mon.).—Remodelling, etc., front portion of baths: Architect, Newport Town Council, House, near Newport (2,500l.); Mr. A. G. Babbage, Clarence-chambers, Pontypool.

Newquay (Cornwall).—Pavilion (750 places); Mr. John Ennor, jun., Surveyor, Newquay Urban District Council.

Newry (Co. Down).—Seven houses, Church-street (990l.); Messrs. W. J. Campbell & Sons, builders, Carlton House, Carolan-road, Belfast.

Patrick (Glasgow).—Alterations to tramway depot, Hayburn-street; City Architect, Glasgow City Council.

Plymtree.—Rectory (2,000l.); Mr. Harbottle Rees, architect, 12, Castle-street, Exeter.

Pontymoile.—School (2,275l.); Messrs. Turford & Southward, builders, Ludlow.

Radcliffe.—Additions to infirmary (21,000l.); Mr. E. Warrin, architect, 20, Bedford-square, W.C.; Messrs. Woodbridge & Simpson, builders, Oxford.

Rhos Brithdir.—School (3,600l.); Mr. G. Hitchens, architect, Welshpool.

Rochford.—Infants' home; Mr. W. J. Wood, architect, 26, Alexandra-street, Southend-on-Sea.

Romford.—Cottages on sewage farm (1,000l.); Architect, care of Mr. J. Turvey, Surveyor, Romford Urban District Council.

Rufford (Manchester).—School (600 places); Mr. C. J. Bristowe, Secretary, Education Committee, Notts County Council, Nottingham.

Rugby.—Children's home (740l.); Mr. Perkins, builder, care of Mr. J. W. Pendred, Clerk, Board of Guardians, Rugby.

Shawclough (Rochdale).—Offices, etc., for the Rochdale Asbestos Company, Ltd.

Smethwick.—Extensions to works, Bridge-street, for the Smethwick Steel Company.

Southampton.—Shelter, convenience, store, and mess-room (520l.); Mr. W. Buck, jun., builder, care of Mr. J. A. Crowther, Engineer, Southampton Town Council. The following plans have been passed:—Alterations and additions, No. 102, St. Duns-road, and two houses, Ampthill-road, for Messrs. Weston & Burnett; school, Oak Mount, Brookvale-road, and two houses, Newlands-avenue, for Messrs. Jurd & Sanders; motor garage, Brookvale-road, also thirty-three houses, Bond and Dimond roads, for Mr. J. Smith.

Stoke-on-Trent.—School of science and technology; Architect, care of Mr. W. L. Copeland, Secretary, Education Committee, Stoke-on-Trent Town Council.

Sunderland.—Extensions to foundry for Messrs. John Lynn & Co.

Swansea.—The following plans have been passed:—Four houses, Cecil-street, Manselton, for Mr. Henry Rogers; two houses and shops, Penvelion-road, for Mr. D. Thomas; fifteen houses, Maesteg-street, St. Thomas, also extensions of premises, Maesteg-street, for Mr.

D. W. A. Saunders; additions to Build Arms, Oxford-street, for the Swansea Unit Breweries; eighteen houses, Ysgol-street, for Mr. E. Murphy; four houses, Ysgol-street, for Mr. S. Govier; eight houses, Prince of Wales-road, for Mr. C. Gustavus.

Tibshelf.—School (5,000l.); Mr. G. Widdowson, architect, St. Mary's-gate, Derby.

Twickenham.—A plan has been passed, additions to No. 12, Walpole-gardens, Messrs. Collinson & Co. A plan has been lodged for rebuilding a shop and house, Heath-road, for Mr. G. Stark, ironmonger.

Wallsend.—Club, Coronation-street; Architect, care of the Secretary, Wallsend S.C. Club.

Warrington.—School (13,000l.); Mr. T. Buttery, architect, Queen-street, Marle.

Messrs. J. Dolan & Son, builders, Warrington.—Wattsville (Mon.).—School (7,500l.); Messrs. Bailey Bros., builders, Pontypool.

Wimborne.—Territorial headquarters; Mr. F. T. Maltby, architect, South-street, Dorchester.

Woodside.—School (2,750l.); Mr. W. Cowdell, architect, Alloway-chambers, Ayr.

Yarmouth.—School of art, Trafalgar-road, also school for boys at Cobholm; Mr. Cockrill, Borough Surveyor, Town Hall, Great Yarmouth.

York.—Houses, Alma-terrace; Mr. F. Spurr, Surveyor, York Town Council.

THE LONDON BUILDING TRADE.

It is stated that a movement is on foot among the members of the London Building Trades Association to endeavour to secure a revision of the hours and wages which are in force at present. There are eighteen sectional unions concerned with the trade in the metropolis, and these are federated together with the London Building Industries Federation, the total membership being upwards of 20,000. No definite decision has yet been arrived at, but the members are being balloted with a view to ascertaining the general opinion of the members in regard to the proposed alteration. The general rules in force, agreed upon between the men's union and the Master Builders' Association, provide that the hours of work are fifty in the summer and forty-four in the winter, and the wages ranged from 7d. an hour for a labourer to 11d. in the case of skilled mechanic. The complaint of the men is that wages have not risen in proportion to the increased cost of living.

PATENT SPRINGLESS LOCK.

Messrs. Chubb & Co. have recently introduced a lock design on a new principle. It is only in its without springs, but without substitutes for springs, such as weights. The object of the design is to press the tumblers or their equivalents in one direction, so that they may be in contact with the key as it is being used, and return to rest when the key is removed. Without a spring, a tumbler or another lock might get into what is called an open position, and remain there, which would be enough to prevent the proper locking from opening the lock. In this new Chubb lock the detainers are not tumblers, level pins, or discs, as in other locks, but are shaped something like the letter U, with the ends of the U pieces at right angles to the sides of the U. The U pieces slide laterally in a channel fixed to the bolt, and when locked one arm of each pin is in front of the end of the rim to prevent inward movement of the bolt. The key, made of flat metal, is stepped on both edges, and distance across any pair of opposite steps equal to the distance between the parallel sides of the U. The key enters between the sides of the U, and as it is turned the longer step moves the U pieces their required distance one way or the other, from the centre of the key, so that the step opposite to each of the U pieces is in contact with the side of the U, causing the movement checks overmovable from momentum or gravity. When the key is at right angles to the sides of the U, the pieces all the steps on both sides of the U are in contact with the sides of the U, and the ends of the U pieces are just clear of the ends of the rim, so that they now form an obstacle to the movement of the bolt. At the moment, if the key be further turned, the bolt begins to move by the action of the revolving carrier, which is taken round by the key. Just before the movement of the key and U is completed, and the key steps are leaving the U pieces, the scatterer begins to act. The scatterer is a part of the carrier, and is shaped as to move the U pieces in both directions into positions very different from those at which the lock will open. The important factors of security are present. Undoubtedly lifting and overlifting are possible, as in good locks, and take place, when an attempt is made to pick the lock of a wrong key used. If undetected, a U piece catches at the end on the rim, and if overlifted on the other

Mr. Munroe, in opening the case, explained that the appeals related to the erection of bank premises in the Wimbledon Park-road, at the corner of Augustus-road. The bank purchased land in 1907, and it consisted of 236 square yards. It was simply an open space, and the bank had not yet erected any partially erected bank premises. The new building between Southfields Station and the county boundary. The appellants had no intention of building until the place was ripe for a bank; but they were informed that it was the intention to build a row of small houses in Augustus-road, and that in order to fix this might fix the building line in Augustus-road, the bank buildings were commenced on March 27. The building had proceeded very slowly, and had reached the first floor. Dealing first with the position in Wimbledon Park-road, the appellants had gone a considerable distance of over a mile in order to find the building line; but he had not been content with that, because instead of going straight on when he got to the bank premises, he "slewed" the line round, and cut off the bank's land. He submitted that, firstly, the appellants had taken the line, and secondly, that he had then skewed the line round and destroyed the whole value of the bank's frontage. The reason for this was obvious. At some time the County Council would wish to bring tramways to Wimbledon Park-road, and the appellants would then be in a position to say whether they should buy the land at its market value or sterilise the land.

and buy it at its sterilised price. As the matter stood, the bank would only be able to build on two-and-a-half square yards out of 236 square yards of land. He might say that the bank did not want to make anything out of it, and would hand the whole thing over to the County Council at cost price. With regard to the Augustus-road, the Superintending Architect had gone across the Wimbledon Park-road and had taken the buildings in Ripplingham-road as fixing the building line for Augustus-road. He contended that the County Council had, in taking such an extraordinary long length in Wimbledon Park-road, done the very thing which was denounced by Mr. Justice Wills in cases which came before him in 1894.

Mr. Horace Cheston, architect, of Union-court, Old Broad-street, said he was called in on April 7 with regard to the erection of the bank. He visited the site on April 9 and found that certain work had been executed on the site by Messrs. Turtle & Appleton, builders, under the direction of Mr. Lee, the superintendent of works for the appellants. He prepared plans, and a contract was signed by Messrs. Johnson & Co. for the erection on May 7, and they commenced work on May 12. With the exception of the work done by Messrs. Turtle & Appleton the site was an open field, and there were no signs of building in Augustus-road.

Mr. Macmorran said he was going to contend that the question of Augustus-road was one for the magistrate. The Superintending Architect was called in by the Wandsworth Borough Council to fix the building line, and he went down and fixed the line from the buildings then standing.

Mr. Munroe said the point was whether the appellants were to be permitted to go on with their building?

Mr. A. A. Hudson (the Chairman): We are not going to fix the building line. We are only going to fix so far as we can see the general line of buildings.

Witness proceeded to give evidence as to the progress of the building and of the cottages erected in the Augustus-road, and was cross-examined as to whether the cottages were not started before the bank buildings.

Mr. Lee, superintendent of buildings for the appellants, gave evidence as to instructing Messrs. Turtle & Appleton to erect part of the brickwork boundary walls on the site in question, and Mr. H. Smith, representing this firm of builders, stated that he commenced the work on March 27 and that it was finished on April 5.

Cross-examined by Mr. Young, witness said he did not give notice of the work. That was not that he did not consider it a building, but because he thought the architect had given notice.

Mr. F. Boxall, a foreman of Messrs. Johnson & Co., the builders who contracted to do the work under Mr. Cheston, stated that he set out the site on May 12, and gave the District Surveyor notice on May 13. He used part of the brickwork which had been put in by Messrs. Turtle & Appleton. When he started the work, he was sitting on the adjoining land in Augustus-road; but there were no bricks on the site. On May 15 the men began to excavate for the cottages, and they got up to the first floor in about a week.

In cross-examination, witness denied having ever stated that he did not use any of the brickwork put in by Messrs. Turtle & Appleton.

The hearing was adjourned till Tuesday, when Mr. Dady addressed the Tribunal. He said that with regard to the suggestion that the Superintending Architect had gone too far from the general line of buildings, he would point out that had someone built a row of houses in the Wimbledon Park-road, on the part now unbuilt upon, the bank would have been in a very different position. It was quite clear that the bank could have come in 1907 and got the building line determined.

Mr. Slater (a member of the Tribunal) pointed out that the Superintending Architect could not define the building frontage where there were no houses.

Mr. Dady said the appellants bought with the chance that houses would come in one part of the road or another, and it was their own fault if they built without getting a decision. There were two suggestions before the Tribunal with regard to Wimbledon Park-road. The Superintending Architect said it was a homogeneous road of much the same nature all along its length, and that *prima facie* the general line of buildings should be governed from the whole of its length by some houses which are already put up in the southern part of it. The contention of the appellants was that the building they proposed to put up could not be described as being in the road—meaning the whole length of the road—and, therefore, discrimination must be

used, and in some way or another the road should be divided up; and it should be said that the bank building was in a different part of the road from the part in which there were existing houses. The appellants said there were no houses in the southern part of the road; but they would never have erected the building if they thought that other houses would not be built. Then it was said that a perfectly straight line had not been taken, but that the Superintending Architect had allowed for the gradual curve in the road.

Mr. Hudson said their difficulty was that they were not dealing with the building line, but with the general line of buildings. It had no relation to the width of the street or other things, but must be the general line of buildings. He could see cases where they might prolong the line of buildings, but he doubted if they could follow it into a curve. There could be no dispute that on June 12 there was a building 5 ft. above the ground on the bank site, and therefore when the Superintending Architect fixed the line he must obviously take into account the bank building, which was the only building.

Mr. Dady said Augustus-road was the meaning of "taking into account." He admitted that it was within the power of the Tribunal to stop the general line of buildings at Augustus-road; but the Superintending Architect said the whole road should be taken into account. If it was said that they were not to carry on the line of buildings from an existing set of houses in nothing but a perfectly straight line, then, of course, the objection of his friend was fatal.

Mr. Hudson said they could not lay out the general line of buildings simply to improve an estate, but they had to make the general line deduced from the buildings already there, and it might be that the buildings as existing were in a curve. Hence it all depended on the particular case.

Mr. Dady said the Tribunal had to find in what road the bank really was. The Superintending Architect had found that the building was in Wimbledon Park-road, meaning the whole length of the road. With regard to Augustus-road, he thought it would be agreed that the work done by Messrs. Turtle & Appleton was in the nature of staking out a claim. His submission was that the Superintending Architect in fixing the general line of buildings must take into account the buildings there when he fixed the line.

Mr. Hudson said they had to ascertain if there was any general line of buildings in the street at the time the appellants put up their building. If there was a general line, and the bank came in front of it, then that building would be unlawfully there. He admitted that his view used to be that they had only to take into account the buildings which were there; but the decision in regard to Euston-road has shaken his views, because it was held that they must take into consideration only buildings which were lawfully present, and this might mean going back to 1700.

Mr. R. E. Smith, District Surveyor for Wandsworth, stated that on April 1 the builders called on him and stated that they were putting in a boundary wall on the site. He saw the work being done, and reported to the Superintending Architect on April 5 that work of a more substantial kind than a boundary wall was being done. He received a notice from Messrs. Johnson & Sons, the builders, of their intention to build on May 9, and their foreman brought the plans round to him on May 15. He viewed the building operations, and came to the conclusion that the building line was being infringed, and on May 15 he wrote to the builders stating that they would be carrying on the work at their own risk. To the best of his belief the whole of the work done by Messrs. Turtle & Appleton was taken out. The work of setting out the adjoining villas was done on May 16, and concreting went on on May 22.

In cross-examination, witness said that, rightly or wrongly, since April 5 all parties knew that the work done by Messrs. Turtle & Appleton was intended for the external walls of the bank.

Mr. W. Lane, builder, of East Sheen, stated that he and his partner owned seven plots of land in Augustus-road, and had built six pairs of villas. The first pair were 20 ft. 6 in. from the street to the bay windows. Each pair of villas dropped back a foot. They commenced clearing the site for the first two houses on May 9. They started pegging out on May 15, and on the 16th they started digging, and went on continuously. They commenced the brickwork on May 22 or 23, and this was above the ground level of concrete. He believed he commenced building his houses before the bank had a brick on the site.

Mr. Wright Miller, Sanitary Inspector, gave

evidence of the progress of the works on bank site, and said that Boxall told him the whole of the brickwork put in by Messrs. Turtle & Appleton was taken out.

Mr. A. Milford, assistant, of the Superintending Architect's Department, expressed the view that the general line of buildings should be fixed by the existing buildings.

Mr. Peter Dodd, Engineer and Surveyor of the Wandsworth Borough Council, was called by Mr. Young, and put in a notice received from Messrs. James & Lano of their intention to build seven houses on May 9, and that were disapproved. They sent in amended plans on May 22, and these were approved by the Highways Committee on July 1. Messrs. Johnson & Sons gave notice of their intention to build on May 13, and these were also disapproved on account of the drains. Amended plans were submitted on June 7 and approved on July 4.

Mr. Courdope Munro addressed the Tribunal. He reiterated his contention that the appellants, in starting on the bare fact established a building line. If it was to be held that the houses erected in Augustus-road were to govern the building line, it would be agreed to any owner who wished to proceed in a proper way with his building, by consulting an architect and so on, would be caught in a trap if someone came along and rushed up a row of houses in a few weeks.

The Tribunal reserved their decision.

WESTMINSTER CITY COUNCIL.

At the sitting of this Council on Thursday, October 12, the following, amongst other matters, were dealt with:—

Piccadilly Circus Rebuilding.—It was reported that the London County Council had agreed to the application of Mr. John Munro for the re-erection of buildings in Regent-street, Piccadilly, and Glasshouse-street, certain lines, and subject to certain conditions. This building line agrees with that approved by the City Council on July 6 last.

Hotel de France Site.—The Highways Committee reported having received a notification from the London County Council, dated September 13, of a resolution allowing a modification of the provisions of sect. 41 of the London Building Act, 1894, with regard to open space about buildings, so far as relates to the proposed erection of an hotel building on the site abutting upon Glasshouse-street, Aldersgate, Brewer-street, and Sherwood-street, shown on the plans submitted with the application of Messrs. W. J. Ansell and H. Tamm, jun., subject among other conditions to the following:—That before the commencement of the erection of the building the whole of the land cross hatched red on the block plan left open for the use of the public for the term of the lease from the Crown. Within the boundaries of the proposed site is King's Arms Yard, in regard to which serious and vexatious ownership have been performed by the Highway authority, including the paving of the yard in 1896. It was agreed to inform the architects that the yard will be claimed as a public highway vested in the Council.

LAW REPORTS.

Minter v. Waldstein.

MR. MUIR MACKENZIE, the Official Referee, has fixed: Friday (to-day) for delivering judgment in this case.

It will be remembered that the action was brought by Mr. F. G. Minter, a builder and contractor, against Dr. Charles Waldstein, Professor of Art at Cambridge, from whom he claimed 2,750l., the amount payable in respect of a certificate of Mr. Frederick Wm. Foster, an architect, and in respect of a contract made between the plaintiff and the defendant for the carrying out of alterations and additions at Newton Hall, Hartson, near Cambridge.

Defendant alleged that the work was defective, and counterclaimed against the plaintiff for 10,000l. damages.

The case was reported in the issues of *The Builder* of July 14, 21, 23, August 4, 11, 18, and 25.

HIGH COURT OF JUSTICE, CHANCERY DIVISION. (Mr. Justice Eve).

Schworer v. Bethnal Green Borough Council. Infringement of Ancient Lights.

In this case the plaintiff, Joseph Schworer, claimed damages from the Bethnal Green Borough Council for damages for infringement of the ancient lights in his premises situate at 20, Patriot-square, Bethnal Green.

defendants denied that their building had any loss of light which would amount to nuisance, and pleaded that there was a plentiful light in the room for all reasonable requirements. They also alleged that a room belonging to Messrs. Colmans, & Co., to the south and south-west of the plaintiff's premises, interrupted to a considerable extent the access of light.

Mr. Jessel, K.C., and Mr. St. John Clarke, for the plaintiff, and the defendant were represented by Mr. P. Ogden, for the defendant, and Mr. J. T. Prior, for the plaintiff.

Mr. Jessel, K.C., in opening, said that the plaintiff was the owner of the premises, 20, Finsbury-square, and was in receipt of the rents and profits. In 1909 the Council took over and erected on the site, and on adjoining land, a Town Hall, at a lateral distance of 16 ft. 6 in. therefrom. The plaintiff's house consisted of a basement and three floors, and rooms at the back (south) were lighted by windows, one in each of the sloping sides of a bay. The windows on the western side were inclined at a comparatively small angle to the eastern wall of the Town Hall. The basement and ground-floor windows to the south were most affected by loss of light.

The plaintiff purchased the house in 1906 for £1,400, and it was let at 15s. 6d. per week. In 1909, shortly after the defendants commenced the new Town Hall, in consequence of complaints as to the diminution of light, the rent of the premises had to be reduced to 10s. 6d. per week.

Correspondence took place between the solicitors, but no arrangement was made, and consequently the present proceedings had to be commenced.

Mr. Justice Eve: At what sort of figure do you estimate the damage?

Mr. Jessel: The loss of rent is just over £100 a year, and I submit that, as it is a hold house, the loss should be estimated at 10 years' purchase.

Mr. Jessel proceeded to explain the details of the premises with the aid of a model, and in answer to his Lordship said that the side of the Town Hall facing the plaintiff's house was not glazed with white bricks. A line drawn at right angles from the sills of the plaintiff's windows fell on the defendants' buildings. The plaintiff did not claim any injunction.

His first witness was Mr. Reginald Arthur Rix, A.R.I.B.A., a member of the firm of Messrs. Rix & Wilkins, of Budget-Row, E.C. In answer to Mr. Jessel, he said that he owned the plaintiff's premises in January, 1909, and had been the plaintiff's agent on behalf of the plaintiffs. He considered there to be a distinct loss of light owing to the erection of the Town Hall, which was considerably higher than the previous erections on the site. As the plaintiff's windows faced the west, the new building shortened the light from the windows at the sill would be at a much earlier hour than before. That would be particularly felt in the winter, and the consumption of artificial light would be greater. Before the erection of the Town Hall the angle of obstruction of light from the ground-floor windows at the sill would be slightly under 22 deg.; at the present time, being the light at right angles from the sill the ground-floor windows, the angle of obstruction was 55 deg.

Mr. Justice Eve: An increased obstruction of light?—Yes.

Continuing his evidence, Mr. Rix said that his second visit there was a material situation in the amount of light coming to the basement and ground-floor windows. The existing fence round the property darkened the basement window somewhat, but the new building had materially lessened the light.

Cross-examined by Mr. Lawrence, K.C.: He did not before seen such an extraordinary obstruction as the plaintiff's building. He agreed that the plaintiff's windows on the western side had a remarkably clear and open view for that part of London. He did not see the floor area of the rooms, but agreed that the figure of 178 sq. ft. suggested by the Counsel was approximately correct. He did not consider the excellent light enjoyed by the western windows of the upper rooms estimating the loss of light, but had confined his attention to the amount of light which was prevented from reaching the windows.

Mr. Lawrence, K.C.: I suggest that the defendant's room is an exceedingly well-lighted room?—When I was last there, on a day I thought it was only a fairly-lighted room. Did you try the ordinary test of reading any of the room? No.

Did you tell me the day and hour when you last visited the premises?—Witness could not fix the date.

Mr. Justice Eve: Do you consider this Court a well-lighted room? As a court, yes. Applying the same standard to the plaintiff's premises, do you consider the ground-floor room well lighted?—It was fairly well lighted on a bright day.

Mr. Lawrence, K.C.: Because some direct sunlight is taken away you consider the value of the room is considerably depreciated?—Yes.

Mrs. McEwen, the tenant of the premises, said that when she went to live there before the Town Hall was built, the ground-floor room was well lighted; but it had not been so since the Town Hall was finished. The people in the house had complained to her, and she herself had not been able to do her work as a boot machinist with the same comfort. She had also to use artificial light earlier than was the case before.

[The case was proceeding as we went to press.]

LONDON COUNCILS.

Acton.—Application is to be made to the Local Government Board for permission to borrow £500 for resurfacing Greatfield-road with tar macadam, and £900 for resurfacing a portion of Warpleway with granite sets. Plans submitted by the Surveyor for culverting the open ditch in Bello-lane, at an estimated cost of £1,400, have been approved.

Barnet.—The following plans have been passed:—Mr. George Hunt, four shops, Upper Richmond-road; Mr. Sidney Pacey, fourteen houses, Gerard-road; Mr. L. G. Clayton, motor garage, Lonsdale-road; Mr. Henry A. Jones, motor garage, Barnet-road.

Bermondsey.—The tender of Messrs. B. Finch & Co., Ltd., 82, Belvedere-road, S.E., has been accepted for the erection of an animal in Redriff-road. Plans have been passed for Messrs. G. Parker & Sons, 124, Summer-road, Beckenham, S.E., on behalf of Messrs. Hepburn, Gale, & Ross, Ltd., Grange-road, Bermondsey, for a warehouse on the west side of Wright's-buildings, Grange-road.
